Supplemental Noise Analyses

Prepared for:	Jodi Ketelsen / CH2M HILL
Prepared by:	Michael A. Minor
Date:	November 10, 2008
Subject:	Station Noise Levels and Potential Noise Mitigation
Project:	Sound Transit East Link Station Analysis

This memorandum provides a summary of noise levels at existing and proposed East Link light rail stations. As a point of comparison, noise measurements were taken at:

- SR 520 Evergreen Road Flyer Stop (readings taken near the 84th Avenue off-ramp)
- SR 520 Montlake Flyer Stop

Where appropriate, noise abatement measures are discussed. The following stations were examined:

- Rainier Avenue light rail station (I-90 center roadway at the 23rd Avenue over crossing)
- Mercer Island light rail station (I-90 between 77th and 80th Avenues)
- Ashwood/Hospital light rail station (NE 12th Street on overpass above I-405)

Analysis Period

Traffic noise levels on I-90, I-405, and SR-520 are all loudest during mid-day hours of 11:00 a.m. to 3:00 p.m. This is due to the higher speeds and level of truck traffic during daytime hours. Peak commute traffic noise levels on these same highways are typically lower (by 2 to 3 dBA) due to reduced speeds associated with congested highways. Based on these factors, the maximum traffic noise levels during daytime hours were used in the analysis. The analysis also assumes the worst-case, 15-minute headways for the maximum time a person would spend at a platform.

Station Noise Level Guidelines

There are no federal standards for noise exposure on transit passengers at stations due to traffic noise. Sound Transit has established a general design criteria goal of 72 dBA L_{eq} for noise from exterior sources at station platforms. The National Institute for Occupations Safety and Health (NIOSHA) standard for workplace noise exposure is 85 dBA for up to 8 hours, or 100 dBA for 15 minutes (NIOSHA Publication No. 98-126, Occupational Noise Exposure, June 1998). The EPA states that communication at close proximity (2 to 4 feet) can be understood even with ambient noise levels of 72 to 78 dBA ("Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety," EPA/ONAC 550/9-74-004, March, 1974).

Noise measurements were taken at existing bus flyer stops on SR 520. Noise level for the SR 520 Evergreen Road Flyer Stop are derived from readings taken near the 84th Avenue off-ramp as part of the quiet pavement study. The measurements were taken at 75 feet from SR 520, which is close to the distance for the Evergreen Flyer stop. Noise levels at this distance before the quiet pavement was installed ranged from 72 to 75 dBA L_{eq} during daytime hours (7 a.m. to 7 p.m.), reducing to 64 to 66 dBA L_{eq} after midnight. Current noise levels are 4 to 5 dBA lower than this, but in recent measurements, the upper-level hourly L_{eq} noise levels are consistently above 70 dBA L_{eq} at this location.

Noise reading were also taken near the waiting area of the SR 520 Montlake Flyer Stop. Noise levels varied with traffic flow, and the 1-second L_{eq} ranged from 76 to 89 dBA. The typical peak traffic noise level for this station is 81.1 dBA L_{eq}. This shows that the transit riders are currently exposed to high noise levels at transit stops.

There is a potential that, on some station platforms, reducing traffic noise levels to Sound Transit's 72 dBA design goal may not be feasible or reasonable. As stated, it is unlikely that a person would ever spend more than 15 minutes at a station platform. Due to the short period of waiting at platforms, and existing bus-flyer stop noise levels in the region, Sound Transit will use the 78 dBA 15-minute L_{eq} platforms noise level goal for designing stations within or above freeway, where reasonable and feasible.

Noise Measurements

Noise readings were taken at several existing and proposed stations. The measurements were taken in accordance with the American National Standards Institute (ANSI) procedures for community noise measurements. The equipment used for noise monitoring was a Bruel & Kjaer Type 2238 Sound Level Meter. The meter was calibrated prior to and after the measurement period using a Bruel & Kjaer Type 4231 Sound Level Calibrator. Calibration varied by less than 0.1 dB during the measurement periods. Complete system calibration is performed on an annual basis by Bruel & Kjaer Instruments. System calibration is traceable to the National Institute of Standards and Testing (NIST). The system meets or exceeds the requirements for an ANSI Type 1 noise measurement system.

Rainier Avenue Light Rail Station

The Rainier Avenue light rail station would be located along the center of I-90 in a retained cut in the center roadway just west of the Mount Baker Tunnels. This location has large retaining walls along the both sides the highway, resulting in a substantial level of reflected traffic noise. Existing noise levels were measured using a microphone on a 40 foot extension cable dropped over the edge of the 23rd Avenue overpass. The measurement was taken around 11:00 am when traffic on the revisable lanes were changing direction, and only one pass-by was recorded on the reversible lanes. This would most closely resemble the East Link Project scenario. The 15 minute L_{eq} for the existing conditions was measured at 86.3 dBA L_{eq}.

Mercer Island Light Rail Station

The Mercer Island Station would be located along the center of I-90 in a deep retained cut between 77th Avenue and 80th Avenue on Mercer Island. This location has 20- to 25-foot-high retaining walls along each side of the highway, resulting in a substantial level of reflected traffic noise. Existing noise levels were measured at the Mercer Island Station using a microphone on a 40-foot extension cable dropped over the edge of the77th Avenue overpass. This location is shown in Table 1 as R1/M1, and this measurement was used to calibrate the model used to project noise levels at other points within the proposed station. This location was not used to determine the effects traffic noise on passengers as this is merely a pass-through area to the station platform.

Two 10-minute measurements were taken, with the first having a L_{eq} of 86 dBA and the second having an L_{eq} of 88 dBA. For transit stations near major highways, a short-term Leq measurement of 10 minutes is typically long enough to provide an accurate reading of the noise exposure. This is due to the relatively steady noise from passing vehicles on major highways. Measurements at the Mercer Island and NE 12th Street stations provided verification of this, as the running L_{eq} stabilized after only 2 minutes of measurements and varied by less than 1 dBA after 5 minutes, even during heavy truck pass-bys where 1-second L_{eq} sound levels exceeded 92 dBA.

To illustrate this, the 1-second L_{eq} noise levels along with a running-energy average Leq at 10-second intervals was derived and plotted. Figure 1 shows the results of the analysis. The orange dashed lines are the 1-second L_{eq} readings and the black squares are the running-energy average for the measurement period to that point. The plot shows that after approximately 2 minutes, the energy average noise levels remain constant at 88 dBA (+0.3/ -0.5 dBA) for the remainder of the measurement session.

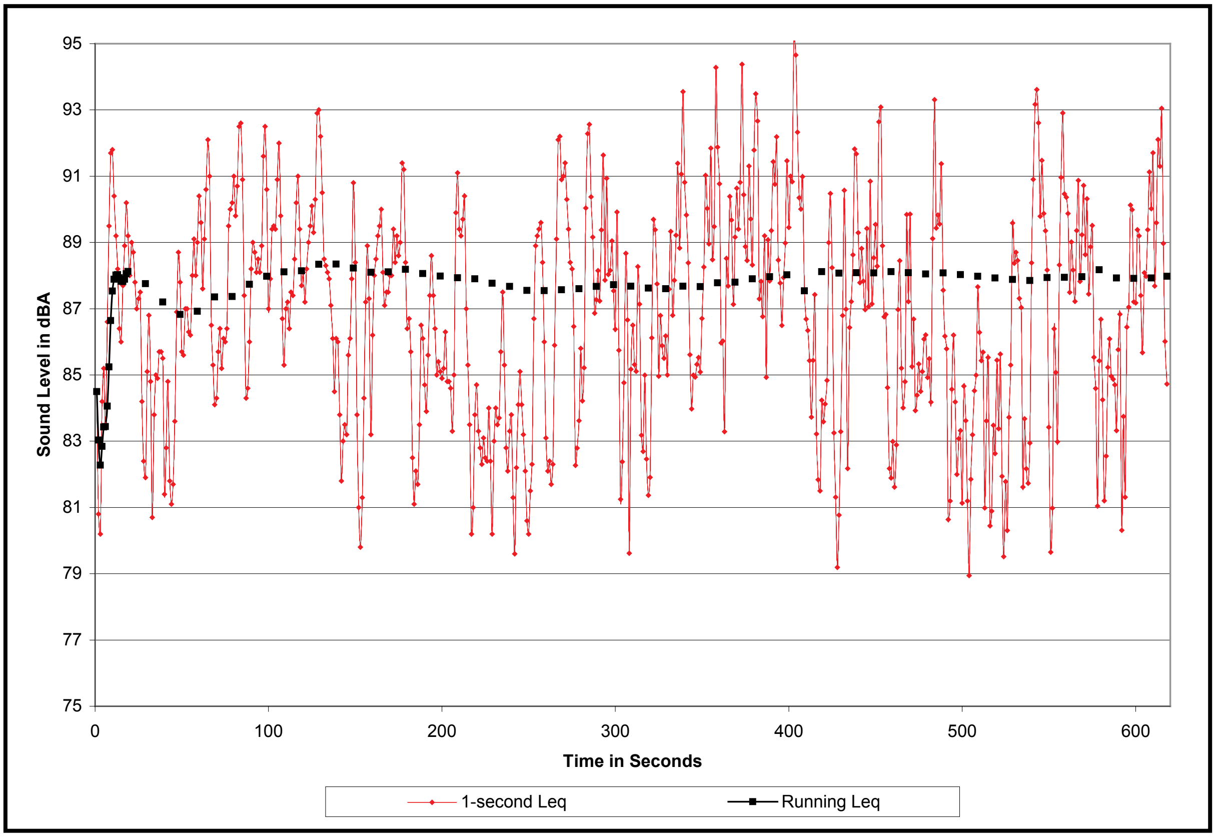

FIGURE 1
Energy Average Leq Noise Levels for Proposed Mercer Island Station

Ashwood/Hospital Light Rail Station

The Ashwood/Hospital light rail station would be located separate and adjacent to the NE 12th Street overpass, approximately 25 feet above I-405. It would be a center platform station, with light rail running on either side of the station platform. On-site noise measurements were performed in the center of the existing overpass on the north side of the NE 12th Street. The dominant noise source was heavy trucks on I-405; however, noise from traffic crossing the overpass was also notable. One-second L_{eq} ranged from 77 to 87 dBA with the overall energy average at this site being 83 dBA L_{eq}.

Noise Modeling

Based on the noise measurements, further analysis was performed for each of the Freeway stations: I-90 Rainier Avenue, Mercer Island and Ashwood/Hospital light rail stations. The models were created using typical daytime traffic volumes and speed from the traffic engineers, a noise model was constructed using the Federal Highway Administration's Traffic Noise Model (TNM). The TNM produces hourly L_{eq} noise levels based on hourly traffic volumes. Because of the constant traffic volumes on major highway like I-90 and I-405, the short-term L_{eq} experienced by patrons at the stations would be the same as the hourly L_{eq}.

Rainier Avenue Light Rail Station Noise Modeling

Because of the high traffic volumes, reflective retaining walls, and close proximity of the traffic to the station, it is unlikely that the noise levels in this area would be able to meet the Sound Transit design guidelines of 72 dBA. Therefore, the 78 dBA 15-minute L_{eq} platforms noise level goal will be applied.

The Rainier Avenue Station noise model was constructed and verified using the measured noise data. Modeled and measured data agreed within +/- 2 dBA Five receivers were located along the platform, with two at each ends and one in the middle. The modeled noise levels ranged from 84.6 to 85.3 dBA L_{eq}, verifying the accuracy of the model against the measured noise levels but also showing that noise levels would exceed the 78 dBA goal.

Figure 2 shows the potential of ten-foot sound walls added to the outside of the light rail alignment, along the edge the I-90 mainlines. With the walls in place, the noise levels along the platform were reduced by 8.2 to 9.7 dBA along the platform. Figure 2 shows the noise measurement and modeling locations and the approximate locations for the sound walls. Table 1 provides a summary of the noise modeling results before and after adding sound walls.

TABLE 1
Rainier Station Noise Analysis

Receiver No.	Measured Levels	Modeled Levels before Noise Walls	Modeled Levels W/ Noise Walls	Noise Wall Reduction	Wall Details
R1	N/A	85.3	76.4	8.9	10 foot walls along the outside of the tracks, between the rail alignment and the I-90 traffic lanes. Walls could be integrated with the crash barriers to save room.
R2	N/A	85.1	76.9	8.2	
R3	N/A	85.0	75.8	9.2	
R4	N/A	84.9	75.2	9.7	
R5	86.3	84.6	75.4	9.2	

The walls would extend approximately 800 feet west of the Mount Baker Tunnel portals. Actual wall design would be performed during project final design. With noise walls the majority of the platform, the noise levels on the platform are within the 78-dBA noise level and no further noise reducing design alternatives were examined.

FIGURE 2
Rainier Avenue Noise Monitoring Modeling and Noise Wall Locations

Mercer Island Light Rail Station Noise Modeling

Because of the high traffic volumes, reflective retaining walls and close proximity of the traffic to the station, it is unlikely that the noise levels in this area would be able to meet the Sound Transit design guidelines of 72 dBA. Therefore, the 78 dBA 15-minute Leq platforms noise level goal will be applied

The Mercer Island Station platform model was constructed and verified using the measured noise data of 86 to 88 dBA Leq as reference sound levels, from the measurement taken at R1/M1. Three receivers were located along the platform, Receiver R1/M1, next to the 77th Avenue overpass, and Receivers R2 and R3, located on the proposed station platform. Passengers would only pass through the location of R1/M1 and the purpose of modeling this receiver is to verify the accuracy of the model. Passengers would spend time waiting at the locations of R2 and R3 and therefore the noise effects of traffic concern only those locations. The modeled noise at all three locations was 88 dBA Leq, which verified the accuracy of the model against the measured noise levels.

Figure 3 and 4 show the potential of 10-foot sound walls added on the outside of the light rail alignment, along the edge nearest the train tracks. With the walls in place the noise levels along the platform would be reduced by 10 dBA in the center of the platform, and 7 to 8 dBA towards the end of the platform. Figures 3 and 4 show the noise measurement and modeling locations as well as the approximate locations for the sound walls. Table 2 provides a summary of the noise modeling results before and after adding sound walls.

TABLE 2
Mercer Island Station Noise Analysis

Receiver No.	Measured Levels	Modeled Levels before Noise Walls	Modeled Levels W/ Noise Walls	Noise Wall Reduction	Wall Details
R2	N/A	87.9	77.6	10.3	10-foot walls along the outside of the tracks, with the base of the wall at the same elevations as the tracks.
R3	N/A	87.9	78.3	9.6	

The majority of the platform will have noise levels near or below the 78-dBA noise level goal and therefore no further noise reducing design alternatives were examined.

Ashwood/Hospital Light Rail Station (NE 12th Street above I-405)

Ashwood/Hospital Station noise modeling was also performed using projected 2030 traffic data and speeds for I-405. The modeled noise levels *without* traffic on NE 12th included in the model was 81 dBA L_{eq} at outer edge of the station where the light rail tracks would be installed. For patrons on the station platforms, noise levels ranged from 75 to 78 dBA L_{eq}. The lower noise levels on the platform are due to the noise-reducing effects of the light rail alignment and bridge over I-405. Because the noise levels at the platform are projected to remain below 78 dBA L_{eq}, no noise-reducing design improvements were investigated.

Subject: Noise Level Projections

Project: Proposed Children's Hospital

This memorandum summarizes the noise level projections for the new Children's Hospital on 116th Ave NE, just north of NE 12th Street. The noise projections assume the following:

1. Distance from the LRT alignment to the building is approximately 100 feet, the distance from the proposed gates is approximately 150 feet and 200 feet (may be further).
2. Speed of the train was modeled at 35 MPH as the worst case scenario.
3. Reference noise levels for typical crossing bells are 72 dBA Lmax at 50 feet (86 dBA at 10 feet). The bells run for approximately 20 seconds.
4. The plan is for one train to pass in either direction every 7 mins in the evening hours including after 10 PM until 1AM and up to one train every 4.5 minutes in the day time.
5. The existing Ldn for traffic near the site is 68 dBA as a conservative (based on 2 dBA lower than the intersection noise level measurement at NE 12th and 116th Avenue NE due to shielding and distance) and the FTA criteria is 63 dBA Ldn for moderate impact and 68 dBA Ldn for severe impacts.

Based on the above information, the noise from LRT operations is predicted at 61 dBA Ldn at the closest point at the proposed hospital and the noise from the crossing bells is predicted at 53 dBA for the same point. The total Ldn is projected at 62 dBA Ldn and no noise impacts are projected.

It is anticipated that modern insulation and noise reduction due to double windows, it is unlikely that noise will be auditable inside the building assuming that the windows are non-open-able.

1.0 Introduction and Summary

This technical report presents a noise and vibration impact study for the Sound Transit East Link Project. The objective of the study was to assess the potential noise and vibration impacts of the planned light rail transit project.

Section 1 of this report describes the background and results of the assessment. Section 2 discusses environmental noise and vibration basics, and Section 3 describes the existing noise and vibration conditions and measurement results. The criteria used to assess noise and vibration impacts are presented in Section 4, and future noise and vibration conditions projections are described in Section 5. Section 6 summarizes the impact assessment, and Section 7 outlines potential mitigation measures. Appendix A includes noise and vibration impacts by affected alternative; Appendix B includes vibration measurement site photographs; Appendix C and Appendix D include detailed noise and vibration measurement data, respectively; Appendix E contains the detailed noise impact assessment data; and Appendix F contains two project memoranda on supplemental noise analyses.

1.1 Background

The proposed project consists of constructing and operating an 18-mile light rail system, known as East Link, between Seattle and Redmond. This system would connect with Sound Transit's Central Link at the International District/ Chinatown Station; travel east across Lake Washington via Interstate 90 (I-90) to Mercer Island, Downtown Bellevue, and Overlake; and terminate in Downtown Redmond. For evaluation purposes, the East Link study area was divided into five segments along distinct geographic boundaries. There are 24 alternatives and 5 design options spread over the following five segments:

- **Segment A, Interstate 90**
  - *Preferred Interstate 90 Alternative (A1)*
- **Segment B, South Bellevue**
  - *Preferred 112th SE Modified Alternative (B2M)*
  - Bellevue Way Alternative (B1)
  - 112th SE At-Grade Alternative (B2A)
  - 112th SE Elevated Alternative (B2E)
  - 112th SE Bypass Alternative (B3)
    - B3 - 114th Extension Design Option
  - BNSF Alternative (B7)
- **Segment C, Downtown Bellevue**
  - *Preferred 108th NE At-Grade Alternative (C11A)*
  - *Preferred 110th NE Tunnel Alternative (C9T)*
    - C9T – East Main Station Design Option
  - Bellevue Way Tunnel Alternative (C1T)
  - 106th NE Tunnel Alternative (C2T)
  - 108th NE Tunnel Alternative (C3T)
  - Couplet Alternative (C4A)
  - 112th NE Elevated Alternative (C7E)
  - 110th NE Elevated Alternative (C8E)
  - 110th NE At-Grade (C9A)
  - 114th NE Elevated (C14E)

- **Segment D, Bel-Red/Overlake**
  - *Preferred NE 16th At-Grade Alternative (D2A)*
    - D2A - 120th Station Design Option
    - D2A - NE 24th Design Option
  - NE 16th Elevated Alternative (D2E)
  - NE 20th Alternative (D3)
  - SR 520 Alternative (D5)
- **Segment E, Downtown Redmond**
  - *Preferred Marymoor Alternative (E2)*
    - E2 - Redmond Transit Center Design Option
  - Redmond Way Alternative (E1)
  - Leary Way Alternative (E4)

Within Segments D and E, there are four alternative sites for a new light rail maintenance facility:

- 116th Maintenance Facility (MF1)
- BNSF Maintenance Facility (MF2)
- SR 520 Maintenance Facility (MF3)
- SE Redmond Maintenance Facility (MF5)

The build alternatives are made up of a range of light rail routes and stations, some with adjoining park-and-ride lots. Maintenance facility alternatives are evaluated separately from the alternative routes and stations.

1.2 Summary of Results

1.2.1 Noise Impact Assessment

The results of the noise analysis indicate that the environment in the project vicinity is already affected by existing noise from traffic on major highways and local roads and from general community noise. Based on Federal Transit Administration (FTA) criteria, the East Link Project is projected, without mitigation, to cause noise impacts at the locations listed in Table 1-1. Detailed information regarding the impacts can be found in Section 6.1 and Appendix D of this report. A number of noise mitigation measures would be considered for the impacts. The two most likely methods of noise mitigation would be sound walls and sound insulation. Sound insulation treatments are typically applied to buildings in areas where walls would not be effective. The final mitigation design will depend on more detailed noise analysis during final design; however, all noise impacts can be mitigated.

In addition to the required noise analyses, Sound Transit conducted an analysis for select stations that are located within or over freeway corridors. These analyses are not reflected in Table 1-1 below. These unique locations present the potential for noise impacts on light rail patrons; however, there are no standards for this type of receptor. With sound walls at some of these stations, projected noise levels at these station locations were found to be within the range identified by the U.S. Environmental Protection Agency (EPA) as appropriate for communication at close distances.

1.2.2 Vibration Impact Assessment

Based on FTA criteria, it is projected that without mitigation, the East Link Project would cause some level of vibration and groundborne noise impacts at the locations listed in Table 1-2. However, these impacts would be related to annoyance impacts and not to building damage impacts. Section 6.2 includes detailed information regarding the impacts, and Section 7.5 discusses proposed mitigation measures. Although most impacts can be mitigated, there might be some residual impacts remaining after mitigation.

There are a number of options available for mitigating vibration impacts. The most common method is ballast mats and high compliance track fasteners. Ballast mats consist of pads made of rubber-like material placed on an asphalt or concrete base with the normal ballast, ties, and rail on top. Because the vibration reduction provided by ballast mats is limited at lower frequencies, their effectiveness is dependent on the frequency content of the vibration. Track fasteners can be used to provide vibration isolation between rails and concrete slabs for direct fixation track on elevated structures or in tunnels. Mitigation measures will be evaluated in more detail during final design, and the most appropriate measures would be selected based on feasibility and cost-effectiveness.

TABLE 1-1
Summary of Potential Noise Impacts and Mitigation Measures

Alternative	Connection Alternatives	Light Rail Impacts		Traffic Noise Impacts[c]	Proposed Mitigation	Locations Considered for Sound Insulation
		Moderate[a]	Severe[b]

TABLE 1-1 CONTINUED
Summary of Potential Noise Impacts and Mitigation Measures

Alternative	Connection Alternatives	Light Rail Impacts[a,b]		Traffic Noise Impacts[c]	Proposed Mitigation	Locations Considered for Sound Insulation
		Moderate[a]	Severe[b]			
Segment E						
Preferred Marymoor Alternative (E2)	All Segment D alternatives	33	148	0	Sound wall, special trackwork, and building insulation	168
E2 - Redmond Transit Center Design Option	All Segment D alternatives	81	100	0	Sound wall, special trackwork, and building insulation	168
Redmond Way Alternative (E1)	All Segment D alternatives	167	150	0	Sound wall, special trackwork, and building insulation	288
Leary Way Alternative (E4)	All Segment D alternatives	66	32	0	Sound wall, special trackwork, and building insulation	48

[a] **Moderate impact:** In this range of noise impact, the change in the cumulative noise level is noticeable to most people but might not be sufficient to cause strong, adverse reactions from the community. In this transitional area, other project-specific factors must be considered to determine the magnitude of the impact and the need for mitigation. These factors include the existing noise level, the projected level of increase over existing noise levels, the types and numbers of noise-sensitive land uses affected, the noise sensitivity of the properties, the effectiveness of the mitigation measures, community views, and the cost of mitigating noise to more acceptable levels.

[b] **Severe impact:** Project-generated noise in the severe impact range can be expected to cause a substantial percentage of people to be highly annoyed by the new noise and represents the most compelling need for mitigation. Noise mitigation will normally be specified for severe impact areas unless there are truly extenuating circumstances that prevent it.

[c] These traffic noise impacts are based on the Federal Highway Administration 66 A-weighted decibel (dBA) equivalent continuous sound level (L_{eq}) impact criteria.

[d] Under Alternative B1 all but nine of the traffic noise impacts would also have light rail noise impacts; conversely, there are only five light rail impacts that would not have traffic noise impacts. The total number of residences impacted (single- and multifamily) under this alternative would be 141; 5 would be impacted by light rail noise only, 9 would be impacted by traffic noise only, and 127 would be impacted by both traffic noise and light rail noise.

[e] Under Alternative B2A all but one of the traffic noise impacts would also have light rail noise impacts. The total number of residences impacted (single- and multifamily) under this alternative would be 79; 62 would be impacted by light rail noise only, 1 would be impacted by traffic noise only, and 16 would be impacted by both traffic noise and light rail noise.

[f] Under Alternatives B3 and B3 – 114th Extension Design Option all but one of the traffic noise impacts would also have light rail noise impacts. For B3, the total number of residences impacted (single- and multifamily) would be 84; 67 would be impacted by light rail noise only, 1 would be impacted by traffic noise only, and 16 would be impacted by both traffic noise and light rail noise. For B3 – 114th Extension Design Option, the total number of residences impacted (single- and multifamily) would be 78; 61 would be impacted by light rail noise only, 1 would be impacted by traffic noise only, and 16 would be impacted by both traffic noise and light rail noise.

[g] Under Alternative C1T all the traffic noise impacts are separate from light rail noise impacts. The total number of residences impacted (single- and multifamily) under this alternative would be 118; 100 would be impacted by light rail noise only, 18 would be impacted by traffic noise only, and 0 would be impacted by both traffic noise and light rail noise.

TABLE 1-2
Summary of Potential Vibration Impacts

		Before Mitigation		**After Mitigation**	
Alternative	**Connection Alternatives**	**Number of Vibration Impacts**[a]	**Number of Groundborne Noise Impacts**[b]	**Number of Vibration Impacts**	**Number of Groundborne Noise Impacts**[b]

2.0 Environmental Noise and Vibration Basics

2.1 Noise Fundamentals and Descriptors

What humans perceive as sound is a series of continuous air pressure fluctuations superimposed on the atmospheric pressure that surrounds us. The amplitude of fluctuation is related to the energy carried in a sound wave; the greater the amplitude, the greater the energy, and the louder the sound. The full range of sound pressures encountered in the world is so great that it is more convenient to compress the range by using a logarithmic scale, resulting in the fundamental descriptor used in acoustics, the sound pressure level, which is measured in decibels (dB). When sounds are unpleasant, unwanted, or disturbingly loud, we tend to classify them as noise.

Another aspect of sound is the quality described as its pitch. Pitch of a sound is established by the frequency, which is a measure of how rapidly a sound wave fluctuates. The unit of measurement is cycles per second, called hertz (Hz). When a sound is analyzed, its energy content at individual frequencies is displayed over the frequency range of interest, usually the range of human audibility from 20 Hz to 20,000 Hz. This display is called a frequency spectrum.

Sound is measured using a sound-level meter with a microphone designed to respond accurately to all audible frequencies. However, the human hearing system does not respond equally to all frequencies. Low-frequency sounds below about 400 Hz are progressively and severely attenuated, as are high frequencies above 10,000 Hz. To approximate the way humans interpret sound, a filter circuit with frequency characteristics similar to the human hearing mechanism is built into sound-level meters. Measurements with this filter enacted are called A-weighted sound levels, expressed in A-weighted decibels (dBA). Community noise is usually characterized in terms of the A-weighted sound level. Exhibit 2-1 illustrates the A-weighted levels of common sounds.

The range of human hearing extends from about 0 dBA for young healthy ears (that have not been exposed to loud noise sources) to about 140 dBA. When sounds exceed 110 dBA, there is a potential for hearing damage, even with relatively short exposures. In quiet suburban areas far from major freeways, the noise levels during the late night hours will drop to about 30 dBA. Outdoor noise levels lower than this only occur in isolated areas where there is a minimum even of natural noises, such as leaves blowing in the wind, crickets, or flowing water.

Another characteristic of environmental noise is that it is constantly changing. The noise-level increase when a train passes is an example of a short-term change. The lower average noise levels occur during nighttime hours, when activities are at a minimum, and higher noise levels during daytime hours are caused by daily patterns of noise-level fluctuation. The instantaneous A-weighted sound level is insufficient to describe the overall acoustic "environment." Thus, it is common practice to condense the fluctuating noise levels into a single number, called the "equivalent" sound level (Leq). Leq can be thought of as the steady sound level that represents the same sound energy as the varying sound levels over a specified time period (typically 1 hour or 24 hours). Often the Leq values over a 24-hour period are used to calculate cumulative noise exposure in terms of the Day-Night Equivalent Sound Level (Ldn, also abbreviated DNL), which is defined as the 24-hour Leq but with a 10-dB penalty assessed to noise events occurring at night (defined as 10 p.m. to 7 a.m.). The effect of this penalty is that any event during nighttime hours is equivalent to 10 events during the daytime. This strongly weights Ldn toward nighttime noise to reflect most people being more easily annoyed by noise at night, when background noise is lower and most people are resting.

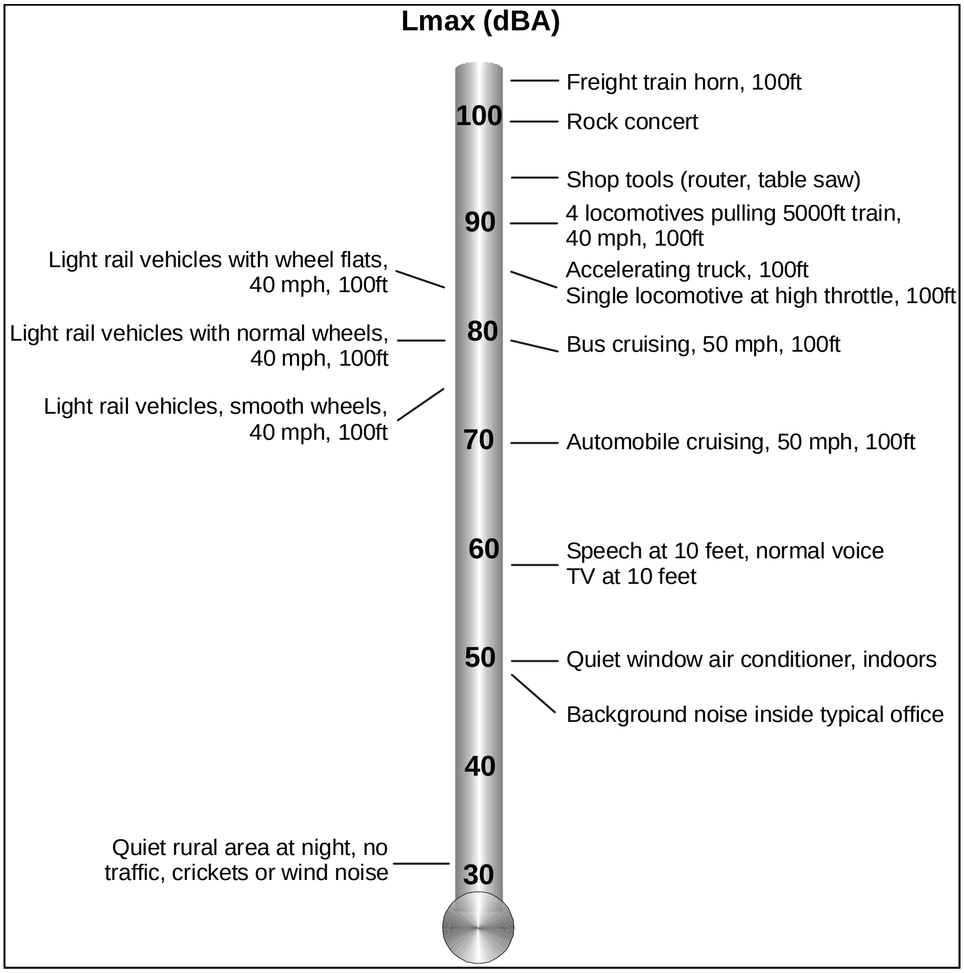

EXHIBIT 2-1
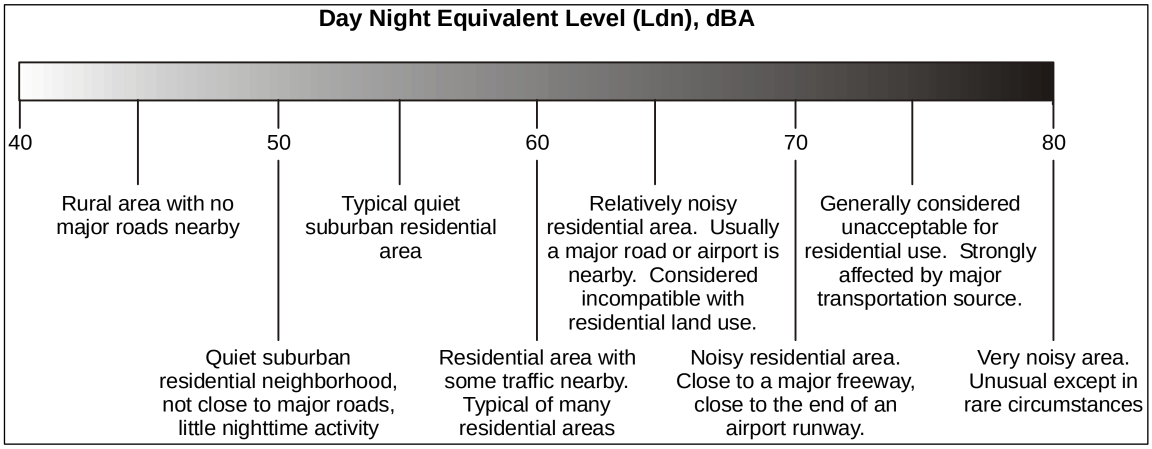
Comparison of Various Noise Levels

Environmental impact assessments for high-capacity transit projects in the United States typically use Ldn to describe the community noise environment at residential locations. Studies of community response to a wide variety of noises indicate that Ldn is a good measure of the noise environment. Efforts to derive measures that are better correlated to community response have not been successful, although there are still efforts in the acoustical community to develop improved measures. Exhibit 2-2 defines typical community noise levels in terms of Ldn. Most urban and suburban neighborhoods are usually in the range of Ldn 50 dBA to 70 dBA. An Ldn of 70 dBA is a relatively noisy environment that might be found at buildings on a busy surface street, close to a freeway, or near a busy airport and would usually be considered unacceptable for residential land use without special measures taken to enhance outdoor-indoor sound insulation. Residential neighborhoods that are not near major sound sources are usually in the range of Ldn 55 dBA to 60 dBA. If there is a freeway or moderately busy arterial nearby, or any nighttime noise, Ldn is usually in the range of 60 to 65 dBA.

Ldn is the designated noise metric of choice for many federal agencies, including the Department of Housing and Urban Development (HUD), Federal Aviation Administration (FAA), FTA, and EPA. Although Ldn does have recognized limitations and there is still considerable discussion within the acoustical community about whether improved metrics are possible, there is general consensus that Ldn, or similar energy-based metrics, are the best available means of describing community noise environments. Most federal and state agency criteria for noise impacts are based on some measurement of noise energy. For example, the FAA and HUD use Ldn, and the Federal Highway Administration (FHWA) uses peak hour Leq. The noise impact criteria applicable to residential areas, and included in the FTA manual *Transit Noise and Vibration Impact Assessment*, use both Leq and Ldn to characterize community noise.



Day Night Equivalent Level (Ldn), dBA
40
50
60
70
80
Rural area with no major roads nearby
Typical quiet suburban residential area
Relatively noisy residential area. Usually a major road or airport is nearby. Considered incompatible with residential land use.
Generally considered unacceptable for residential use. Strongly affected by major transportation source.
Quiet suburban residential neighborhood, not close to major roads, little nighttime activity
Residential area with some traffic nearby. Typical of many residential areas
Noisy residential area. Close to a major freeway, close to the end of an airport runway.
Very noisy area. Unusual except in rare circumstances

EXHIBIT 2-2
Examples of Typical Outdoor Noise Exposure

The Washington State Administrative Code (WAC) uses the maximum noise level with a set of allowable exceedances in their noise control ordinance, which is applicable to the noise analysis of ancillary facilities such as park-and-ride lots and maintenance facilities, as well as construction activities. To qualify the allowable exceedances, the commonly used noise metric—the Lnn—is used for compliance verification. The sound level descriptor Lnn is defined as the sound level exceeded "n" percent of the time. For example, the L25 is the sound level exceeded 25 percent of the time; therefore, during a 1-hour measurement, an L25 of 60 dBA means the sound level equaled or exceeded 60 dBA for 15 minutes during that hour. More detailed information on the WAC is provided in Section 4.4.1.

2.2 Vibration Fundamentals and Descriptors

Groundborne vibration is the oscillatory motion of the ground about some equilibrium position, which can be described in terms of displacement, velocity, or acceleration. Displacement refers to the distance an object moves away from its equilibrium position. Velocity refers to the rate of change in displacement or the speed of this motion. Acceleration refers to the time rate of change in the velocity of the object. At any given frequency of oscillation, vibration displacement, velocity, and acceleration are related. However, the relationship between these descriptors is complex and can vary greatly in different situations. Therefore, the relationship between the overall vibration levels in terms of these descriptors depends on the frequency content of the vibration energy.

Although displacement is easier to understand than velocity or acceleration, it is rarely used for describing groundborne vibration. One reason for this is that most sensors used for measuring groundborne vibration are designed to provide output signals proportional to either velocity or acceleration. Even more important, the response of humans, buildings, and equipment to vibration is more accurately described using velocity or acceleration. Because sensitivity to vibration typically corresponds to a constant level of vibration-velocity amplitude within the low-frequency range that is of most concern for environmental vibration (i.e., roughly 5 to 100 Hz), vibration velocity is used in this analysis as the primary measure to evaluate the impacts of vibration.

There are several different measures used to quantify vibration amplitude. One of the most common is the peak particle velocity (PPV), defined as the maximum instantaneous positive or negative peak of the vibratory motion. PPV is often used to monitor blasting vibration because it is related to the stresses experienced by building components. Although PPV is appropriate for evaluating the potential for building damage, it is less suitable for evaluating human response, which is better related to an average vibration amplitude. Because the net average of a vibration signal about its equilibrium position is zero, the root mean square (rms) amplitude is often used to describe the "smoothed" vibration amplitude. The rms amplitude is defined as the square root of the average of the squared amplitude of the signal and is typically evaluated over a 1-second period of time.

Although vibration velocity is normally described in units of inches per second in the United States, the decibel notation, which acts to compress the range of numbers required to describe vibration, can also be used. In this notation, the vibration magnitude can be expressed in terms of velocity level, in decibels, defined as follows:

$$L_v = 20\log_{10}(v/v_{ref}),\ \text{VdB}$$

where:

v = rms velocity, inches/second
v_{ref} = 1×10^{-6} inches/second

Thus, the descriptor used for this assessment of groundborne vibration is the rms vibration velocity level, Lv, expressed in vibration decibels (VdB) relative to one micro-inch per second. Exhibit 2-3 illustrates typical groundborne vibration levels for common sources, as well as human and structural response to groundborne vibration. As shown, the range of interest is from approximately 50 VdB to 100 VdB (i.e., from imperceptible background vibration to the threshold of damage). Although the threshold of human perception to vibration is approximately 65 VdB, annoyance does not usually occur unless the vibration exceeds 70 VdB.

EXHIBIT 2-3
Typical Groundborne Vibration Levels and Human/Structural Response

When groundborne vibrations propagate from transit vehicles to nearby buildings, the floors and walls of the building structure will respond to the motion and may resonate at natural frequencies. The vibration of the walls and floors may cause perceptible vibration, rattling of items such as windows or dishes on shelves, or a rumbling noise. The rumble is the noise radiated from the motion of the room surfaces. In essence, the room surfaces act like a giant loudspeaker. This is called groundborne noise.

The potential annoyance of groundborne noise is often assessed using the A-weighted sound level, although there are potential problems in using the A-weighted sound level to characterize low-frequency groundborne noise. Human hearing is non-linear, which causes sounds with substantial low-frequency content to seem louder than broadband sounds that have the same A-weighted level. This is accounted for by setting A-weighted impact criteria limits lower for groundborne noise than would be the case for broadband noise.

3.0 Existing Conditions

The project corridor was examined to identify noise-sensitive locations and to select locations where noise monitoring would be performed. The following sections describe the land use along the project corridor, the existing noise-level measurements, and the current noise sources in the project corridor. While a more detailed presentation of land use can be found in Section 4.3, Land Use, in Chapter 4 of the East Link Final Environmental Impact Statement (EIS), the following land uses are summarized for their potential sensitivity to noise and vibration. Most identified land uses are sensitive to both noise and vibration. The exceptions include outdoor parks, which may be noise-sensitive, depending on usage, but are not vibration-sensitive, and vibration-sensitive equipment (such as an MRI), which is not sensitive to noise. Exhibits 3-1 through 3-5 show the different alternatives, noise monitoring locations, and existing land uses.

3.1 Land Use

3.1.1 Segment A

The Central Link connection to the East Link Project corridor is located in the International/Chinatown District, which is within walking distance to Downtown Seattle and Pioneer Square to the north, sports stadiums to the west and south, and an industrial area also to the south. Land use near the connection is mainly commercial; however, the route is already in the existing transit tunnel and therefore would not have the potential to affect adjacent land uses. The route continues along the 5th Avenue ramps of I-90, remaining in the existing I-90 corridor to the I-90 tunnel portals. I-90 crosses I-5, passing by predominantly commercial uses to the north and large greenbelt parks, residential, and commercial uses on Beacon Hill to the south. Land use along this section of the route is mainly commercial until 12th Avenue South, where there is a large group of single-family and multifamily residences along Sturgus Avenue South. Several single-family residences are also located above the Mount Baker Ridge Tunnel. The route then transitions from the tunnel to the floating bridge in an area that is also primarily single-family residential.

The I-90 corridor and light rail routes are well below grade across Mercer Island. At the western end of the island, near the I-90 bridge and tunnel, land use is residential. Most residences in this area are more than 300 feet from the proposed light rail route. Land use near the proposed Mercer Island Station includes a new park-and-ride structure and single-family residences to the north and a large multifamily building to the east. West and south of the station are the highway and connector roadways that lead to the I-90 on- and off-ramps. Also to the south of the station are midrise, mixed-use developments that either are under construction or newly opened. At the eastern end of Mercer Island, land use is primarily single-family residential with some commercial use to the south of I-90.

Parks in Segment A include Judkins Park and Playfield located near the entrance to the Mount Baker Ridge Tunnel and Sam Smith Park located above the tunnel. Other parks in Segment A include Daejeon Park and East Portal Park. There are also several parks on Mercer Island, including Park on the Lid and Luther Burbank Park, both of which are near I-90. None of these parks are considered noise-sensitive under the FTA criteria because of their proximity to I-90 and the high existing noise levels.

3.1.2 Segment B

Land use in Segment B consists primarily of residences and parks, with some institutional and commercial uses. Land use in the southern end of Segment B, near Lake Washington, includes single-family residences and Enatai Beach Park. Along the west side of the Bellevue Way SE, land use is entirely residential from SE 34th Street to the intersection at 112th Avenue SE. Mercer Slough Nature Park dominates the east side of Bellevue Way. Along Bellevue Way SE between 112th Avenue SE and where Segment C begins, land use is also primarily residential; however, there are also several churches, commercial structures, and a daycare in this portion of Segment B.

The Winters House, a historic structure used for nonresidential uses, is located along the east side of Bellevue Way SE, adjacent to the Mercer Slough Nature Park. Along 112th Avenue SE, land use to the west is entirely single- and multifamily residential; to the east, land use is commercial between the intersection of Bellevue Way and SE 8th Street, transitioning to mixed commercial and hotel use from SE 8th Street to Segment C at

Exhibit 3-5 **Noise Monitoring and Vibration Measurement Locations and Land Use Segment E**

East Link Project

SE 6th Street. Land use along the BNSF Alternative (B7) is primarily parkland north of the route, with some multifamily and commercial land uses where the alternative transitions to the former BNSF Railway corridor. Land use along the former BNSF Railway corridor includes multifamily residential and some commercial between SE 32nd Street and SE 8th Street.

Parks in Segment B include the Enatai Beach Park and the Mercer Slough Nature Park. Portions of the Enatai Beach Park and the Mercer Slough Nature Park that could be affected by the proposed project are near a major highway or major arterial roadways, including I-90 and Bellevue Way SE, and therefore are not considered noise-sensitive under FTA criteria. The only parklands in Segment B considered noise-sensitive under the FTA criteria are interior portions of Mercer Slough Nature Park, which are 350 feet or more from the proposed alternatives.

3.1.3 Segment C

Land uses in the southern section of Segment C consists of the Surrey Downs residential area and park, transitioning to commercial and office use at Main Street. Land uses along Bellevue Way and 112th Avenue SE south of Main Street are similar as in Segment B. There are some mixed-use buildings in Downtown Bellevue, with commercial uses on the ground floors and residential units on the upper floors. The Downtown Park is located near the Bellevue Way Alternative (C1T) west of Bellevue Way. Some Segment C alternatives pass by the Bellevue City Hall, the Meydenbauer Convention Center, the Bellevue Regional Library, and Ashwood Park.

In addition, residential land uses were identified along the northern edge of Downtown Bellevue. There are several multifamily residential units along 108th Avenue NE, 110th Avenue NE, and 112th Avenue NE near NE 12th Street. The Bellevue Regional Library and Ashwood Park are also located near NE 12th Street. McCormick Park is located on the north side of NE 12th Street, between 112th Avenue NE and 106th Place NE. North of McCormick Park, land use is primarily single- and multifamily residential.

Noise-sensitive land uses east of I-405 include Overlake Hospital, Group Health Medical Center, and a broad range of medical offices supporting the hospital. There is also a multifamily residential area at the north end of Lake Bellevue, along NE 12th Street.

Surrey Downs Park, an active park with playfields; Downtown Park; Ashwood Park; and McCormick Park were all reviewed for their sensitivity to noise. Because all these parks do not have noise-sensitive uses, and are located along established transportation corridors, none meet the FTA criteria for a noise-sensitive use.

3.1.4 Segment D

Land uses in the Segment D portion of the project are mainly commercial and light industrial, including retail, distribution facilities, and office spaces. There are single- and multifamily residences along 116th Avenue NE, north of NE 12th Street. There is also a multifamily residential structure along NE 21st Place, just south of State Route (SR) 520. The Pacific Northwest Ballet School is located on NE 16th Street and 136th Place NE. No other residential land use was identified near the light rail alternatives between Segment C and Overlake Center.

The noise-sensitive land use in the Overlake area is an assisted living facility. In addition, the former Eastside Hospital property is being redeveloped to a mixed residential and commercial use facility. The remaining land use in Segment D is commercial, including the Microsoft Campus and several retail complexes.

The only park in Segment D near any of the proposed alternatives is the Highland Park and Community Center, an active recreation facility with sports fields, near the NE 20th Alternative (D3). Since this park does not have noise-sensitive uses, and is located along established transportation corridors, it does not meet the FTA criteria for a noise-sensitive use.

3.1.5 Segment E

All light rail alternatives in Segment E begin at the Overlake Transit Center in the commercial area near the NE 40th Street SR 520 overpass. North of NE 51st Street, land use changes to single-family residential. Most residences in this area are located behind a sound wall along SR 520. Land use remains single-family residential to the West Lake Sammamish Parkway exit, where land uses change to multifamily residential, park, and commercial land uses south of Downtown Redmond. The *Preferred Marymoor Alternative (E2)* follows SR 520 just north of Marymoor Park, while the Redmond Way (E1) and Leary Way (E4) Alternatives pass through multifamily and commercial areas adjacent to NE Redmond Way and Leary Way.

Land use in the Downtown Redmond area varies but is mainly commercial and retail, with some mixed-use buildings with residential use on their upper floors. There are also several hotels in Downtown Redmond, including the Residence Inn on 164th Avenue NE and the Redmond Inn on Redmond Way near the proposed SE Redmond Station.

Other land uses in Segment E include Marymoor Park, and several other parks and green spaces, including Luke McRedmond Landing Park; Dudley Carter Park; the Edge Skate Park; and the Sammamish River, East Lake Sammamish and Bear Creek trails. All of these parks are near SR 520 and other major arterial roadways and are not considered noise-sensitive under FTA criteria due to active park uses and high existing noise levels. The one exception to this review is the portion of Marymoor Park that is near Lake Sammamish, which is 2,500 to 3,000 feet from the above-mentioned transportation noise sources, and is a portion of the park where low noise levels are part of its intended purpose. This portion of the park would be considered noise-sensitive under FTA criteria.

3.2 Noise Measurements

The existing noise environment was characterized through on-site inspections and on-site noise monitoring. Monitoring was performed at 55 locations, including 21 long-term (24-hour or greater) and 34 short-term (20-minute) sites. Exhibits 3-1 through 3-5 show the locations of the noise monitoring sites. The exhibits also show land use in the project vicinity and light rail alternatives. Selection of monitoring sites was based on land use, existing noise sources, alternative proximity and profile type, and ability to represent nearby noise-sensitive land uses.

All noise measurements were taken in accordance with the FTA manual *Transit Noise and Vibration Impact Assessment* and the American National Standards Institute (ANSI) procedures for community noise measurements and guidelines provided in the FTA manual. Measurement locations were at least 5 feet from any solid structure to prevent acoustical reflections and at a height of 5 feet off the ground as required by FTA and ANSI standards. The equipment used for noise monitoring included Bruel & Kjaer Type 2238 Sound Level Meters and a Larson Davis Model 820 Sound Level Meter. The meters were calibrated before and after measurement periods using a sound-level calibrator. Complete system calibration is performed on an annual basis by an accredited testing laboratory. The laboratory system calibration is traceable to the National Institute of Standards and Technology (NIST). The systems meet or exceed the requirements for an ANSI Type 1 or Type 2 noise measurement systems.

For long-term monitoring locations, the Ldn was calculated using logarithmic energy averaging for the 24-hour data with a 10-dBA penalty for noise measured between 10 p.m. and 7 a.m. For short-term monitoring locations, the Ldn levels were projected using formulas in the FTA manual *Transit Noise and Vibration Impact Assessment* and comparison to other nearby long-term noise monitoring sites.

The following sections describe the existing noise environment by project segments.

3.2.1 Segment A

Segment A had one long-term and four short-term monitoring locations. Noise levels along the proposed light rail alternative in Segment A are dominated by traffic noise from area highways, including I-5, I-90, and major arterial roadways such as Airport Way and Rainier Avenue South. The modeled Ldn near *Preferred Interstate 90 Alternative (A1)* in the Seattle area was 69 dBA. Peak-hour noise levels measured at two different representative locations ranged from 67 to 68 dBA Leq.

Near the entrance to the Mercer Island Tunnel, the modeled Ldn was 65 dBA and the measured peak-hour Leq was 65 dBA. At residences near the existing Mercer Island Park-and-Ride Lot, the modeled Ldn was 54 dBA and the measured peak-hour noise level was 51 dBA Leq. The measured Ldn at the east end of Mercer Island was 55 dBA and the peak-hour Leq was 56 dBA. It is also important to note that the short-term maximum noise levels in Segment A, which is dominated by heavy trucks on I-90, frequently exceeded 74 to 81 dBA maximum noise level (Lmax). Table 3-1 summarizes the noise monitoring for Segment A, and Exhibit 3-1 shows the monitoring sites.

TABLE 3-1
Segment A Noise Measurements and Modeled 24-Hour Ldn

Monitoring Location No. [a]	Address	Land Use Type	Type of Measurement	Leq (peak-hour Leq in dBA)	Ldn (24-hour Ldn in dBA)
MA-1	Taejon Park	Park	Short-term	68	69
MA-2	East Portal Park	Park	Short-term	68	69
MA-3	West Mercer Way Park	Park	Short-term	65	65
MA-4	2257 80th Avenue SE	Single-family	Short-term	51	54
MA-5	3700 East Mercer Way	Single-family	Long-term	56	55

[a] Sites shown on Exhibit 3-1.

3.2.2 Segment B

Segment B has the highest number of noise-sensitive receivers and, therefore, had the highest number of noise-monitoring locations. There were 20 noise monitoring locations in Segment B, including 7 long-term sites and 13 short-term sites. Measured existing Ldn ranged from 53 to 72 dBA. Overall peak-hour noise levels in south Bellevue ranged from 50 to 72 dBA Leq. The highest noise levels were measured at locations near I-90 and along 112th Avenue SE and Bellevue Way SE. The main source of noise in Segment B is traffic on I-90, Bellevue Way SE, I-405, and 112th Avenue SE, with heavy trucks producing the highest average noise levels.

Measured peak-hour noise levels at Enatai Beach Park were 62 dBA Leq. Noise levels at this location are lower than other locations near I-90 because the site is well below the highway and is shielded somewhat from traffic noise by crash barriers. For the residential areas along SE 34th Street (noise monitoring sites MB-2 through MB-4), the Ldn was modeled to range from 66 to 72 dBA, with peak-hour noise levels from 64 to 72 dBA Leq.

Existing noise levels at residential land uses along the southern end of Bellevue Way (MB-5 though MB-9) ranged from 53 to 72 dBA Ldn. Site MB-7 is located uphill from Bellevue Way, with some shielding from roadway noise by existing topography, resulting in lower noise levels in this area. The locations with the highest measured levels are directly adjacent to Bellevue Way and have little or no shielding from the roadway. Noise levels along the northern section of Bellevue Way SE (MB-10 through MB-13), from 112th Avenue SE to SE 6th Street, ranged from 60 to 67 dBA Leq during peak hours, and the Ldn ranged from 62 to 69 dBA. Maximum noise levels between I-90 and 112th Avenue SE ranged from 67 to 80 dBA Lmax, with an average of 74 dBA Lmax. The highest noise levels were measured at locations near I-90 and along Bellevue Way.

Along 112th Avenue SE, north of the intersection with Bellevue Way, for *Preferred Alternative B2M* and the 112th SE At-Grade (B2A), 112th SE Elevated (B2E), and 112th SE Bypass (B3) Alternatives, the Ldn ranged from 55 to 66 dBA, with peak-hour levels ranging from 55 to 62 dBA Leq (MB-14, MB-15, MB-18, and MB-19). North of the intersection of 112th Avenue SE and Bellevue Way, maximum noise levels on Bellevue Way or along 112th Avenue SE and vicinity ranged from 75 dBA Lmax to over 96 dBA Lmax. For Alternative B7 along I-405, noise levels at the nearby multifamily units were measured at 58 to 65 dBA Leq and the Ldn levels were modeled to range from 60 to 69 dBA (MB-16, MB-17, and MB-20). The multifamily units along the former BNSF Railway corridor are somewhat shielded from I-405 traffic noise by topographical conditions and a recently installed sound wall near monitoring site MB-20. Table 3-2 summarizes the noise measurements and projections for Segment B, and Exhibit 3-2 shows the monitoring sites.

[a] Sites shown on Exhibit 3-2.

3.2.3 Segment C

There were 19 noise-monitoring locations in Downtown Bellevue, including 9 long-term sites and 10 short-term sites. Peak-hour noise levels ranged from 55 dBA Leq in quiet areas away from major arterial roads to 75 dBA Leq near the Hilton Hotel along I-405 (monitoring site MC-3). The modeled Ldn at the Hilton Hotel was 75 dBA. Noise levels at residences along Bellevue Way ranged from 66 dBA Ldn for properties near the roadway to 60 dBA Ldn for properties shielded from roadway noise. For front-line residences along 112th Avenue SE (represented by MC-15), the measured peak-hour noise level was 68 dBA Leq and the Ldn was 70 dBA.

Along 112th Avenue north of Surrey Downs Park, noise levels are dominated by local traffic and vehicles on I-405. Measured traffic noise levels in this area ranged from 57 (at MC-5) to 75 (at MC-3) dBA Leq, depending on the proximity to the roadway and shielding from existing structures. Noise levels at single-family residences along NE 12th Street ranged from 60 dBA Ldn for shielded properties (MC-13) increasing to as high as 70 dBA Ldn (MC-15) for residences directly adjacent to major arterial roads. The measured noise level at the Bellevue Regional Library (MC-10) was 62 dBA Leq. Noise levels for residences near NE 12th Street ranged from 60 dBA Ldn at MC-13 to 70 dBA Ldn at MC-15. Finally, noise levels near Lake Bellevue (MC-19) were measured at 58 dBA Ldn. Maximum noise levels in Segment C ranged from 68 to 90 dBA Lmax, with maximum noise levels along 112th Avenue SE consistently in the mid to upper 80 decibel range. For example, over a 70-hour measurement period the Lmax at the condominiums on 112th Avenue SE (MC-15) ranged from 70 to 93 dBA Lmax, with an average Lmax of 80 dBA Lmax. Table 3-3 summarizes the noise measurements and modeled 24-Hour Ldn for Segment C, and Exhibit 6 shows the monitoring sites.

TABLE 3-3
Segment C Noise Measurements and Modeled 24-Hour Ldn

Monitoring Location No. [a]	Address	Land Use Type	Type of Measurement	Leq (peak-hour Leq in dBA)	Ldn (24-hour Ldn in dBA)
MC-1	420 Bellevue Way SE	Multifamily	Short-term	66	66

[a] Sites shown on Exhibit 3-3.

3.2.4 Segment D

Because much of Segment D is commercial and light industrial uses, which are not typically sensitive to light rail noise, only six sites were monitored, with only one long-term monitoring site at a residential area along 116th Avenue NE. Noise levels for these residences were dominated by traffic on I-405 and 116th Avenue NE. An Ldn of 58 dBA was measured along the side of 116th Avenue NE facing the SR 520 Alternative (D5), which is well shielded from I-405. There was also a monitoring location near the Highland Park and Community Center, where the peak-hour level was measured at 65 dBA Leq. The main noise sources included SR 520, Bel-Red Road, and NE 20th Street.

Three additional noise measurement sites were located near the Overlake area, including one near the former Group Health Eastside Hospital, one at the Overlake Assisted Living Center, and one on the Microsoft Campus near Building 44. Estimated noise levels at these sites ranged from 65 to 71 dBA Ldn, with measured peak hour Leq levels ranging from 64 to 70 dBA Leq. Finally, a short-term monitoring session was performed at the Pacific Northwest Ballet School on NE 16th Street to assist with analysis of potential impacts at the school. The measured daytime noise level at the school was 56 dBA Leq, while the maximum noise level of 83 dBA Lmax was due to truck traffic. Table 3-4 summarizes the noise measurements and modeled 24-Hour Ldn for Segment D, and Exhibit 3-4 shows the monitoring sites.

TABLE 3-4
Segment D Noise Measurements and Modeled 24-Hour Ldn

Monitoring Location No.[a]	Address	Land Use Type	Type of Measurement	Leq (Peak-hour Leq in dBA)	Ldn (24-hour Ldn in dBA)
MD-1	1815 116th Avenue NE	Single-family	Long-term	58	58
MD-2	Near Highland Park (on pathway 50 feet from NE 20th Street)	Park	Short-term	65	65
MD-3	Former Group Health Campus, 2700 152nd Avenue NE (to be redeveloped as mixed use)	Commercial	Short-term	64	65
MD-4	Overlake Assisted Living Center, 2956 152nd Avenue NE	Commercial	Short-term	64	65
MD-5	Near Microsoft Building 44	Mixed-use	Short-term	70	71
MD-6	13440 NE 16th Street (Pacific Northwest Ballet School)	Mixed-use	Short-term	56	56

[a] Sites shown on Exhibit 3-4.

3.2.5 Segment E

There were five noise-monitoring locations in Segment E—two long-term sites and three short-term sites The initial portion of all light rail alternatives in Segment E is along the east side of SR 520, shielded from nearby residences by existing sound walls. For locations with existing sound walls (represented by ME-1), Ldn ranged from 60 to 64 dBA, with peak-hour levels of 58 to 60 dBA Leq. A small group of homes along 156th Avenue NE does not have a sound wall (ME-2), and the measured Ldn was 68 dBA at this location.

Noise at the multifamily units along 156th Place NE (ME-4) was also dominated by traffic on SR 520 and arterial roads, with an estimated Ldn of 64 dBA. The apartments along NE Leary Way and West Lake Sammamish Parkway (ME-5) had an estimated Ldn of 64 dBA, with most noise coming from the two main arterial roadways. Table 3-5 summarizes the noise measurements and modeled 24-hour Ldn for Segment E, and Exhibit 3-5 shows the monitoring sites.

TABLE 3-5
Segment E Noise Measurements and Modeled 24-Hour Ldn

Monitoring Location No.[a]	Address	Land Use Type	Type of Measurement	Leq (Peak-hour Leq in dBA)	Ldn (24-hour Ldn in dBA)
ME-1	5409 154th Avenue NE	Single-family	Long- term	60	64
ME-2	15516 61st Court	Single-family	Long-term	65	68
ME-3	15834 NE 67th Place	Single-family	Short-term	58	60
ME-4	7250 Old Redmond Road	Multifamily	Short-term	63	64
ME-5	15821 Leary Way NE	Multifamily	Short-term	62	64

[a] Sites shown on Exhibit 3-5.

3.2.6 Maintenance Facilities

The maintenance facilities are proposed in areas that are currently light industrial land uses and have no nearby noise-sensitive land uses. The exception is the 116th Maintenance Facility (MF1) (see Exhibit 3-4), where some residences are located to the west between 116th Avenue NE and I-405, and the new Children's Hospital Bellevue Clinic and Surgery Center (BCSC) is located to the south. The maintenance facility sites in Segment D are characterized by monitoring data discussed in Section 3.2.4. Existing background noise levels for the maintenance facility sites in Segment E are discussed in Section 3.2.5.

3.3 Vibration Measurements

3.3.1 Locations and Tests

Vibration measurement test sites were selected based on a review of aerial photographs and were supplemented by a visual land-use survey. Unlike noise, human response to vibration is not dependent on existing vibration levels. Humans respond to a new source of vibration based on the frequency of the events. Therefore, rather than measuring existing vibration levels, the vibration measurements for the project focused on characterizing the vibration propagation through the ground at representative locations. Eight sites, designated as V-1 through V-8, were selected during the Draft EIS process to represent a range of soil conditions in areas along the East Link Project corridor near sensitive land uses. An additional six measurement locations, designated as V-9 through V-14, were selected during the Final EIS process to refine the projections at locations where impacts would occur, as identified during the Draft EIS; several of these were conducted at specific buildings to measure the response of the foundation to vibration. Measurements were conducted at selected sites in Seattle, Bellevue, and Redmond. The locations of these measurement sites are indicated in Exhibits 3-1 through 3-5, along with the noise monitoring locations, and are described below; site photographs are included in Appendix B of this report:

- **Site V-1:** This site was located at the corner of 32nd Avenue and South Day Street in Seattle, above the I-90 tunnel. The vibration measurements at this site are representative of Segment A.
- **Site V-2:** This site was located in the parking lot of the South Bellevue Park-and-Ride Lot. The vibration measurements at this site are representative of the southern portions of Segment B.
- **Site V-3:** This site was located in the parking lot of the King County District Court in Surrey Downs Park. The vibration measurements at this site are representative of the northern portion of Segment B and the at-grade and elevated alternatives in Segment C, except for Overlake Hospital.
- **Site V-4a and V-4b:** This site was located in the median of NE 12th Street, between 108th Avenue NE and 110th Avenue NE. The vibration measurements at this site, taken at two different depths (V-4a and V-4b), are representative of the tunnel alternatives in Segment C.
- **Site V-5:** This site was located in the parking lot of Overlake Hospital, adjacent to NE 12th Street. The vibration measurements at this site represent Overlake Hospital and were used to assess the vibration-sensitive equipment, including the mobile MRI and the optical surgery unit within this facility.
- **Site V-6:** This site was located in Highland Park off Bel-Red Road in Bellevue. The vibration measurements at this site are representative of Segment D.
- **Site V-7:** This site was located at the corner of 154th Avenue NE and NE 54th Street in Redmond, in a residential neighborhood. The vibration measurements at this site are representative of the southern portion of Segment E, along SR 520.
- **Site V-8:** This site was located at the Redmond Town Center, along Bear Creek Trail to the south of the commercial buildings. The vibration measurements at this site are representative of the areas along the northern portion of Segment E, near the Redmond Town Center.
- **Site V-9:** This site was located at the Winters House in Bellevue, and the vibration measurements at this site were used to assess vibration and groundborne noise impact at the Winters House.
- **Site V-10:** This site was located on SE 3rd Street in a residential neighborhood. The vibration measurements at this site are representative of the residential area just to the south of Downtown Bellevue.
- **Site V-11:** This site was located at the Bellevue Hilton, and the vibration measurements at this site were used to assess impacts at the Hilton Hotel.
- **Site V-12:** This site was located at the Meydenbauer Center Theater in Bellevue, and the vibration measurements at this site were used to assess the vibration and groundborne noise levels in the theater at the Meydenbauer Center.

- **Site V-13:** This site was located at NE 12th Street in Bellevue, and the vibration measurements at this site are representative of the sensitive receptors in Downtown Bellevue associated with the at-grade and elevated alternatives.
- **Site V-14:** This site was located at 152nd Avenue NE in Redmond and the vibration measurements at this site were used to supplement the measurement Site V-6 for Segment D.

3.3.2 Instrumentation and Procedures

Vibration propagation is characterized by the relationship between an input force and the resulting ground-surface vibration, called the transfer mobility. Transfer mobility measurements are made by producing an impulsive force and measuring the vibration response at accelerometers located at a range of distances. With the transfer mobility, it is possible to estimate the ground vibration that would be caused by sources, such as a train, by substituting the impact force with the train forces. The vibration propagation test system for surface alternatives is shown schematically in Exhibit 3-6, and Exhibit 3-7 shows the test system for tunnel alternatives. As shown in the cross-section view at the top of Exhibit 3-6, the surface test consists of dropping a 60-pound weight from a height of 3 to 4 feet onto the ground to generate a force. For tunnel testing, a drill rig is used to generate the force at the required tunnel depth.

The measurement equipment includes a load cell to measure the forces produced by the weight, high-sensitivity accelerometers, amplifiers, and an eight-channel digital audio tape (DAT) recorder. The accelerometers are located on either paved surfaces or on top of steel stakes driven into soil and mounted with a clay compound in the vertical orientation. During the measurements, personnel continually monitor the recording levels and listen to the acceleration signals to make sure that acceptable data are collected. The sketch in the lower half of Exhibit 3-6 shows how the dropped weight point source was used to simulate a line vibration source such as a train. Impact tests were made at regular intervals in a line along the rail alternative. For these tests, impacts were done at 11 points spaced 15 feet apart. Six accelerometers were placed perpendicular to the impact locations at distances between 25 and 150 feet away. For each impact location, approximately 25 impacts were produced in order to obtain a statistically accurate sample.

3.4 Vibration Propagation Results

Data recorded in the field were analyzed in the laboratory using digital signal processing software that calculates the point-source transfer mobility and coherence between each impact and accelerometer location. Coherence is a measure of how accurate the transfer mobility is calculated; following are the basic analysis steps:

- Each impulse signal from the load cell and response signals from the accelerometers was identified in the recordings.
- Narrowband transfer functions and coherences were computed from an average of all the impulses at a specific impact location.
- The narrowband transfer functions and coherences were summed into 1/3-octave band levels.
- A linear or quadratic regression was calculated for all of the point-source transfer mobilities in each 1/3 octave band. These transfer mobility regressions were used to compute smooth point-source transfer mobility versus distance relationship.
- Each of the 1/3-octave band point-source transfer mobility relationships were then integrated into an equivalent line-source transfer mobility using Simpson's rule for numerical integration. The end result was an estimate of line source transfer mobility based on the distance from the source of the vibration.

Examples of the resulting smoothed line source transfer mobilities are provided in Exhibits 3-8 through 3-10E, which provide the spectra at a distance of 100 feet for each test site. More details on the propagation test and analysis procedures are given in the FTA guidance manual *Transit Noise and Vibration Impact Assessment*. Detailed vibration propagation data for the project are included in Appendix C of this report.

4.0 Noise and Vibration Impact Criteria

The operation of a light rail system can cause noise and vibration that can be a major public concern. Noise impacts can be caused by either transit operations or changes in traffic resulting from a roadway being widened or realigned for the project, and different criteria exist for each source of noise. In addition, groundborne noise caused by vibration has different impact criteria. This section summarizes what defines a noise and vibration impact, as applicable to the East Link Project.

4.1 Transit Noise Criteria

Noise impacts for this project are determined based on the criteria defined in the FTA guidance manual *Transit Noise and Vibration Impact Assessment* (FTA, 2006). The FTA noise impact criteria are based on well-documented research on community reaction to noise and on change in noise exposure rated using a sliding scale. Although more transit noise is allowed in neighborhoods with high levels of existing noise, as existing noise levels increase, smaller increases in total noise exposure are allowed than in areas with lower existing noise levels. The FTA Noise Impact Criteria group noise-sensitive land uses into the following three categories:

- **Category 1**: Buildings or parks where quiet is an essential element of their purpose.
- **Category 2**: Residences and buildings where people normally sleep. This includes residences, hospitals, and hotels where nighttime sensitivity is assumed to be of utmost importance.
- **Category 3**: Institutional land uses with primarily daytime and evening use. This category includes schools, libraries, churches, and active parks.

Ldn is used to characterize noise exposure for residential areas (Category 2). For other noise-sensitive land uses, such as outdoor amphitheaters and school buildings (Categories 1 and 3), the maximum 1-hour Leq during the facility's operating period is used.

There are two levels of impact included in the FTA criteria, severe and moderate, interpreted as follows:

- **Severe Impact:** Project-generated noise in the severe impact range can be expected to cause a large percentage of people to be highly annoyed by the new noise and represents the most compelling need for mitigation. Noise mitigation will normally be specified for severe impact areas unless there are truly extenuating circumstances that prevent it.
- **Moderate Impact:** In this range of noise impact, the change in the cumulative noise level is noticeable to most people but may not be sufficient to cause strong, adverse reactions from the community. In this transitional area, other project-specific factors must be considered to determine the magnitude of the impact and the need for mitigation. These factors include the existing level, the projected level of increase over existing noise levels, the types and numbers of noise-sensitive land uses affected, the noise sensitivity of the properties, the effectiveness of the mitigation measures, community views, and the cost of mitigating noise to more acceptable levels.

The FTA noise impact criteria are summarized in graphical form in Exhibit 4-1, which shows the existing noise exposure and the additional noise exposure from the transit project that would cause either moderate or severe impact. The future noise exposure would be the combination of the existing noise exposure and the additional noise exposure caused by the transit project. Exhibit 4-2 expresses the same criteria in terms of the increase in total or cumulative noise that can occur in the overall noise environment before an impact occurs.

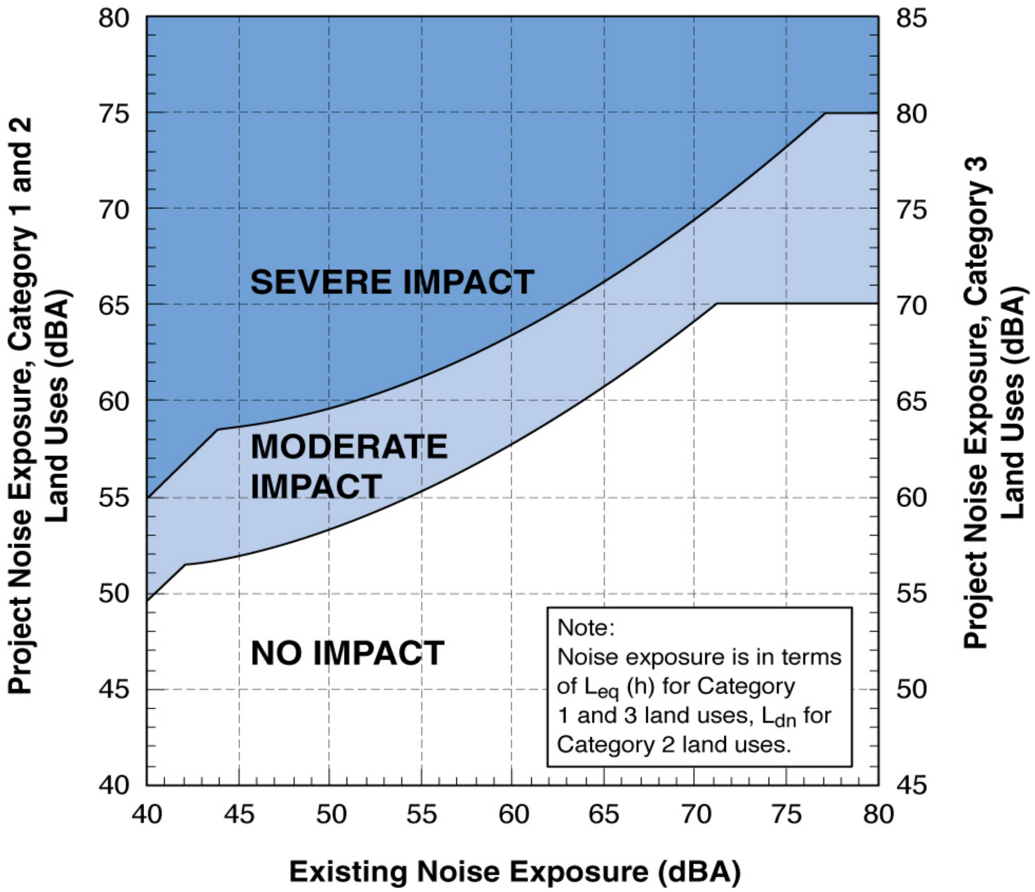

EXHIBIT 4-1
FTA Project Noise Impact Criteria
Note: Leq(h) = hourly Leq

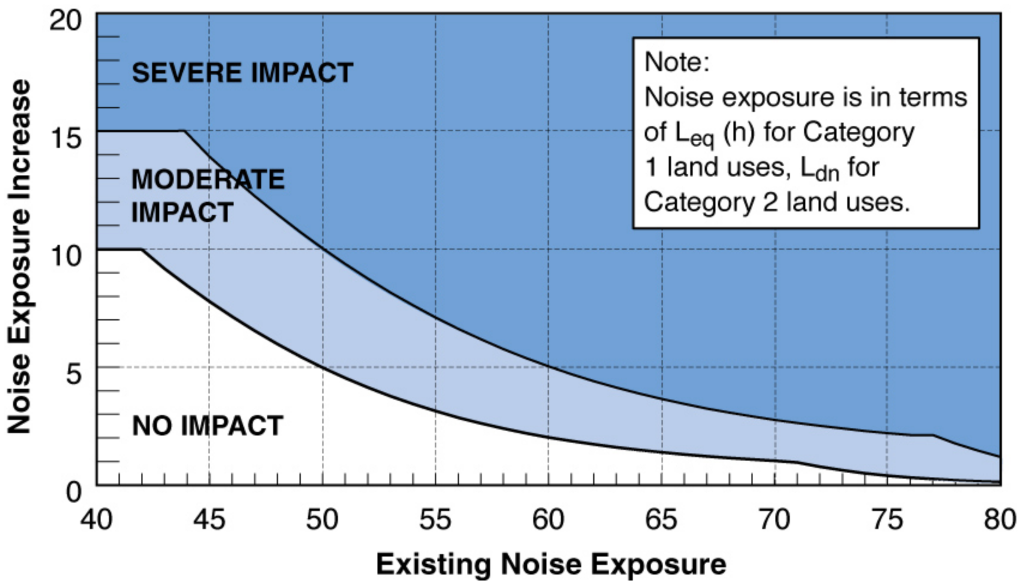

EXHIBIT 4-2
Increase in Cumulative Noise Exposure Allowed by FTA Criteria
Note: Leq(h) = hourly Leq

The FTA Manual provides guidance on how parks are analyzed for noise in Chapter 3, Section 2, Application of Noise Impact Criteria. The FTA assumes that parks are a special case, and how they are used and where they are located should be considered when considering whether or not that particular park, or an area in that park, is considered noise-sensitive. In general, most parks used for outdoor recreation are not considered noise-sensitive. This includes parks with baseball diamonds, soccer fields, basketball courts, football fields, and other active recreation areas.

Parks that are noise-sensitive would be those where quiet is an essential element in their intended purpose or places where it is important to avoid interference with activities such as talking, meditation, and concentration on reading material. The existing noise levels at a park can provide some indication of the sensitivity of its use. All parks along the project corridor were evaluated for noise, and the results are provided in Section 6.1 in Chapter 6, Noise and Vibration Impact Assessment.

4.2 Traffic Noise Criteria

Consistent with the FTA Manual, FHWA methodology and criteria are used to evaluate traffic noise impacts. The criteria for highway noise impacts are taken from the FHWA Procedures for Abatement of Highway Traffic Noise and Construction Noise, United States Code of Federal Regulations (CFR) 23 772, 1982. Table 4-1 lists the traffic noise abatement criteria. A noise impact occurs if projected noise levels approach the levels listed in Table 4-1 or substantially exceed existing noise levels. Each state defines their own quantitative levels considered to approach or substantially exceed existing noise levels. Projects that include construction of new highways, reconstruction of existing highways that includes significantly changing either the horizontal or vertical profile, or an increase in the number of through traffic lanes require analysis and consideration of abatement. A significant change in the horizontal or vertical profile occurs when the change is likely to result in increased noise levels to developed lands.

TABLE 4-1
FHWA Traffic Noise Abatement Criteria

Land Use Category		Hourly Leq (dBA)
Type A	Lands on which serenity and quiet are of extraordinary significance and which serve an important public need and where the preservation of those qualities is essential if the area is to continue to serve its intended purpose	57 (exterior)
Type B	Picnic areas, recreation areas, playgrounds, active sports areas, parks, residences, motels, hotels, schools, churches, libraries, and hospitals	67 (exterior)
Type C	Developed lands, properties, or activities not included in the above categories	72 (exterior)
Type D	Undeveloped land	—
Type E	Residences, motels, hotels, public meeting rooms, schools, churches, libraries, hospitals, and auditoriums	52 (interior)

The Washington State Department of Transportation (WSDOT) is responsible for implementing the FHWA regulations in Washington. Under WSDOT policy, a traffic noise impact occurs if projected noise levels are within 1 dB of the FHWA criteria; therefore, a residential impact occurs at 66 dBA Leq and a commercial impact occurs at 71 dBA Leq. WSDOT also considers a 10-dB increase in noise a substantial increase impact, regardless of the existing noise level. Potential noise from park-and-ride lots were assessed using the local noise criteria, which is discussed later in Section 4.4.1 for construction noise.

4.3 Transit Vibration and Groundborne Noise Criteria

The FTA groundborne vibration impact criteria are based on land use and train frequency. The criteria for most land uses are shown in Table 4-2. The FTA vibration criteria are applied primarily to residential (including hotels and other places where people sleep) and institutional land uses. Commercial land uses are only considered when they contain vibration-sensitive uses, such as medical offices or sensitive manufacturing equipment. The criterion applied to these locations is dependent on the sensitivity of the use. Some buildings, such as concert halls, recording studios, and theaters, can be particularly sensitive to vibration but do not fit into any of the three categories listed in Table 4-2. Due to their sensitivity, these buildings usually warrant special attention during the impact assessment. Table 4-3 gives criteria for acceptable levels of groundborne vibration for various types of special buildings.

Table 4-4 provides vibration criteria for detailed vibration analyses at highly sensitive locations . The criteria in Table 4-4 are based on exceedances of the 1/3-octave-band vibration levels over the frequency range 8 to 80 Hertz (Hz). In addition, these detailed criteria would be used to assess vibration impact at highly sensitive locations, such as the Overlake Hospital, the Group Health Hospital, and the new Children's Hospital BCSC because of potentially sensitive medical equipment and procedures. These criteria are also shown graphically in Exhibit 4-3.

It should also be noted that Tables 4-2 and 4-3 include separate FTA criteria for groundborne noise, the "rumble" that can be radiated from the motion of room surfaces in buildings due to groundborne vibration. The vibration of floors and walls causes them to act like loudspeakers, generating noise due to the movement of the surfaces. Although expressed in dBA, which emphasizes the more audible middle and high frequencies, the criteria are set considerably lower than for airborne noise to account for the annoying low-frequency character of groundborne noise. Because airborne noise often masks groundborne noise for aboveground (i.e., at-grade or elevated) transit systems, groundborne noise criteria are primarily applied to subway operations where airborne noise is not a factor. For above-grade transit systems, groundborne noise criteria are applied only to buildings that have sensitive interior spaces that are well insulated from exterior noise.

TABLE 4-2
Groundborne Vibration and Noise Impact Criteria

	Groundborne Vibration Impact Levels (VdB re 1 microinch/second)			**Groundborne Noise Impact Levels (dB re 20 micro-Pascals)**		
Land Use Category	**Frequent Events**[a]	**Occasional Events**[b]	**Infrequent Events**[c]	**Frequent Events**[a]	**Occasional Events**[b]	**Infrequent Events**[c]
Category 1: Buildings where low ambient vibration is essential for interior operations	65 VdB[d]	65 VdB[d]	65 VdB[d]	N/A[e]	N/A[e]	N/A[e]
Category 2: Residences and buildings where people normally sleep	72 VdB	75 VdB	80 VdB	35 dBA	38 dBA	43 dBA
Category 3: Institutional land uses with primarily daytime use	75 VdB	78 VdB	83 VdB	40 dBA	43 dBA	48 dBA

[a] "Frequent Events" are defined as more than 70 vibration events of the same source per day; most rapid transit projects fall into this category.

[b] "Occasional Events" are defined as between 30 and 70 vibration events of the same source per day; most commuter trunk lines have this many operations.

[c] "Infrequent Events" are defined as fewer than 30 vibration events of the same kind per day; this category includes most commuter rail branch lines.

[d] This criterion limit is based on levels that are acceptable for most moderately sensitive equipment, such as optical microscopes. Vibration-sensitive manufacturing or research requires detailed evaluation to define the acceptable vibration levels. Ensuring lower vibration levels in a building often requires special design of the heating, ventilation, and air conditioning (HVAC) systems and stiffened floors.

[e] Not applicable. Vibration-sensitive equipment is generally not sensitive to groundborne noise.

TABLE 4-3
Groundborne Vibration and Noise Impact Criteria for Special Buildings

Type of Building or Room[a]	Groundborne Vibration Impact Levels (VdB re 1 micro-inch/sec)		Groundborne Noise Impact Levels (dB re 20 micro Pascals)	
	Frequent Events[b]	Occasional or Infrequent Events[c]	Frequent Events[b]	Occasional or Infrequent Events[c]
Concert Halls	65 VdB	65 VdB	25 dBA	25 dBA
TV Studios	65 VdB	65 VdB	25 dBA	25 dBA
Recording Studios	65 VdB	65 VdB	25 dBA	25 dBA
Auditoriums	72 VdB	80 VdB	30 dBA	38 dBA
Theaters	72 VdB	80 VdB	35 dBA	43 dBA

[a] If the building will rarely be occupied when trains are operating, then there is no need to consider impact. As an example, consider locating a commuter rail line next to a concert hall: if no commuter trains will operate after 7 p.m., then trains should rarely interfere with the use of the hall.

[b] "Frequent Events" are defined as more than 70 vibration events per day; most transit projects fall into this category.

[c] "Occasional or Infrequent Events" are defined as fewer than 70 vibration events per day; this category includes most commuter rail systems.

TABLE 4-4
Vibration Criteria for Detailed Analysis at Highly Sensitive Locations

Criterion Curve	Maximum Lv (VdB)[a]	Description of Use
Workshop	90	Distinctly detectable vibration; appropriate to workshops and nonsensitive areas
Office	84	Detectable vibration; appropriate to offices and nonsensitive areas
Residential day	78	Barely detectable vibration; adequate for computer equipment and low-power optical microscopes (up to 20X)
Residential night, operating rooms/ sensitive hospital equipment	72	Vibration not detectable, but groundborne noise might be audible inside quiet rooms; suitable for medium-power optical microscopes (100X) and other equipment of low sensitivity
VC-A	66	Adequate for medium- to high-power optical microscopes (400X), microbalances, optical balances, and similar specialized equipment
VC-B	60	Adequate for high-power optical microscopes (1,000X) and inspection and lithography equipment up to 3 micron-line widths
VC-C	54	Appropriate for most lithography and inspection equipment to 1 micron detail size
VC-D	48	Suitable in most instances for the most demanding equipment, including electron microscopes operating to the limits of their capability
VC-E	42	The most demanding criterion for extremely vibration-sensitive equipment

[a] As measured in one-third-octave bands of frequency over the frequency range 8 to 80 Hz.

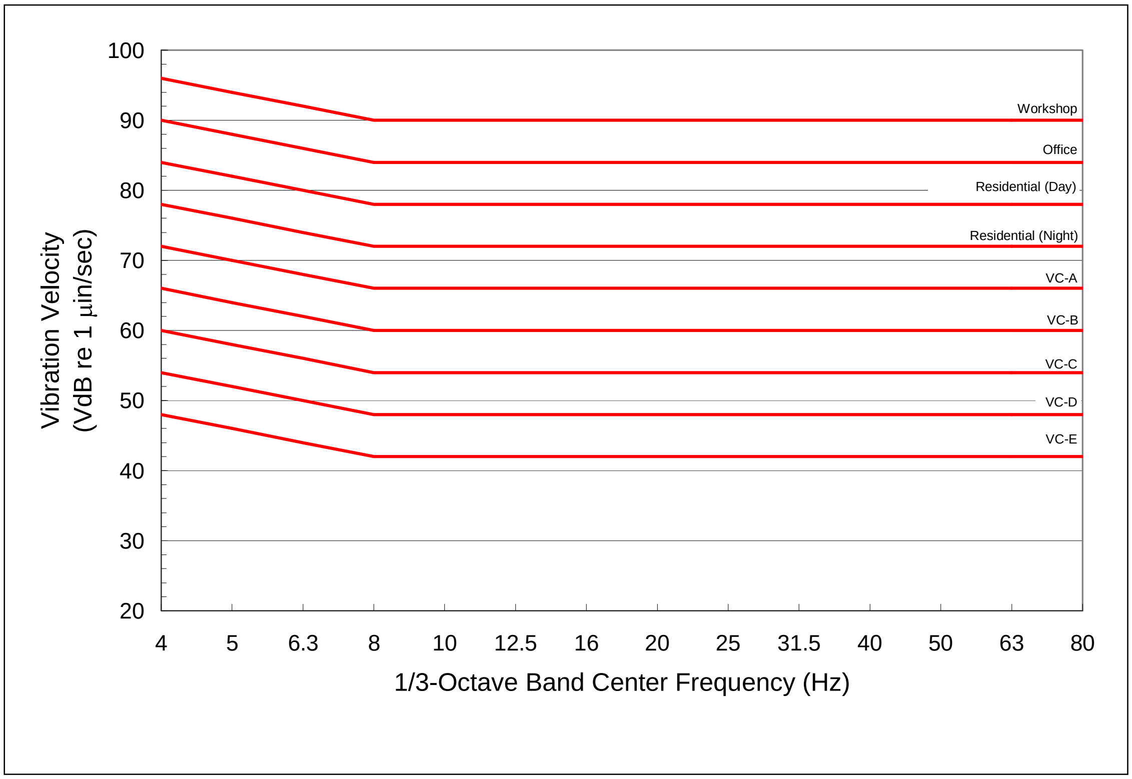

EXHIBIT 4-3
Vibration Criteria for Highly Sensitive Locations

4.4 State and Local Noise Ordinances

Project operation and construction would take place in four cities within King County, so several different noise ordinances might be applicable to the operation of ancillary facilities and project construction. Most cities in Washington, including all those in the project corridor, rely, at least in part, on the Washington State Administrative Code (WAC), Chapter 173-60, Maximum Environmental Noise Levels, for residential, commercial, and industrial noise limits, along with construction noise limits. The City of Seattle has a set of specific construction criteria that would be followed for all construction work in Segment A. Construction work in other segments would follow the WAC noise control ordinance. However, local noise ordinances can include different provisions from the State law. For example, the City of Bellevue applies its exemption for construction noise more stringently, with fewer evening and weekend hours considered exempt.

4.4.1 Washington State Noise Regulation

The Washington State Noise Control Ordinance (together with local noise regulations) applies to general construction activities, park-and-ride lots, and maintenance facilities. The WAC does not contain a section specific to highway or light rail noise. State law exempts mobile noise sources, including freight rail, aircraft in flight, and vehicles traveling in public right-of-way, as well as safety warning devices (i.e., bells). For stationary land uses with noises originating from outside public roadways and rights-of-way, the Washington State Noise Control Ordinance defines three classes of property usage, called Environmental Designation for Noise Abatement (EDNA), and maximum allowable noise levels for each, as shown in Table 4-5. For example, the noise caused by a commercial property must be less than 57 dBA at the closest residential property line. From 10 p.m. to 7 a.m., the maximum allowable levels shown in Table 4-5 are reduced by 10 dBA. Besides the property line noise standards in Table 4-5, there are exemptions in the WAC for short-term noise exceedances, including those outlined in Table 4-6 that are based on the minutes per hour that the noise limit is exceeded. The allowable exceedances presented in Table 4-6 are commonly measured using the statistical distribution measurement metrics, with the L25 equal to the 15-minute exceedance, the L8.3 for the 5-minute exceedance, and the L2.5 for the 1.5-minute exceedance.

TABLE 4-5
Washington State Noise Control Regulation (WAC 173-60)

Land Use	Maximum Allowable Sound Level (dBA)[a]		
	Residential	Commercial	Industrial
Residential	55	57	60
Commercial	57	60	65
Industrial	60	65	70

[a] Between 10 p.m. and 7 a.m. the levels given above are reduced by 10 dBA.
WAC Washington Administrative Code

TABLE 4-6
WAC 173-60 Exemptions for Short-Term Noise Exceedance

Minutes Per Hour	Adjustment to Maximum Sound Level
15	+5 dBA
5	+10 dBA
1.5	+15 dBA

WAC Washington Administrative Code

4.4.2 WAC Construction Noise Criteria

For the purpose of discussing construction noise and potential construction noise impacts, this study used the WAC. Most project construction can be performed within the limits of the WAC noise ordinance if the work is conducted during normal daytime hours. If construction is performed during the nighttime, the contractor must still meet the WAC noise-level requirements presented in Table 4-5 or get a noise variance from the governing jurisdiction. The construction contracts would contain sections specific to construction noise and address any site-specific requests for variances or other construction-related noise issues associated with the East Link Project.

The State of Washington has also developed a set of construction-specific allowable noise-level limits that would apply to the construction of the East Link Project. These construction noise regulations are organized by type of noise and include general construction equipment; impulse equipment, such as jackhammers and pile-drivers; haul trucks; and safety alarms, such as back-up beepers.

4.4.3 Haul Truck Noise Criteria

Maximum permissible sound levels for haul trucks on public roadways are limited to 86 dBA for speeds of 35 miles per hour (mph) or less, and 90 dBA for speeds over 35 mph when measured at 50 feet (Chapter 173-62, WAC). For trucks operating at staging areas, the general construction equipment would be used to determine compliance.

4.4.4 Noise Related to Back-Up Alarms

Sounds created by backup alarms are exempt, except between 10 p.m. and 7 a.m. when "beep-beep" backup alarms are essentially prohibited by the WAC in urban areas and would be replaced with smart back-up alarms, which automatically adjust the alarm level based on the background level or switch off back-up alarms and replace with spotters. This criterion is included because, just like noise from construction activities, noise from back-up beepers would exceed the WAC nighttime criteria, even with the allowable exceedance, at distances up to 800 feet, or more, from the construction site.

4.5 Construction Vibration Criteria

Construction vibration, unlike vibration from operations, has the potential to cause damage to structures at very close distances, from activities such as blasting and pile-driving. Because of this, the construction vibration discussion includes both annoyance impact criteria and damage criteria.

Generally, because of the short duration of construction vibration activities, annoyance is usually not an issue. For longer-term activities, such as tunneling and associated muck train use (a muck train removes excavated material from a tunnel during construction), annoyance impact would be addressed. When vibration and associated groundborne noise are assessed for particular construction activities, the transit vibration impact criteria are used to determine the potential for impact. Because the transit vibration criteria are based on the frequency of events, it is important to know the frequency of events for a particular construction activity.

In order to assess the potential for damage from construction activities, criteria in terms of PPV (as discussed in Section 2.2) have been developed based on the building type (Swiss Consultants for Road Construction Association, 1992). These criteria include the following (vibration velocity levels are noted in parentheses):

- Reinforced concrete, steel, or timber: 0.5 PPV (102 VdB)
- Engineered concrete and masonry: 0.3 PPV (98 VdB)
- Nonengineered timber and masonry buildings: 0.2 PPV (94 VdB)
- Buildings extremely susceptible to vibration damage: 0.12 VdB (90 VdB)

As can be seen from the corresponding vibration velocity levels in parentheses, the thresholds for damage for even the most sensitive buildings are 1 to 2 orders of magnitude higher than the criteria for annoyance from vibration.

5.0 Future Build Conditions

This section summarizes the models used to predict future noise and vibration levels for potential sources of community impact related to the East Link Project. These sources include light rail operation, changes in traffic due to the project, and construction activities.

5.1 Light Rail Noise Projections

Noise from light rail operations was modeled using the methods described in the FTA *Transit Noise and Vibration Assessment Manual*. Input to the model included the following:

- Three-car trains with 7-minute headways during peak hours, 10-minute headways during midday and early evening, and 15-minute headways during late evening, nighttime, and early morning hours. (See Appendix E of the Final EIS for a summary of the Operations Plan.)
- Measured reference noise levels for the new light rail vehicles that are being used on the Central Link system, which have wheel skirts. The reference measurements were taken along the ballast and tie segment of the initial segment in south Seattle in March 2010. Curves of modeled Ldn and maximum noise level (Lmax) versus distance assuming a train speed of 50 mph are shown in Exhibit 5-1. (The noise projections in Exhibit 5-1 are corrected to account for speed, track type, and topographical conditions.)
- Digital terrain in 5-foot-elevation contour intervals.
- Plan and profile of the proposed light rail alternatives and design options, including the locations of special trackwork, such as crossovers, where wheel impacts make a clicking noise and vibration levels can be increased. For this analysis, measured increases in the light rail pass-by at crossovers were taken from the embedded crossovers along Martin Luther King Jr. Way South in Seattle. The measured data used for the crossovers were taken before noise-reducing modifications were recently added to these crossovers.
- Proposed maximum speeds along each of alternatives/design options.
- Adjustments based on track type, as shown in Table 5-1.
- Train-mounted bells were measured and validated in October 2009, with several supplemental measurements over the last two years. Under the current Sound Transit bell policy, train-mounted bells would be sounded two to three times as a train approaches and passes through an at-grade crossing, producing maximum levels of 80 dBA Lmax at 50 feet between 6:00 a.m. and 10:00 p.m. and reducing to 72 dBA Lmax between 10:00 p.m. and 6:00 a.m.
- For gated at-grade crossings, the project proposes to use electrical bells that are adjustable, with typical noise levels ranging from approximately 75 dBA to 85 dBA Lmax at 10 feet. For this analysis, the gate bells were analyzed using the default methods from the FTA Manual (2006), which assumes a typical Lmax of 85 to 86 dBA at 10 feet (or a single event level [SEL] of 109 dBA at 50 feet) and a 360 degree directional sound output. The bells would sound for approximately 25 seconds per train (10 to 13 seconds each, while lowering and raising the gates). Although it is plausible to lower the bell noise levels to 75 dBA, the default setting are being used to ensure a conservative analysis. Other noise mitigation alternatives, such as directional shrouds and turning off the bells while the gates are raised, were also not considered in this analysis.
- Sound Transit is currently investigating the use of nonaudible warnings for gated and ungated at-grade crossings. If nonaudible warning devices are found to be viable, this option could be used to reduce or eliminate bell noise at specific crossings, and could also reduce the number or severity of noise impacts presented in this study.
- Wheel squeal was assumed on all curves with a radius of less than 600 feet based on experience with the Central Link system. Wheel squeal is not included in the model because Sound Transit has committed to lubricating all curves in noise-sensitive areas with a radius of less than 600 feet, and preparing all curves with radius of less than 1,000 feet for lubrication.

The procedure used to evaluate the impacts of the project alternatives is based on the change in noise levels that would be caused by each alternative and the number of dwelling units potentially affected by project noise. For this analysis, attenuation for the noise reducing effects of ground coverage was not included, and all front-line receivers were assumed to have a line-of-sight view of the light rail route unless the route was in a retained cut, directly shielding the receptor from the tracks. This conservative methodology ensures that all potential noise impacts will be identified. This method is consistent with the FTA *Transit Noise and Vibration Manual*. Based on the results of the analysis provided in this section, noise impacts were determined for each alternative and for ancillary facilities. These impacts are identified in Section 6. Noise mitigation options were evaluated for all locations where the projected levels of noise exposure would exceed the FTA noise impact thresholds. The noise mitigation measures for the alternatives are discussed in Section 7.

TABLE 5-1
Light Rail Track-Type Adjustments

Track Type	Adjustment in dB
At-grade ballast and tie-track (ballast exposed)	0
Elevated structure	+4

Retained cut	-6
Crossover	+10

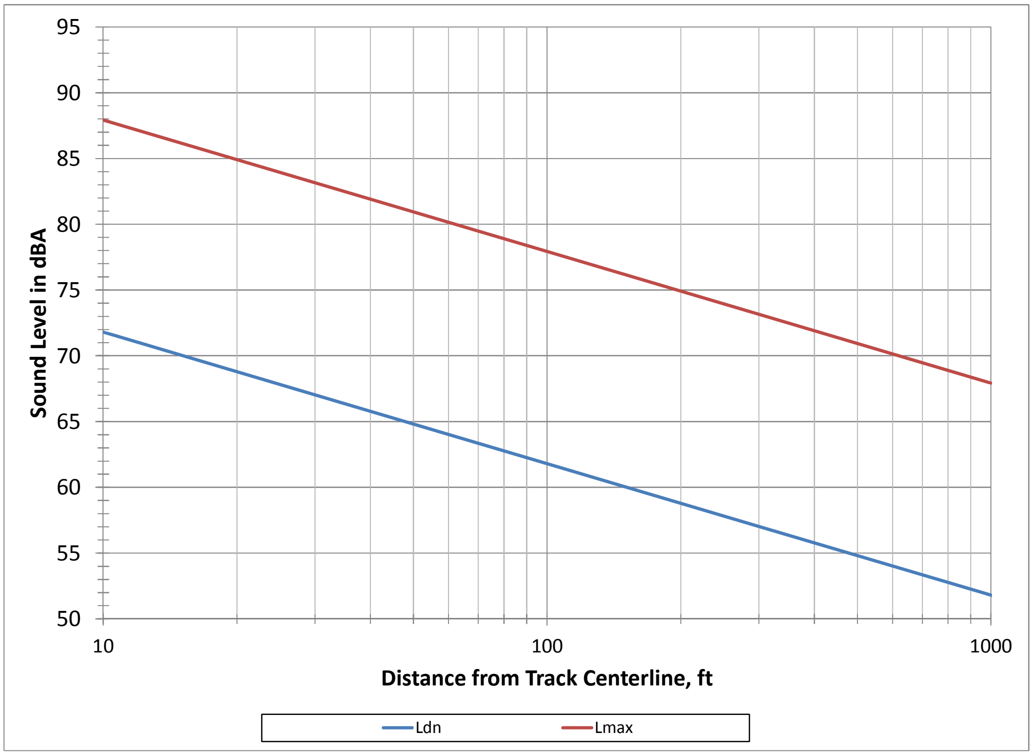

EXHIBIT 5-1
Projected Noise Levels from Light Rail Operations, 50 mph

5.2 Light Rail Vibration Projections

The projection of groundborne vibration from East Link Project light rail operations was based on the following:

- Vibration source levels were based on measurement data for the Sound Transit light rail vehicle, as measured by Wilson Ihrig & Associates, Inc. (2007).
- Vibration propagation tests were conducted at representative sites along the corridor near sensitive receptors (described in Section 3.3). The test results were combined with the vehicle vibration source level measurement data to project vibration levels from vehicles operating on the East Link Project alternatives.
- Vehicle operating speeds were taken from the operations plans. The speeds are dependent on location, with a maximum operating speed of 55 mph.
- Wheel impacts at crossovers typically cause localized vibration increases of 10 VdB.

The assumed vehicle vibration characteristics (represented by the force density spectra in Exhibit 5-2) at the appropriate speeds were combined with the ground-vibration propagation test results described in Section 3.3 and represented by transfer mobility spectra such as those shown in Exhibits 3-8 through 3-10E. Vibration levels were projected as a function of distance and speed for each of the test sites along the proposed corridor. The results of these transfer mobility tests are presented in Appendix D of this report. The results suggest dividing the rail corridor into ten regions for the purposes of vibration projection (excluding the site-specific vibration testing at the Winters House, Hilton Hotel, and Meydenbauer Center), defined based on the test sites as follows:

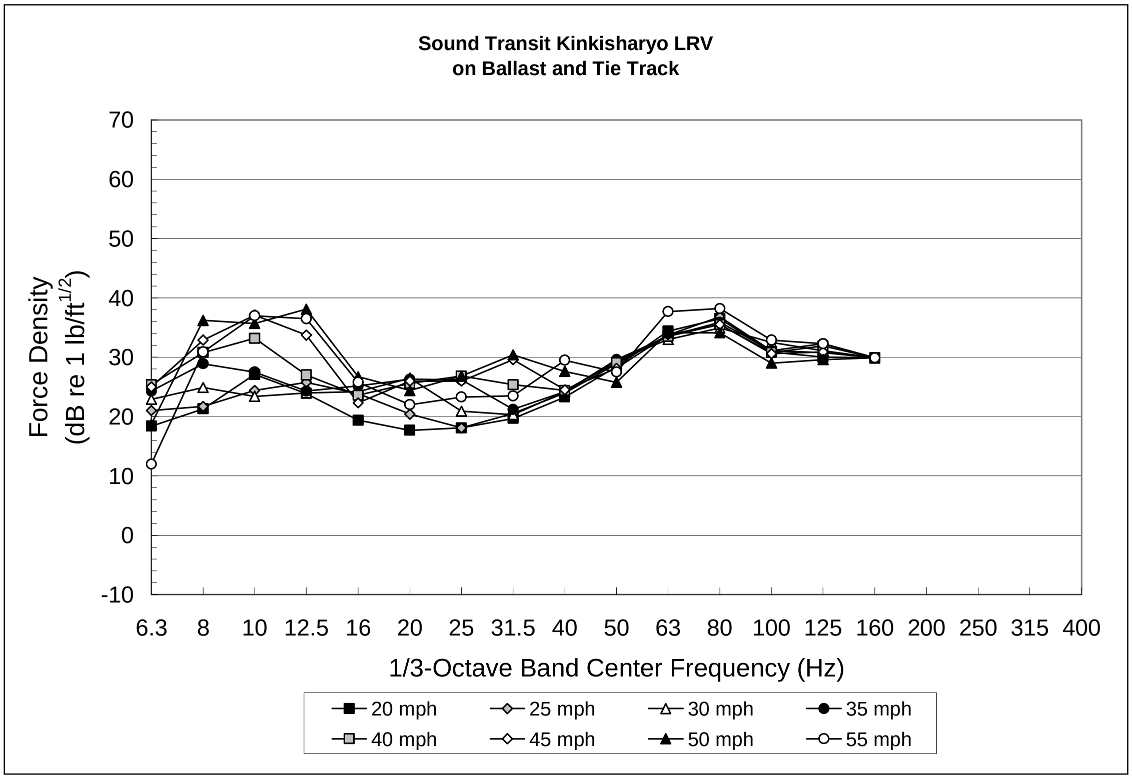

EXHIBIT 5-2
Light Rail Vehicle (LRV) Force Density Spectra on Ballast and Tie Track

- Region 1: Segment A (Site V-1)
- Region 2: The southern section of Segment B (Site V-2)
- Region 3: The northern section of Segment B and (Site V-3)
- Region 4: The southern section of Segment C (V-10)
- Region 5: The at-grade and elevated alternatives for Segment C (Site V-13)
- Region 6: The tunnel alternatives for Segment C (Site V-4)
- Region 7: Overlake Hospital (Site V-5)

- Region 8: Segment D (Sites V-6 and V-14)
- Region 9: The southern portion of Segment E (Site V-7)
- Region 10: The northern portion of Segment E (Site V-8)

The projections of maximum ground-vibration levels from light rail operations at 100 feet and 55 mph for each of the above ten regions are provided in Exhibits 5-3 through 5-5B. The curve for each site has a different spectral characteristic, which determines the distance to each region. The results suggest that there is relatively inefficient propagation of vibration throughout the proposed corridor, which will limit potential vibration impacts. However, there is substantial energy at higher frequencies (i.e., above 50 Hz), which suggests the potential for groundborne noise impacts in tunnel sections.

5.3 Construction Noise Projections

The construction noise analysis considers the temporary noise impacts that construction would cause in the project vicinity. These impacts would end when project construction is completed.

Noise and vibration related to construction would result from the operation of heavy equipment needed to construct various project components, including bridges, retaining walls, roads, park-and-ride lots, and stations. The contractor would be required to adhere to local ordinances regulating noise, discussed in Section 4.4. Construction outside normal weekday daytime hours might require a noise variance from the city or county where the work is being performed if regulatory noise levels are exceeded.

Equipment required to complete the project includes normal construction equipment typically used for transportation construction projects. Table 5-2 provides a list of the typical equipment used for this type of project, the activities they would be used for, and the corresponding Lmax that would be produced as measured at 50 feet, under normal use.

TABLE 5-2
Construction Equipment List, Reference Noise Levels

Equipment	Expected Project Use	Lmax[a, b] (dBA)
Air compressors	Pneumatic tools and general maintenance (all phases)	70 to76
Backhoe	General construction and yard work	78 to 82
Concrete pump	Pumping concrete	78 to 82
Concrete saws	Concrete removal and utilities access	75 to 80

TABLE 5-2 CONTINUED
Construction Equipment List, Reference Noise Levels

Equipment	Expected Project Use	Lmax[a, b] (dBA)
Crane	Materials handling: removal and replacement	78 to 84
Excavator	General construction and materials handling	82 to 88
Forklifts	Staging area work and hauling materials	72
Haul trucks	Materials handling: general hauling	86
Jackhammers	Pavement removal	74 to 82
Loader	General construction and materials handling	86
Pavers	Roadway paving	88
Pile-drivers	Support for structure and hillside	99 to 105
Power plants	General construction use: nighttime work	72
Pumps	General construction use: water removal	62
Pneumatic tools	Miscellaneous construction work	78 to 86
Tractor trailers	Material removal and delivery	86
Utility trucks	General project work	72
Vibratory equipment	Shoring up hillside to prevent slides and soil compacting	82 to 88
Welders	General project work	76

[a] Typical maximum noise level under normal operation as measured at 50 feet from the noise source.

[b] Noise levels presented are based on measured data from the Portland Light Rail and I-5 Preservation and Hawthorne Bridge construction projects and other measured data and USDOT construction noise documentation and other construction noise sources.

5.4 Construction Vibration Projections

Construction vibration, similar to noise, is highly dependent on the specific equipment and methods employed. Construction vibration can cause a variety of potential effects, including influence on vibration-sensitive equipment at lower levels, low rumbling or groundborne noise, vibrations perceptible to humans at moderate levels, and slight damage to buildings at the highest levels. Generally, construction vibration was assessed at locations where prolonged annoyance or building damage could be expected.

In most cases, the main concern for construction vibration is the potential for damage. However, most construction processes do not generate high enough vibration levels to approach damage criteria. Because construction is a short-term, temporary impact, annoyance is usually not an important issue. The only time annoyance is usually addressed for construction vibration is for longer-term impacts, such as those related to the tunneling in Segment C. However, the thresholds for annoyance from construction vibration are substantially lower than those for damage.

Damage from construction vibration is generally limited to pile-driving and vibratory rolling, the only two activities with PPV levels at 25 feet that are higher than the damage criteria discussed in Section 4.5, Construction Vibration Criteria. Because of this, care should be taken to limit these activities near structures as much as possible.

Tunnel construction in Segment C is most likely to have potential temporary, short-term vibration annoyance impacts. Some sections of the proposed tunnel alternatives are expected to be constructed using a tunnel-boring machine with muck trains to transport the excavated material. Other tunnel sections and stations would use cut-and-cover techniques with sheet piling or augered pile techniques at the stations and portals.

The methodology for assessing construction vibration annoyance impacts is consistent with the approach provided in the FTA guidance manual, which includes obtaining reference 1-second rms overall vibration levels and 1/3-octave band spectra for each source at a distance of 25 feet. The propagation of vibration as a function of distance is an important factor in predicting vibration levels. Generally, surface or bore-hole-based vibration propagation measurements at the specific sensitive sites are needed to provide a detailed assessment. The following general prediction model is used to calculate vibration levels at the sensitive locations in each 1/3-octave band using the following propagation adjustment:

$$Lv(\text{distance}) = Lv(25\text{ feet}) - 30*\log(\text{distance}/25\text{ feet})$$

Adjustment factors are then applied according to the geological conditions that could promote efficient vibration propagation, coupling to the building foundation, floor-to-floor attenuation, and the amplification of vibrations due to the resonances of floors, walls, and ceilings. Vibration levels at the sensitive locations are then assessed against the vibration criteria for detailed analysis at highly sensitive locations shown in Table 4-4.

In accordance with FTA guidance, groundborne noise is assessed by converting the 1/3-octave band vibration velocity levels into A-weighted noise levels. Assessment of groundborne noise levels only applies to human annoyance because research equipment and other receptors are rarely sensitive to noise. The projected A-weighted noise levels are then assessed against the groundborne noise impact criteria shown in Tables 4-2 and 4-3.

6.0 Noise and Vibration Impact Assessment

A detailed noise and vibration impact assessment was performed based on the criteria discussed in Section 4 and on the projections described in Section 5 of this report. The assessment results are described below.

6.1 Light Rail and Traffic Noise Impact Assessment

Evaluation of the environmental noise impacts of the East Link alternatives was based on the change in the environmental noise level due to each project alternative and the number of dwelling units potentially affected by project noise. The transit noise methodology is consistent with the FTA *Transit Noise and Vibration Manual*. The FTA noise assessment methodology was also applied to the park-and-ride facilities and transit centers.

Because of the magnitude of properties analyzed for noise impacts, this report only summarizes and presents the impacts. Appendix A provides detailed maps showing all parcels analyzed, noise impacts, and severity of impact along with mitigation measures. Appendix E includes complete tabulated data, including the project parcel identification, existing noise levels, project noise levels, criteria, and other information.

6.1.1 Transit Noise

East Link Project light rail operational noise impacts were determined using the following approach:

- Perform a land-use survey of potential noise-sensitive receptors near the project alternatives. This process involved site visits and review of area land-use maps. Receivers located near each other and at the same distance from the proposed light rail alternatives were grouped together in clusters. All of the receivers in a given cluster would be within the same distance of light rail tracks and under similar conditions (such as track type and train speed); they would therefore have the same noise exposure.
- Establish existing noise levels for the potentially affected area through long-term (24-hour) and short-term (20-minute periods) noise monitoring. Ambient noise monitoring data from previous studies were used along with supplemental data taken specifically for this project. The criteria for monitoring selection included land use, existing ambient noise, number of sensitive receivers in the area, and level of expected impact.
- Use the field-noise measurements to project ambient sound levels for the noise-sensitive receptors, based on similarities in noise-source characteristics.
- Use the existing ambient sound levels to determine the noise impact criteria at each cluster. The FTA criteria for noise impacts for a particular area are based on the existing noise level.
- Make projections of light rail noise levels based on track type, train speed, vehicle type, and distance of receiver from tracks, with adjustments for shielding and ground attenuation.
- Compare projections to affect thresholds to determine if the receiver or cluster would be impacted by light rail operations, and where noise impacts are identified, consider mitigation and review any mitigation with the FTA *Transit Noise and Vibration Manual* and the Sound Transit's 2004 *Noise Mitigation Policy*.

In addition to the light rail operational noise analysis, a general noise analysis was also performed for park-and-rides and maintenance bases. These facilities were analyzed following the FTA *Transit Noise and Vibration Manual* for fixed ancillary facilities, which include an analysis using the local noise control ordinance, as provided in the WAC, Chapter 173-60. In addition, all parks along the proposed alternatives were reviewed for noise sensitivity under the FTA *Transit Noise and Vibration Manual*.

The only parks that are considered noise-sensitive under the FTA regulations are the sections of Mercer Slough Nature Park and Marymoor Park where peace and quiet are an essential part of the park's purpose. In both of these parks, these areas of peace and quiet are over 350 feet from the project alternatives, highways, and major arterial roadways. In addition, the distance to these areas, along with existing shielding, are sufficient to reduce noise to below the existing environment in sensitive areas. All other parks and park areas along the alternatives are near major highway or arterial roadways, including I-90, SR520, Bellevue Way SE, 112th Avenue SE, NE 12th Street, and other major roadways, and therefore are not considered noise-sensitive under FTA criteria.

6.1.2 Traffic Noise

Traffic noise was analyzed using the WSDOT methods given in the *Traffic Noise Abatement Policy and Procedures* (WSDOT, 2006). Traffic noise was only evaluated where required by FTA and FHWA, where the following conditions apply:

- A new roadway is planned as part of the project
- The project results in a significant change in the horizontal or vertical profile of an existing roadway
- The number of through-traffic lanes increases

Existing and future year 2030 peak-hour traffic noise levels were calculated using FHWA Traffic Noise Model (TNM) Version 2.5. Input to this model included traffic-volume and speed information from roadway traffic counts and data generated by Sound Transit traffic engineers. Input to the model relating to the existing and future roadway alignments and profiles was taken from engineering drawings and aerial photographs prepared by Sound Transit for the East Link Project. Traffic-noise emission levels used in the model were nationwide averages for automobiles, medium trucks, and heavy trucks. The noise-reducing effects of adjacent residences, roadway depressions, and topography were included in the calculations where appropriate. Project-related traffic noise impacts were identified by evaluating the TNM 2.5 model output against the traffic noise impact criteria. Noise monitoring data were used to validate the model.

6.1.3 Segment A

Segment A begins in the existing Downtown Seattle transit tunnel, continues along the I-90 D2 Roadway, and remains in the existing I-90 corridor to the I-90 Mount Baker Tunnel portals. Noise levels from rail operations in Seattle were projected for the residential area along Sturgus Avenue South, residences north of South Massachusetts Street, and at residences and parklands near the Mount Baker Tunnel. Projected project-related noise levels ranged from 55 to 63 dBA Ldn at residences and 61 dBA Leq at Judkins Park and Playfield.

Installing light rail on the I-90 floating bridge would require expansion joints at each end of the floating bridge structure that could create noise. Based on current projections, noise levels at a single home on Lake Washington Boulevard, just south of the bridge, could meet the FTA criteria, with a projected level of 63 dBA Ldn, when worst-case additional noise from the expansion joint is added to the analysis.

There are no existing expansion joints that could be measured for noise like the one proposed. Sound Transit is currently constructing a sample expansion joint for testing purposes. At that time, additional noise testing will be performed to determine if this impact would actually occur and what mitigation measures would be best suited to reduce noise levels from the joints.

In addition to the expansion joints, there would also be double crossovers located at each end of the floating bridge to facilitate single-track operations in the case of an emergency or for track maintenance. These crossovers are located over 400 feet from the nearest residences, would also be partly shielded from the residences by the safety barriers along the sides of the structure, and are not predicted to cause noise impacts.

On Mercer Island, noise projections were performed for the residences located on the west end of Mercer Island, to the I-90 lid, and near the east end of the island. Future project-related noise levels would range from 55 dBA Ldn to 58 dBA Ldn at the nearest homes on the west end of the island. The parks on Mercer Island are all well above the grade of the light rail trackway and would not be affected by noise from transit operations. There are no projected changes in the noise levels at any residences on Mercer Island, and no light rail noise impacts were identified. Table 6-1 summarizes noise impacts in Segment A, and Appendix E provides the tables of the modeled light rail noise levels.

TABLE 6-1
Summary of Potential Noise Impacts for Segment A

Alternative	Moderate Light Rail Impacts	Severe Light Rail Impacts	Traffic Noise Impacts
Preferred Interstate 90 Alternative (A1)	1	0	0

6.1.4 Segment B

Table 6-2 summarizes noise impacts in Segment B, and then a detailed description of the impacts for each alternative follows. Transit noise impacts were identified under all of the Segment B alternatives; traffic noise impacts would only occur for 112th SE Bypass (B3), B3 - 114th Extension Design Option , 112th SE At-Grade (B2A), and Bellevue Way (B1) Alternatives because of changes in the travel lanes in relation to sensitive receptors. Before mitigation, the *Preferred 112th SE Modified Alternatives (B2M)* connecting to *Preferred Alternative C9T*, both with and without the C9T – East Main Station Design Option, would have the fewest impacts with 66 noise impacts. Maps showing the locations of the Segment B alternatives impacts are provided in Appendix A, and full tables of all modeled light rail and traffic noise levels are in Appendix E.

TABLE 6-2
Summary of Potential Noise Impacts for Segment B

Alternative	Moderate Light Rail Impacts	Severe Light Rail Impacts	Traffic Noise Impacts
Preferred 112th SE Modified Alternative (B2M) to C11A	79	0	0
Preferred 112th SE Modified Alternative (B2M) to C9T	66	0	0
Preferred 112th SE Modified Alternative (B2M) to C9T – East Main Station Design Option	64	2	0
Bellevue Way Alternative (B1) [a]	128	4	136
112th SE At-Grade Alternative (B2A) [b]	77	1	17
112th SE Elevated Alternative (B2E)	85	21	0
112th SE Bypass Alternative (B3) [c]	79	4	17
B3 - 114th Extension Design Option [c]	76	1	17
BNSF Alternative (B7)	108	68	0

[a] Under Alternative B1 all but nine of the traffic noise impacts would also have light rail noise impacts; conversely, there are only five light rail impacts that would not have traffic noise impacts. The total number of residences impacted (single- and multifamily) under this alternative would be 141; 5 would be impacted by light rail noise only, 9 would be impacted by traffic noise only, and 127 would be impacted by both traffic noise and light rail noise.

[b] Under Alternative B2A all but one of the traffic noise impacts would also have light rail noise impacts. The total number of residences impacted (single- and multifamily) under this alternative would be 79; 62 would be impacted by light rail noise only, 1 would be impacted by traffic noise only, and 16 would be impacted by both traffic noise and light rail noise.

[c] Under Alternatives B3 and B3 – 114th Extension Design Option all but one of the traffic noise impacts would also have light rail noise impacts. For B3, the total number of residences impacted (single- and multifamily) would be 84; 67 would be impacted by light rail noise only, 1 would be impacted by traffic noise only, and 16 would be impacted by both traffic noise and light rail noise. For B3 – 114th Extension Design Option, the total number of residences impacted (single- and multifamily) would be 78; 61 would be impacted by light rail noise only, 1 would be impacted by traffic noise only, and 16 would be impacted by both traffic noise and light rail noise.

All Segment B alternatives except Alternative B7 travel along the west side of Mercer Slough Nature Park. This park is bordered on two sides by two interstate highways—I-90 and I-405—and on a third side by the major arterial Bellevue Way SE, a park-and-ride, and a commercial office park, where "quiet" is not an essential element as outlined in the FTA criteria for park noise analysis. The active uses along the west perimeter include the boat launch, blueberry farm, and Winters House and are not considered noise-sensitive. The central portions of Mercer Slough Nature Park contain uses that do meet the criteria as noise-sensitive, such as nature watching and protected trails.

Sound Transit conducted a noise impact analysis for park users in noise-sensitive areas of the Mercer Slough Nature Park and also predicted noise levels for the areas of the park near Bellevue Way SE. Typical noise levels at the edge of the park, near Bellevue Way SE, are between 61 dBA and 67 dBA Leq. Noise levels in noise sensitive areas of the park, near the center, were measured at 58 dBA Leq during normal daytime hours. The FTA Category 3, which includes certain parks and recreational areas, was used to determine compliance with FTA noise impact criteria at the interior noise-sensitive parts of the park. Light rail noise levels from operation of *Preferred Alternatives B2M* to *C11A* or *B2M* to *C9T* are predicted to be lower than the existing noise levels in the interior noise-sensitive areas of the park, and are under the FTA noise impact criteria for a Category 3 land use.

The only other park in Segment B is the Enatai Beach Park, which is well-shielded from light rail noise by I-90, and therefore would have no project-related noise impacts.

6.1.4.1 Preferred 112th SE Modified Alternative (B2M)

Under *Preferred Alternative B2M*, the level of noise impacts would vary with the different connections. Under *Preferred Alternative B2M to C11A*, 79 moderate light rail noise impacts are predicted. Forty-one impacts would occur along the elevated segment from I-90 to the intersection with 112th Avenue SE, affecting single-family residences adjacent to SE 34th Street and Bellevue Way SE. North of the Bellevue Way SE/112th Avenue SE intersection, seven noise impacts are predicted at the single-family residences west of 112th Avenue SE, near SE 17th and SE 14th Streets. All noise impacts between I-90 and the retained cut at the Winters House would be related to the elevated guideway, a crossover near SE 30th Street, and, to a lesser extent, train bells at the station.

Under *Preferred Alternative B2M to C11A*, 19 moderate noise impacts were also identified at the Bellefield Residential Park Condominiums as well as 12 moderate impacts at single-family residences along 111th Avenue SE just south of Surrey Downs Park. Impacts in this area would be due to lower impact criteria as a result of lower ambient noise levels, gated crossings, and train wayside noise.

Under *Preferred Alternative B2M to C9T*, 66 moderate light rail noise impacts were identified. Noise impacts from I-90 to 112th Avenue SE would be the same as with *Preferred Alternative B2M to C11A*, with 41 moderate impacts along this portion of the alternative. There would also be six impacts on single-family residences west of 112th Avenue SE, near SE 17th and SE 14th Streets, and nine moderate noise impacts at the Bellefield Residential Park Condominiums. Finally, there would be 10 moderate impacts at single-family residences along 111th Avenue SE just south of Surrey Downs Park.

Noise impacts with *Preferred Alternative B2M to C9T* would occur for the same reasons as with *Preferred Alternative B2M to C11A*, although some impacts would occur in different locations and with different severity. There are no roadway modifications that would move traffic closer to any noise-sensitive properties; therefore, no traffic noise impacts were identified under either of the *Preferred Alternative B2M* connection options.

Under *Preferred Alternative B2M to C9T* with the C9T - East Main Station Design Option, the SE 8th Station would be relocated to the north in Segment C, and a crossover from Segment C would be relocated to the SE 8th Station site in Segment B, just north of SE 8th Street. This change would increase the noise levels at several homes along 111th Place SE by 1 to 4 dB over the default station location. In addition, two of the moderate noise impacts would now be considered severe under the FTA criteria. The overall results under *Preferred Alternative B2M to C9T* with the C9T - East Main Station Design Option are 64 moderate impacts and 2 severe impacts. Table 6-3 summarizes a comparison between the two *Preferred Alternative* connections and the connection to the C9T – East Main Station Design Option based on land use type.

TABLE 6-3
Noise Impact Comparison for Preferred Alternative B2M to Preferred Alternative C11A, C9T, and C9T – East Main Station Design Option

Land Use Type	***To Preferred Alternative C9T***		***To Preferred Alternative C11A***		***To Preferred Alternative C9T with East Main Station Design Option***	
	Moderate	**Severe**	**Moderate**	**Severe**	**Moderate**	**Severe**
Single-family	57	0	60	0	55	2
Multifamily	9	0	19	0	9	0
Hotel	0	0	0	0	0	0
Hospital	0	0	0	0	0	0
School	0	0	0	0	0	0
Recording/concert (FTA Category-1)	0	0	0	0	0	0
Parks and recreation (FTA Category-3)	0	0	0	0	0	0
Church	0	0	0	0	0	0
Sensitive medical facilities (nonsleeping)	0	0	0	0	0	0
Total Impact Before Mitigation	**66**	**0**	**79**	**0**	**64**	**2**

6.1.4.2 Bellevue Way Alternative (B1)

In Segment B, 260 residential units and 3 church buildings were evaluated for noise impacts; the analysis projected an overall total of 141 noise impacts under Alternative B1. This includes 128 moderate light rail impacts, 4 severe light rail noise impacts, and 136 traffic noise impacts. It is important to note that all but nine of the units identified with traffic noise impacts would also have noise impacts related to light rail. The four sites identified with severe light rail noise impacts are all located near a crossover at SE 30th Street. Light rail noise levels under this alternative ranged from 52 to 75 dBA Ldn, with the highest noise levels, and severe impacts, occurring near the crossover near SE 30th Street.

6.1.4.3 112th SE At-Grade Alternative (B2A)

For Alternative B2A, a total of 78 light rail noise impacts were identified, including one severe impact near the crossover at SE 30th Street. Light rail operational noise levels are projected to range from 53 to 69 dBA Ldn at noise-sensitive properties along Bellevue Way SE and 112th Avenue SE, with one receiver near the crossover where noise levels are projected to reach 72 dBA Ldn before any mitigation measures are applied.

Alternative B2A would require some roadway widening along Bellevue Way SE, between the South Bellevue Station and the 112th Avenue SE intersection. Along 112th Avenue SE, Alternative B2A would replace the existing median, and minimal roadway modifications would be required. Future traffic noise levels with the project along Bellevue Way are projected to increase by up to 6 dBA, with future traffic noise levels of 66 to 72 dBA Leq during peak hours at affected residences. Under Alternative B2A, 17 residences are projected to have traffic noise impacts because of the roadway widening. The East Link Project would be required to consider mitigation for these residences.

6.1.4.4 112th SE Elevated Alternative (B2E)

Under Alternative B2E, 85 moderate and 21 severe noise impacts are projected. One severe impact occurs at a single-family residence near the crossover at SE 30th Street. North of the South Bellevue Transit Station, the proximity of the elevated structure to homes near SE 23rd Street and 109th Avenue SE would result in an additional 15 severe impacts. The remaining five severe impacts would be just south of Bellefield Residential Park Condominiums at a group of single-family residences off of SE 17th Street. Light rail-related noise levels range from 53 to 74 dBA Ldn at the 148 locations used in the noise analysis. Alternative B2E would require no substantial changes in the roadway alignments; therefore, no traffic noise impacts are projected.

6.1.4.5 112th SE Bypass Alternative (B3)

There were 79 moderate and 4 severe noise impacts identified for Alternative B3. One of the severe impacts would be due to the crossover at SE 30th Street. The remaining severe impacts would be to single-family residences just south of Surrey Downs Park, along 111th Avenue SE, because of the added noise associated with the elevated structure. Light rail-related noise levels at the 148 residences evaluated under this alternative ranged from 53 to 72 dBA Ldn.

Traffic noise impacts under Alternative B3 would be at the same 17 residences predicted with traffic noise impacts under Alternative B2A.

There were 76 moderate noise impacts and 1 severe impact identified for the B3 - 114th Extension Design Option. As with Alternative B3, a severe impact would occur due to the crossover at SE 30th Street. The other residences that would have severe impacts under Alternative B3 would not have a severe impact with this design option because of the added distance between the elevated guideway and the homes. Light rail-related noise levels at the 148 residences evaluated under this design option ranged from 53 to 72 dBA Ldn. Traffic noise impacts under B3 – 114th Extension Design Option would be the same as those described above for Alternative B2A.

6.1.4.6 BNSF Alternative (B7)

For Alternative B7, 108 moderate and 68 severe light rail noise impacts are projected along the corridor. Sixteen single-family residences near I-90, west of Bellevue Way SE, were identified with moderate noise impacts. Along the west side of the light rail route along 118th Avenue SE, there would be 160 noise impacts, of which 68 are projected to be in the FTA severe category, with the other 92 being moderate. Thirty of the severe noise impacts would be due to the nearby crossover, while the other 38 would result from the proximity to the tracks and the higher train speed under this alternative. Maps of the impacts are provided in Appendix A. Complete tabulated modeled noise levels for Alternative B7 are provided in Appendix E of this report. Alternative B7 would require no substantial changes in the roadway alignments; therefore, no traffic noise impacts are projected.

6.1.5 Segment C

Table 6-4 summarizes light rail noise impacts in Segment C, and a detailed description of the impacts for each alternative follows. The two preferred alternatives in Segment C, *Preferred 108th At-Grade Alternative (C11A)* and *Preferred 110th Tunnel Alternative (C9T)* (both from *Preferred Alternative B2M*) are compared in Table 6-5, and each alternative is discussed after that. Note that *Preferred Alternatives C11A* and *C9T* can also be connected to Alternative B3, B3 – 114th Extension Design Option, or B7; those connections are discussed below and included in Table 6-4. Traffic noise impacts were identified for the Bellevue Way Alternative (C1T) only and are discussed with that alternative. The remaining Segment C alternatives will not substantially change the existing roadway alignments, and therefore no traffic noise impacts were identified for these alternatives.

There are several parks and parklands in Segment C, including the Surrey Downs Park, Downtown Park, Ashwood Park, and McCormick Park. Surrey Downs Park is located along 112th Avenue SE, an established transportation corridor. The Downtown Park, as its name implies, is located in Downtown Bellevue near NE 2nd Street. Ashwood Park and McCormick Park are both located near NE 12th Street, which is also an established transportation corridor. These parks were all reviewed for sensitivity to noise. Since these parks do not have noise-sensitive uses and are located along established transportation corridors, none meet the FTA criteria for a noise-sensitive use; therefore, no light rail operational noise impacts were identified in Segment C.

Complete maps and tabulated modeled noise levels for Segment C alternatives are included in Appendices A and E of this report.

TABLE 6-4
Summary of Potential Noise Impacts for Segment C

Alternative	Connection (from Alternative)	Moderate Light Rail Impacts	Severe Light Rail Impacts	Traffic Noise Impacts
Preferred 108th NE At-Grade Alternative (C11A)	*Preferred 112th SE Modified Alternative (B2M)*	119	65	0
	112th SE Bypass (B3), B3 – 114th Extension Design Option, or BNSF (B7) Alternative	152	52	0
Preferred 110th NE Tunnel Alternative (C9T)	*Preferred 112th SE Modified Alternative (B2M)*	62	57	0
	Alternative B3, B3 – Design Option, or B7	88	52	0
C9T – East Main Station Design Option	*Preferred 112th SE Modified Alternative (B2M)*	67	52	0
Bellevue Way Tunnel Alternative (C1T) [a]	Bellevue Way Alternative (B1)	48	52	18
106th NE Tunnel Alternative (C2T)	112th SE At-Grade Alternative (B2A)	48	52	0
	112th SE Elevated Alternative (B2E)	113	66	0
	Alternative B3 or B7	66	70	0
108th NE Tunnel Alternative (C3T)	Alternative B2A	26	0	0
	Alternative B2E	91	14	0
	Alternative B3 or B7	44	18	0
Couplet Alternative (C4A)	Alternative B2A	435	15	0
	Alternative B2E			
	Alternative B3 or B7	420	19	0

TABLE 6-4 CONTINUED
Summary of Potential Noise Impacts for Segment C

Alternative	Connection (from Alternative)	Moderate Light Rail Impacts	Severe Light Rail Impacts	Traffic Noise Impacts
112th SE Elevated Alternative (C7E)	Alternative B2A or B2E	270	12	0
	Alternative B3 or B7	208	0	0
110th NE Elevated Alternative (C8E)	Alternative B3 or B7	353	72	0
110th NE At-Grade Alternative (C9A)	Alternative B2A	185	56	0
	Alternative B3, B3 – Design Option, or B7	145	54	0
114th NE Elevated Alternative (C14E)	Alternative B3, B3 – Design Option, or B7	36	112	0

[a] Under Alternative C1T all the traffic noise impacts are separate from light rail noise impacts. The total number of residences impacted (single- and multifamily) under this alternative would be 118; 100 would be impacted by light rail noise only, 18 would be impacted by traffic noise only, and 0 would be impacted by both traffic noise and light rail noise.

6.1.5.1 Preferred 108th NE At-Grade Alternative (C11A)

Under *Preferred Alternative C11A* from *Preferred Alternative B2M*, 119 moderate and 65 severe light rail noise impacts are predicted. Some of the severe impacts would occur at single-family homes along 111th Avenue SE because of a nearby crossover and loss of shielding from displaced buildings. Severe impacts, which are predicted at several multifamily units along 108th Avenue NE, would occur because of bells and proximity to the tracks. Finally, the severe noise impacts at the Lake Bellevue Village Condominiums would be due to lower impact criteria because this area has lower ambient noise levels. Severe impacts are also projected at the Coast Bellevue Hotel because of a nearby crossover and the proximity of the tracks to the hotel rooms. Along the at-grade segment through Downtown Bellevue, an additional 108 moderate noise impacts were identified. No roadway modifications would be required nor would there be any traffic noise impacts. Overall, the project-related noise levels were projected to range from 53 to 69 dBA Ldn, with the Coast Bellevue Hotel projected to have a severe impact and a projected 80 dBA Ldn due to a crossover and high train speed on the structure. No roadway realignment is planned as part of this alternative; therefore, no project-related traffic noise impacts are anticipated.

Preferred Alternative C11A from Alternatives B3, B7, or B3 – 114th Extension Design Option would result in 152 moderate and 52 severe light rail noise impacts. The severe impacts that would occur at the single-family residences along 111th Avenue SE would not occur under the Alternatives B3 or B7 connection options. Instead, there would be 36 new moderate noise impacts at the Hilton Hotel and 8 moderate impacts at single-family residences south of Main Street. Noise impacts in the downtown corridor, at the Coast Bellevue Hotel, and at Lake Bellevue Condominiums would be the same with connection options to Alternative B3, B3 – 114th Extension Design Option, or B7. The change in the number and severity of impacts under Alternatives B3, B7, or B3 – 114th Extension Design Option when compared to *Preferred Alternative B2M* is due to changes in the alignment related to the different alternative connection. The range of noise levels with the Alternative B3 or B7 connections would be the same as given under the *Preferred Alternative B2M* connection.

6.1.5.2 Preferred 110th NE Tunnel Alternative (C9T)

Noise levels under *Preferred Alternative C9T* from *Preferred Alternative B2M* would range from 48 to 79 dBA Ldn with 62 moderate and 57 severe impacts. The severe impacts would occur at five single family homes along 111th Place SE, a multifamily building on NE 6th Street in Downtown Bellevue and the Lake Bellevue Village

Condominiums. Depending on the location, the severe impacts would result from one or more of the following: proximity to the track, bells at crossings, and crossovers.

Under the C9T – East Main Station Design Option from *Preferred Alternative B2M*, the relocation of the crossover and insertion of the new station site would reduce the number of severe impacts when compared to the scenario with the SE 8th Street Station. The reduced noise from relocating the crossover is the reason for the reduction in the severity of impacts. There would still be a total of 119 noise impacts, however, with the East Main Station—52 severe and 67 moderate. No roadway modifications are predicted to result in a noticeable increase in traffic noise levels, and therefore no project-related traffic noise impacts are predicted.

Preferred Alternative C9T from Alternatives B3, B7, or B3 – 114th Extension Design Option would result in 88 moderate and 52 severe light rail noise impacts. With *Preferred Alternative B2M,* the total number of impacts would increase from 119 to 140. The change in the number of impacts, as with *Preferred Alternative C11A*, would be due to reduced noise impacts along 112th Avenue SE and an increase in noise impacts at the Hilton Hotel rooms facing toward the tracks. Impacts at the Coast Bellevue Hotel and the Lake Bellevue Condominiums would remain, along with impacts at four single-family homes south of Main Street. Table 6-5 compares the two Segment C *Preferred Alternatives*. This table summarizes in detail the number of moderate and severe impacts for each alternative by type of land use. As would be expected, the at-grade *Preferred Alternative C11A* would have more noise impacts than the tunnel *Preferred Alternative C9T*. The increased impacts would be along the at-grade segment on 108th Avenue NE in Downtown Bellevue.

TABLE 6-5
Noise Impact Comparison for Preferred Alternatives C11A or C9T from Preferred Alternative B2M

Total Impact Pre-Mitigation	**119**	**65**	**62**	**57**	**67**	**52**

6.1.5.3 Bellevue Way Tunnel Alternative (C1T)

There are 48 moderate and 52 severe light-rail-related noise impacts projected for the Bellevue Way Tunnel Alternative (C1T). The impacts would occur at multifamily units at The Bravern and Lake Bellevue Condominiums, and at the Coast Bellevue Hotel. Up to 16 units are projected to exceed the FTA severe impact criteria at Lake Bellevue Village Condominiums, and 48 units are projected to experience moderate impacts at The Bravern.

With Alternative C1T, the roadway would be widened, thereby moving the traffic lanes closer to several properties; this would result in traffic noise impacts on 18 multifamily units along Bellevue Way near the connection to Segment B. All 18 units are on the west side of Bellevue Way, between the retained-cut section and just north of the tunnel portal.

6.1.5.4 106th NE Tunnel Alternative (C2T)

Under Alternative C2T, the number of impacts would vary with the connection alternative. Connecting from Alternative B2A, there would be 48 moderate and 52 severe light rail noise impacts. The impacts would occur at multifamily units at Lake Bellevue, The Bravern, and the Coast Bellevue Hotel.

Connecting from Alternative B2E, the number of impacts would increase from a total of 100 under Alternative B2A to 179. The increased number of impacts is due to the elevated structure along 112th Avenue SE, where 47 impacts were identified, including 14 severe impacts due to the proximity to a crossover.

When connecting from Alternative B3 or B7, Alternative C2T would have moderate noise impacts on 48 multifamily units and 18 hotel rooms and severe impacts on 16 multifamily units and an additional 54 hotel rooms.

6.1.5.5 108th NE Tunnel Alternative (C3T)

Twenty-six moderate light rail noise impacts were identified under the 108th NE Tunnel Alternative (C3T) connecting from Alternative B2A. All 26 impacts would be near the tunnel portal along NE 12th Street. With Alternative C3T from Alternative B2E, there would be severe noise impacts at 2 single-family units and 12 multifamily units. The 14 severe impacts would be all along 112th Avenue SE and due to a double crossover. There would be 59 moderate impacts, comprised of 13 single-family and 46 multifamily units. The noise analysis also predicts 32 moderate impacts on the Bellevue Club hotel rooms facing 112th Avenue SE. Impacts with Alternative C3T from Alternative B2E would occur along 112th Avenue SE and near the tunnel portal along NE 12th Street.

When connecting from Alternative B3 or B7, Alternative C3T would have severe noise impacts on 18 hotel rooms and moderate impacts on 5 single-family units, 21 multifamily units, and 18 more hotel rooms. Alternative C3T would require no substantial changes in the roadway alignments; therefore, no traffic noise impacts are projected.

6.1.5.6 Couplet Alternative (C4A)

For the Couplet Alternative (C4A) connecting from Alternative B2A or B2E, there would be 15 severe noise impacts and 435 moderate noise impacts. The high numbers of noise impacts would be due to the dense multifamily units along the at-grade sections along 110th and 108th Avenues NE and NE 12th Street.

For the connections from Alternative B3 or B7, there would be moderate impacts on 13 single-family units, 365 multifamily units, and 42 hotel rooms along with severe impacts on 1 single-family unit and 18 hotel rooms. The severe noise impact at the single-family unit would be due to added noise from bells at the at-grade crossings.

6.1.5.7 112th NE Elevated Alternative (C7E)

Several noise impacts are projected for the 112th NE Elevated Alternative (C7E), and they vary depending on connection. Under the connection to Alternatives B2A or B2E, there would be severe noise impacts at 12 multifamily residential units south of Main Street due to crossovers. In addition to the 12 severe impacts, there are also moderate noise impacts at 40 single- and multifamily units south of Main Street and along 112th Avenue SE. As the alignment continues along 112th Avenue NE, an additional 228 moderate impacts were identified at multifamily units and hotels along the corridor. Finally, there are also 6 single-family residences north of NE 12th Street that would also exceed the FTA moderate criteria.

When connecting to Alternative B3 or B7, Alternative C7E would have moderate noise impacts at 208 single and multifamily residences, and several hotel rooms. There are no severe impacts projected under Alternative C7E from Alternatives B3 or B7. Maps of analysis and impact locations are provided in Appendix A.

6.1.5.8 110th NE Elevated Alternative (C8E)

Alternative C8E only connects to Alternative B3 or B7. Under Alternative C8E, 72 multifamily residences near NE 2nd Street are projected to have severe noise impacts due to the proximity of the elevated structure to the units. Moderate light rail-related noise impacts were also identified at an estimated 9 single-family units, 224 multifamily units, and 120 hotel rooms along elevated structure.

6.1.5.9 110th NE At-Grade Alternative (C9A)

Alternative C9A connecting to Alternative B2A is projected to have 56 severe impacts and 185 moderate impacts. Severe impacts at 4 single-family residences would be due to crossovers and bells, while the 16 multifamily severe impacts at the Lake Bellevue Condominiums would be due to the low existing noise levels in this area. The remaining 36 severe impacts would be at the Coast Bellevue Hotel, due to a double crossover and higher train speed.

With a connection from Alternative B3, B3 – 114th Extension Design Option, or B7, the total number of impacts would be reduced from 241 to 199, with 54 severe impacts. The severe impacts are related to bells south of Main Street, proximity and speed at the Coast Bellevue Hotel, and impacts at the same units as described above at the Lake Bellevue Condominiums.

6.1.5.10 114th NE Elevated Alternative (C14E)

Alternative C14E only connects to Alternative B3, B3 – 114th Extension Design Option, or B7 and remains near I-405 along 114th Avenue NE. It connects to Segment D near the Lake Bellevue Condominiums, where 16 severe impacts are projected. Alternative C14E would also have severe impacts at 96 hotel rooms and moderate impacts at an additional 36 hotel rooms.

6.1.6 Segment D

Table 6-6 summarizes light rail noise impacts in Segment D, and the impacts for each alternative are then described in detail. There would be no substantial changes to the existing roadway alignments in Segment D; therefore, no traffic noise impacts were identified for these alternatives. There are no noise-sensitive parks located near any of the project alternatives in Segment D. For each Segment D alternative, detailed impact figures are provided in Appendix A, and noise level tables are provided in Appendix E.

TABLE 6-6
Summary of Potential Noise Impacts for Segment D

Alternative	Connection (from Alternative)	Moderate Light Rail Impacts	Severe Light Rail Impacts	Traffic Noise Impacts
Preferred NE 16th At-Grade Alternative (D2A)	*C11A*, *C9T*, C1T, C2T, C9A, and C14E (former BNSF Railway corridor)	0	0	0
D2A - 120th Station Design Option or D2A - NE 24th Design Option	*C11A*, *C9T*, C1T, C2T, C9A, and C14E (former BNSF Railway corridor)	0	0	0
NE 16th Elevated Alternative (D2E)	*C11A*, *C9T*, C1T, C2T, C9A, and C14E (former BNSF Railway corridor)	1	0	0
	C3T, C4A, C7E, or C8E (NE 12th Street)	2	0	0
NE 20th Alternative (D3)	*C11A*, *C9T*, C1T, C2T, C9A, and C14E (former BNSF Railway corridor)	0	0	0
	C3T, C4A, C7E, or C8E (NE 12th Street)	1	0	0
SR 520 Alternative (D5)	*C11A*, *C9T*, C1T, C2T, C9A, and C14E (former BNSF Railway corridor)	0	10	0
	C3T, C4A, C7E, or C8E (NE 12th Street)	1	10	0

6.1.6.1 Preferred NE 16th At-Grade Alternative (D2A)

Under *Preferred NE 16th At-Grade Alternative (D2A)* connecting to *Preferred Alternative C11A* or *C9T* and Alternative C1T, C2T, C9A, or C14E (the former BNSF Railway corridor alternatives), there are no noise impacts projected because the alternatives are located along commercial and industrial land uses in Segment D. The only noise-sensitive land use is the Pacific Northwest Ballet School, located in an industrial building at the intersection of NE 16th Street and 136th Place NE. Noise levels from light rail operations at the school are predicted to be 62 dBA Leq during peak hour operations, which is below the impact criteria of 63 dBA Leq. Noise impacts with the D2A design options (120th Station or D2A - NE 24th, with or without the 130th Station) would be the same as with *Preferred Alternative D2A*.

6.1.6.2 NE 16th Elevated Alternative (D2E)

Noise impacts under the NE 16th Elevated Alternative (D2E) would include a moderate impact at the Pacific Northwest Ballet School because of the added noise from the elevated structure. If connected to the alternatives along the former BNSF Railway corridor, then there would be no other noise impacts; however, with a connection to the NE 12th Street alternatives, there would be an additional moderate noise impact at the Children's Hospital BCSC.

6.1.6.3 NE 20th Alternative (D3)

There would be no noise impacts with the NE 20th Alternative (D3) if connecting from Segment C alternatives along the former BNSF Railway corridor. However, with a connection to the NE 12th Street alternatives, there would be one moderate noise impact at the Children's Hospital BCSC. There would be no impact on the Pacific Northwest Ballet School.

6.1.6.4 SR 520 Alternative (D5)

Severe noise impacts under the SR 520 Alternative (D5) are predicted at 10 multifamily units just south of SR 520 near Northup Way. Additionally, if Alternative D5 were connected to the NE 12th Street alternatives, then there would be one moderate noise impact at the Children's Hospital BCSC. If, however, Alternative D5 were connected to Segment C alternatives along the former BNSF Railway corridor, then there would be no additional noise impacts besides those 10 at the multifamily units near SR 520.

6.1.7 Segment E

Light rail noise impacts in Segment E would occur under all Segment E alternatives, as shown in Table 6-7. The Segment E alternatives would not substantially change the existing roadway alignments; therefore, no traffic noise impacts were identified for these alternatives.

Parks and trails in Segment E include Marymoor Park, Luke McRedmond Landing Park, Dudley Carter Park, the Edge Skate Park, and the Sammamish River, East Lake Sammamish, and Bear Creek trails. Marymoor Park could be divided into three distinct sections: the section along SR 520, the central section, and the portion near Lake Sammamish. The section near SR 520 and the central section of Marymoor Park are primarily used for active sports; concerts; major events, such as circuses; and other events with large crowds, and/or amplified music or entertainment. These sections of the park are also located near SR 520 and adjacent to a commercial and industrial area to the east. Therefore, the sections of Marymoor Park along SR 520 and the central section would not be considered noise-sensitive under FTA criteria. Only the southern section of the Marymoor Park, near Lake Sammamish, was determined to meet the FTA criteria for a noise-sensitive area in a park. Because the project alternatives are approximately 2,500 to 3,000 feet or more from this section of the park, project noise levels are predicted to be below ambient noise levels and below FTA criteria, and no noise impacts are projected. The Luke McRedmond Landing Park, Dudley Carter Park, Edge Skate Park, and the Sammamish River, East Lake Sammamish, and Bear Creek trails parks are located along established transportation corridors, and therefore none meets the FTA criteria for a noise-sensitive use.

Maps of the Segment E alternatives impacts are in Appendix A, and complete tabulated modeled noise levels are included in Appendix E.

TABLE 6-7
Summary of Potential Noise Impacts for Segment E

Alternative	Connection (from Alternative)	Moderate Light Rail Impacts	Severe Light Rail Impacts	Traffic Noise Impacts
Preferred Marymoor Alternative (E2)	All Segment D alternatives	33	148	0
E2 - Redmond Transit Center Design Option	All Segment D alternatives	81	100	0
Redmond Way Alternative (E1)	All Segment D alternatives	167	150	0
Leary Way Alternative (E4)	All Segment D alternatives	66	32	0

6.1.7.1 Preferred Marymoor Alternative (E2)

Under *Preferred Alternative E2* there would be 148 severe and 33 moderate noise impacts; these include 9 moderate and 4 severe single-family impacts near SR 520 at West Lake Sammamish Parkway NE, 144 severe impacts at newly constructed multifamily units, and 24 moderate impacts at a hotel. The four single-family severe noise impacts would be due the higher speed and the elevated structure. The remaining 144 severe noise impacts would be related to multiple gated crossings and station bells along the former BNSF Railway corridor. No traffic noise impacts are projected because there would be no roadway alignment changes in this segment.

The total number of noise impacts under the E2 - Redmond Transit Center Design Option would be the same as *Preferred Alternative E2*; however, under this design option, 81 of the impacts would be moderate and 100 would be severe. This difference is because one of the newly constructed multifamily buildings would not have noise impacts as it would under *Preferred Alternative E2*; however, another multifamily building near the Redmond Transit Center terminus would have the same number (48) moderate noise impacts.

6.1.7.2 Redmond Way Alternative (E1)

Under Alternative E1, light rail noise impacts were identified at 9 single-family units, 236 multifamily units, and 72 hotel rooms; these include severe impacts at two single-family residences and 148 multifamily units. As with *Preferred Alternative E2*, the severe impacts at the multifamily units would be due to multiple gated crossings and station bells along the former BNSF Railway corridor.

6.1.7.3 Leary Way Alternative (E4)

Alternative E4 would have 66 moderate impacts and 32 severe impacts related to light rail operations. The 8 multifamily severe impacts would be due to the extra noise from the elevated structure, while the 24 severe impacts at the Residence Inn Hotel would be due to bells at gated crossing. No traffic impacts were identified.

6.1.8 Wheel Squeal

Wheel squeal is caused by the oscillation of the wheel against the rail on curved sections of rail. Wheel squeal noise levels were measured at several different locations along the Central Link corridor and were used for reference. Based on these measurements, curves with a radius of less than 600 feet can produce maximum noise levels of 83 to 85 dBA at 50 feet. The highest noise levels typically occur on tight radii curves of less than 100 to 300 feet.

Substantial research into methods of reducing wheel squeal noise, including using lubricants that are not oil-based (such as water), has found such methods to effectively reduce or eliminate wheel squeal. The lubricants can be applied by personnel working trackside or by an automated applicator. Because the East Link Project would maintain a method of reducing or eliminating wheel squeal if it were to occur, no wheel squeal impacts are projected.

6.1.8.1 Preferred Alternative Wheel Squeal Analysis

The *Preferred Alternative* (*Preferred Alternatives A1, B2M, C11A* or *C9T, D2A,* and *E2*) was evaluated for any curves where, based on experience on the existing Central Link light rail system, wheel squeal could result. During final design, these curves will be reevaluated and have wayside lubricators installed as part of project construction. Table 6-8 lists the locations of curves to be evaluated for lubricator installation. Also, note that if any additional curves are planned during final design, then they will be evaluated for potential wheel squeal and treated with wayside lubricators as necessary.

6.1.8.2 Wheel Squeal under Other Alternatives

The project corridor was evaluated for locations with tight radii curves where wheel squeal could occur. In Segment B, there are no curves with a radius of less than 300 feet, so no wheel squeal is projected. Segment A has one location, and Segment C has several locations with tight radius curves, including Alternatives C4A, C7E, and C8E. Areas with tight radii curves in Segment D include Alternatives D2E and D3 connecting from Alternative C1T or C2T. Alternatives D2E and D3 also could experience wheel squeal on 136th Place NE and at the intersection of NE 20th Street and 152nd Avenue NE, respectively. Segment E could experience wheel squeal near Redmond Way at SR 520 with all Segment E alternatives. Table 6-9 provides a summary of curves for the other alternatives. Two design options are not listed in this table because curves with the C9T – East Main Station

Design Option would not differ from *Preferred Alternative C9T*, and curves with the D2A – 120th Station Design Option would not differ from *Preferred Alternative D2A*.

TABLE 6-8
Preferred Alternative Curves where Wayside Lubrication would be Evaluated and Installed as Part of the Project Construction

Preferred Alternative	Area	Radius (feet)	Lubricator Notes
Preferred Interstate 90 Alternative (A1)	Entry to I-90 express lanes	235	Potential – no receivers
	I-90 near South Dearborn Street	586	Potential – no receivers
	I-90 at Rainier Avenue South	990	No
	Mercer Island west end	More than 1,000	No – in tunnel
Preferred 112th SE Modified Alternative (B2M) with connections to *Preferred Alternative C11A* or *C9T*	I-90 near Bellevue Way and SE 34th Avenue	510	Yes
	Bellevue Way, south of SE 30th Street	780	Potential – reevaluation during design
	Bellevue Way at 112th Avenue SE	1,200	No
	112th Avenue SE north of SE 15th Street	900	Potential – reevaluation during design
Preferred 108th NE At-Grade Alternative (C11A)	112th Avenue SE at Main Street	300	Yes
	Main Street at 108th Avenue NE	120	Yes
	108th Avenue NE at NE 6th Street	120	Yes
	116th Avenue NE to NE 8th Street	510	Yes
Preferred 110th NE Tunnel Alternative (C9T)	112th Avenue SE at Main Street	300	Yes
	Main Street at 108th Avenue NE	120	No – in tunnel
	108th Avenue NE at NE 6th Street	120	No – in tunnel
	116th Avenue NE to NE 8th Street	510	Yes
Preferred NE 16th At-Grade Alternative (D2A)	BNSF Railway east toward 120th Avenue NE and NE 16th Street	510	Yes
	NE 16th Street to 136th Place NW	400	Yes
	136th Place NW to SR 520	510	Potential – reevaluation during design
Preferred Marymoor Alternative (E2)	SR 520 to Marymoor Park	1,800	No
	Redmond Way to old freight corridor	300	Yes

TABLE 6-9
Summary of Curves with Potential Wheel Squeal with Non-Preferred Alternatives

Alternative	**Curves with Radius of 600 feet or less**
Segment B	
Bellevue Way Alternative (B1)	I-90 to Bellevue Way
112th SE At-Grade Alternative (B2A)	I-90 to Bellevue Way
112th SE Elevated Alternative (B2E)	I-90 to Bellevue Way
112th SE Bypass Alternative (B3)	I-90 to Bellevue Way; SE 8th Street to I-405
B3 - 114th SE Design Option	I-90 to Bellevue Way; 112th Avenue SE to the commercial area
BNSF Alternative (B7)	I-90 to I-405/118th Avenue SE
Segment C[a]	
Bellevue Way Tunnel Alternative (C1T)	NE 6th Street to the former BNSF Railway corridor
106th NE Tunnel Alternative (C2T)	Main Street (B2A, B3, B7); NE 6th Street to the former BNSF Railway corridor

TABLE 6-9 CONTINUED
Summary of Curves with Potential Wheel Squeal with Non-Preferred Alternatives

Alternative	**Curves with Radius of 600 feet or less**
108th NE Tunnel Alternative (C3T)	Main Street (B2A, B3, B7); 112th Avenue NE at NE 12th Street
Couplet Alternative (C4A)	Main Street (B2A, B3, B7); Main Street and 110th Avenue NE; Main Street and 108th Avenue NE; NE 12th Street and 110th Avenue NE; NE 12th Street and 108th Avenue NE; 112th Avenue NE along NE 12th Street
112th NE Elevated Alternative (C7E)	112th Avenue NE along NE 12th Street (all connections); t112th Avenue SE south of Main Street (B3 and B7)
110th NE Elevated Alternative (C8E)	114th Avenue NE to NE 2nd Street; NE 2nd Street to 108th Avenue NE; 108th Avenue NE to NE 12th Street; 112th Avenue NE along NE 12th Street (all connections)
110th NE At-Grade Alternative (C9A)	Main Street from 112th Avenue SE; Main Street to 108th Avenue NE; 108th Avenue NE to NE 6th Street; NE 6th Street to the former BNSF Railway corridor; south of the Hilton Hotel under B3 - 114th Extension Design Option
114th NE Elevated Alternative (C14E)	I-405 at NE 7th Street; NE 7th Street to the former BNSF Railway corridor; South of the Hilton Hotel under B3 - 114th Extension Design Option
Segment D[b]	
D2A – NE 24th Design Option	Former BNSF Railway corridor to NE 16th Street; NE 16th Street to 134th Avenue NE; 134th Avenue NE to SR 520; NE 24th Street to 152nd Avenue NE; 152nd Avenue NE to SR 520
NE 16th Elevated Alternative (D2E)	Former BNSF Railway corridor to NE 16th Street; NE 16th Street to 134th Avenue NE; 134th Avenue NE to SR 520; NE 24th Street and 152nd Avenue NE; 152nd Avenue NE and SR 520
NE 20th Alternative (D3)	Former BNSF Railway corridor to NE 16th Street; NE 16th Street to 134th Avenue NE; 134th Avenue NE and NE 20th Street; NE 20th Street and 152nd Avenue NE; 152nd Avenue NE and SR 520
SR 520 Alternative (D5)	NE 12th Street (C3T, C4A, C7E, and C8E); two curves between NE 16th Street and SR 520; 152nd Avenue NE; 152nd Avenue NE to SR 520
Maintenance Facilities	All alternatives
Segment E	
E2 - Redmond Transit Center Design Option	SR 520 and Redmond Way; 161st Avenue NE to the Redmond Transit Center
Redmond Way Alternative (E1)	SR 520 to the elevated structure; Redmond Way; former BNSF Railway corridor
Leary Way Alternative (E4)	“S” curves from SR 520 to Leary Way; Leary Way to the former BNSF Railway corridor
Maintenance Facilities	All alternatives

[a] Curves with the C9T – East Main Station Design Option would not differ from *Preferred Alternative C9T*. See Table 6-8.
[b] Curves with the D2A – 120th Station Design Option would not differ from *Preferred Alternative D2A*. See Table 6-8.

6.1.9 Maintenance Facility Alternatives

There are three maintenance facility alternative sites in Segment D: 116th Maintenance Facility (MF1), BNSF Maintenance Facility (MF2), and SR 520 Maintenance Facility (MF3). MF1 is located along 116th Avenue NE, just west of the former BNSF Railway corridor. MF2 is located just east of MF1 in an established industrial area. MF3 is located along the south side of SR 520, also in an established industrial area. MF1 is the only potential maintenance facility located near residential properties because there are several single-family residences to the west of the proposed site. The new Seattle Children’s Hospital BCSC is also located south of the MF1 site. There are also several other residential-style structures along 116th Avenue NE that have been converted to office spaces.

Because light rail maintenance facilities would be in operation 24 hours a day, 7 days a week, with much of the services being performed at night when the system is not in operation, nighttime noise can be an issue. Because a maintenance facility is considered a stationary transit facility and fixed commercial use (WAC 173-60 Class B EDNA), it would be required to meet the City of Bellevue noise regulations for industrial properties. When a final maintenance facility site is selected, a full site design with the location of noise-producing sources would be completed, and a detailed noise analysis would be performed to ensure compliance with the City of Bellevue noise control ordinance. However, because MF1 is near residences and a hospital, a detailed noise analysis of the operations was conducted. The following information and assumptions, consistent with the FTA methods and criteria, were used for the MF1 noise analysis:

- Measured noise levels taken at the existing Sound Transit maintenance facility in South Seattle were used as baseline data.
- Train speeds would be limited to 5 mph inside the facility and horns would be sounded for at-grade employee crossings for safety.
- Wheel squeal noise on the tight radius curves would not be as severe as noise from normal train operations outside the maintenance facility because of the slower speed and because some form of lubrication or friction modifier would be used to contain noise from wheel squeal.
- The majority of noise-producing maintenance operations would occur inside the facility building, shielding nearby properties from the operations.
- The typical maximum number of trains at the facility is based on the proposed size and is not likely to exceed 40 to 50 light rail vehicles at any one time.

Using the above assumptions, worst-case operational noise levels were projected at six single-family residences along 116th Avenue NE and the Children’s Hospital BCSC. The projected 24-hour Ldn ranged from 48 to 57 dBA at the sensitive receivers near MF1. A moderate noise impact was identified under the FTA criteria at the rear of the Children’s Hospital BCSC. The impact would be due to the lower existing Ldn at the rear of the building, which results from the shielding the building provides from traffic noise along NE 12th Street. The noise analysis also included two single-family residences that are located immediately west of MF1 across 116th Avenue NE, and four single-family residences located slightly farther west, and no noise impacts were identified at these six residences. It is important to note that most of the structures along 116th Avenue NE have been converted to commercial use.

A noise analysis was not conducted for the other two Segment D maintenance facility alternatives (MF2 and MF3) because there are no noise-sensitive properties nearby. Therefore, no noise impacts related to the operation of MF2 or MF3 are anticipated.

If one of these maintenance facility alternatives were selected, then a full site design with the location of noise-producing sources would be completed, and a detailed noise analysis would be performed to ensure compliance with the City of Bellevue noise control ordinance. It is assumed that because this is a fixed site, with most noise-producing activities occurring indoors, any potential noise-related issues would be remedied through design modifications or treatments.

There is one maintenance facility alternative in Segment E, the SE Redmond Maintenance Facility (MF5), with two potential site locations. Both of the MF5 sites are located near the end of SR 520, in an established industrial area, with no nearby noise-sensitive properties. Due to the location of Alternative MF5, no noise analysis was conducted and no impacts are anticipated; however, when the site design is finalized, a detailed noise analysis would be performed to ensure compliance with the City of Redmond noise control ordinance.

6.1.10 Park-and-Ride Facilities

Most park-and-ride lots proposed as part of the East Link Project are at or near existing park–and-ride lots, and no noise impacts are projected. In Segment A, no new park-and-rides are planned, and all light rail stations are along I-90. Therefore, there no noise-related impacts would result from park-and-rides in Segment A.

The only park-and-ride with *Preferred Alternative B2M* is the park-and-ride lot at the South Bellevue Station, which is the same regardless of the connection to Segment C, and would be part of all Segment B alternatives except Alternative B7. The South Bellevue Park-and-Ride Lot is an existing facility, and under the proposed project, the facility would be improved to hold approximately 1,400 vehicles. Noise levels for park-and-ride operations were predicted using worst-case operational assumptions that all 1,400 parking spots would be used, and that approximately 450 buses would serve the facility in addition to light rail. The nearest residential properties to the park-and-ride lot are located west of the facility at 100 to 200 feet from the entrance and bus access areas. The projected Ldn at 100 feet from the park–and-ride is 60 dBA Ldn. Based on the existing Ldn noise levels of 67 to 69 dBA, the FTA criteria of 63 to 64 dBA Ldn is not predicted to be exceeded, and no noise impacts were identified. During final design, final station layout and bus route and light rail operations will be reviewed to ensure compliance with the City of Bellevue noise control ordinance. Under Alternative B7, a new park-and-ride lot would be constructed at the 118th Avenue Station. The station would be located along I-405, and no noise impacts were identified because of the high existing noise levels and lack of adjacent noise-sensitive receivers.

There are no new park-and-rides planned in Segment C. Noise from station activities, including bells from trains arriving and departing, are included in the segment analysis (Section 6.1.5).

There are three potential park-and–ride lots with *Preferred Alternative D2A*: a new park-and-ride near the 120th Station; a new park-and-ride near the 130th Station; and expansion of the existing park-and-ride at the Overlake Transit Center Station near SR 520 and NE 40th Street. The new park-and-ride lots near the 120th and 130th Stations are both in existing industrial and commercial areas where no noise-sensitive receivers were identified; therefore, no noise impacts are projected. The expanded park-and-ride at Overlake Transit Center has no noise-sensitive receivers that would be impacted by facility operation. Under Alternatives D2E and D3, the park-and-ride lot at the 130th Station would have no noise impacts, similar to *Preferred Alternative D2A*. An existing park-and-ride lot near the Overlake Village Station on 152nd Avenue NE would remain under Alternatives D2E and D3, and no noise impacts are predicted. Alternatives D2E, D3, and D5 would have a park-and-ride at the Overlake Transit Center Station at the existing Overlake Transit Center near SR 520 and NE 40th Street. The Overlake Transit Center is an existing facility, and no noise-sensitive receivers are predicted to have impacts related to the new park-and-ride operations.

The park-and-ride lot with *Preferred Alternative E2* is located near an established commercial and industrial area east of Marymoor Park. No noise impacts are predicted at this site because of the existing land use, high existing noise levels from SR 520, and the commercial and industrial uses near the site.

6.1.11 Freeway Noise at Proposed Freeway Stations

One additional noise assessment was conducted due to the unique position of some proposed stations in the center of or above a freeway in locations where freeway traffic noise might affect East Link patrons. This noise assessment only pertains to the Rainier and Mercer Island Stations in Segment A and the Ashwood/Hospital Station in Segment C, where the station is directly above I-405. The detailed analysis is provided in Appendix F.

There are no federal standards for noise exposure from traffic noise on patrons at stations. Sound Transit has generally used a design goal of 78 dBA Leq (15-minute and 1-hour) for noise from exterior sources at station platforms. The National Institute for Occupations Safety and Health (NIOSHA) standard for workplace noise exposure is 85 dBA for up to 8 hours or 100 dBA for 15 minutes (NIOSHA, 1998). For comparison, measurements taken at the SR 520 Montlake and Evergreen Road flyer stops ranged from 76 to 89 dBA Leq at the Montlake flyer stop and 72 to 75 dBA Leq at the Evergreen flyer stop. The EPA states that communication at close proximity (2 to 4 feet) can be understood, even with ambient noise levels of 72 to 78 dBA (EPA, 1974). It is unlikely that a patron would spend more than 15 minutes at an East Link station platform.

Based on bus flyer stop measurements and the short amount of time a person would spend at the station, Sound Transit will use a 78 dBA 15-minute Leq platform noise level goal for stations that are not able to meet the 72-dBA design goal due to traffic noise.

Traffic noise levels on I-90 and I-405 are loudest during the midday from 11 a.m. to 3 p.m. due to the higher speeds and level of truck traffic. Peak commute traffic noise levels on these same highways are typically lower (by 2 to 3 dBA) due to reduced speeds associated with congested highways. Based on these factors, the maximum traffic noise levels during the daytime were used in the analysis. The analysis also assumes the worst-case, 15-minute headways for the maximum time a person would spend at a platform.

Using typical daytime traffic volumes and speed provided by traffic engineers, a noise model was constructed using the FHWA traffic noise model (TNM), which produces hourly Leq noise levels based on hourly traffic volumes. For transit stations near major highways, a short-term Leq measurement of 10 minutes is typically long enough to provide an accurate reading of the noise exposure. This is due to the relatively steady noise from passing vehicles on major highways such as I-90. Measurements at the Mercer Island and Ashwood/Hospital stations verified this, as the running Leq stabilized after only 2 minutes of measurements and varied by less than 1 dBA after 5 minutes, even during heavy truck passbys where 1-second Leq sound levels exceeded 92 dBA. Because of the constant traffic volumes on a major highway like I-90, the short-term Leq experienced by patrons at the stations would be the same as the hourly Leq.

6.1.11.1 Rainier Station

Noise readings were taken at the proposed station location below the 23rd Avenue South overpass. The 15-minute Leq was measured at 86.3 dBA Leq. Five receivers were modeled along the proposed platform, with two at each end and one in the middle. The modeled noise levels ranged from 84.6 to 85.3 dBA Leq, which verified the accuracy of the model against the noise reading but also exceeded the 78 dBA goal for platform noise.

Ten-foot sound walls were modeled on the outside of the light rail station, along the edge the I-90 mainlines. With the walls in place, the noise levels along the platform were reduced by 8.2 to 9.7 dBA. Table 6-10 summarizes the noise model results along five points (Receivers R1 through R5) of the station platform with and without the sound walls.

TABLE 6-10
Rainier Station Noise Analysis

Receiver No.	Measured Levels (dBA)	Modeled Levels (dBA)	Modeled Levels with Sound Walls (dBA)	Sound Wall Reduction (dBA)	Wall Details
R1	N/A	85.3	76.4	8.9	These are 10-foot walls along the outside of the tracks, between the rail alignment and the I-90 traffic lanes; they could be integrated with the crash barriers to save room.
R2	N/A	85.1	76.9	8.2	
R3	N/A	85.0	75.8	9.2	
R4	N/A	84.9	75.2	9.7	
R5	86.3	84.6	75.4	9.2	

With sound walls, the platform would have noise levels below 78 dBA. The walls are proposed to extend approximately 800 feet west of the Mount Baker Tunnel portals. Sound walls would be designed during project final design.

6.1.11.2 Mercer Island Station

Noise readings were taken at the proposed Mercer Island Station location below the 77th Avenue SE overpass. Two receivers located along the platform (R2 and R3) were modeled, and the modeled noise at both locations was 88 dBA Leq (Table 6-11).

TABLE 6-11
Mercer Island Station Noise Analysis

Receiver No.	Measured Levels (dBA)	Modeled Levels[a] (dBA)	Modeled Levels with Sound Walls (dBA)	Sound Wall Reduction (dBA)	Wall Details
R2	N/A	87.9	77.6	10.3	These are 10-foot walls along the outside of the tracks, with the base of the wall at the same elevation as the tracks.
R3	N/A	87.9	78.3	9.6	

[a] The 87-dBA Leq is an average of the two measurement sessions.

By adding 10-foot sound walls on the outside of the light rail route along the edge nearest the train tracks, physically blocking the traffic noise on both sides of I-90 (see Appendix F for more information), the modeled noise levels along the platform were reduced by 10 dBA at the center of the platform. Table 6-11 summarizes the noise modeling results with and without the sound walls.

6.1.11.3 Ashwood/Hospital Station

Noise modeling for the proposed Ashwood/Hospital Station was performed using projected 2030 traffic data and speeds for I-405. For patrons on the station platforms, noise levels would range from 75 to 78 dBA Leq. The lower noise levels on the platform would be due to the noise-reducing effects of the light rail route and bridge over I-405. Because the noise levels at the platform are projected to remain below 78 dBA Leq, no noise-reducing design improvements were investigated.

6.1.11.4 Overlake Station and Overlake Transit Center

Both of Overlake and Overlake Transit Center Stations are located along SR 520, and the highway is the dominant noise source at each location. Existing noise levels from traffic along this section of the corridor were recently measured at 60 to 69 dBA Leq and remain below the 72 dBA Leq design criteria, and no additional noise mitigation would be required at either location.

6.2 Light Rail Vibration and Groundborne Noise Impact Assessment

The approach used for assessing vibration impact uses many of the same inputs as the noise impact assessment, such as speed, frequency of vehicle events, and distance from the receiver to the tracks. The vibration impact assessment combines vehicle characteristics with soil propagation properties to estimate vibration levels at sensitive receptors. The FTA impact threshold for residential (Category 2) nighttime vibration is 72 VdB in each 1/3-octave band for a detailed vibration assessment. There is only one Category 3 receptor (the Winters House) identified with groundborne noise impact along any of the proposed segments. The FTA impact threshold for residential groundborne noise is 35 dBA. As stated in Chapter 3 of this report, groundborne noise is only assessed for tunnel sections or for buildings that have sensitive interior spaces that are well-insulated from exterior noise.

For each East Link segment, a table is provided below that lists the locations, the distance to the nearest track, and the projected speed at each location. In addition, the projected project vibration level or groundborne noise level and the impact criterion level are indicated along with the number of impacts (single-family or multifamily buildings) projected for each receptor. The number of actual impacts in each building will be determined during final engineering and design. All impacts described in this section are shown in Appendix A of this report, with individual maps for each alternative that would have noise and/or vibration impacts. In multistory buildings, vibration levels generally decrease as the vibration travels up through the building, and therefore impacts are not likely to be felt above the first few floors, depending on the type of building construction.

The impacts reported in this section are before mitigation and do not include mitigation measures for potential vibration and groundborne noise levels and impacts reported in this section. Mitigation for potential impacts is discussed in Section 7.5.

6.2.1 Segment A, *Preferred Interstate 90 Alternative (A1)*

Table 6-12 provides the estimated vibration-velocity levels for sensitive receptors at representative distances. No vibration impacts were identified in Segment A. Table 6-13 shows the estimated groundborne noise levels for sensitive receptors. The project vibration or groundborne noise level listed is the maximum for that location. In many cases, the vibration or groundborne noise levels for other receptors would be much lower than the reported value. The following section provides a brief description of the Category 2 land use area impacted by groundborne noise, identified in Table 6-13.

TABLE 6-12
Segment A Vibration Impacts

Location	Distance to Near Track (feet)	Speed (mph)	Maximum Vibration Level	1/3-Octave Band	Vibration Impact Criterion	No. of Impacts
12th Avenue South to 23rd Avenue South	288	55	56	40	72	0
23rd Avenue South to Martin Luther King, Jr. Way South	134	55	61	40	72	0
Martin Luther King, Jr. Way South to Lake Washington	146	55	66	40	72	0
Mercer Island to West Mercer Way	160	50	57	12.5	72	0
West Mercer Way to 76th Avenue SE	202	50	56	12.5	72	0
76th Avenue SE to SE Shorewood Drive	187	55	59	12.5	72	0
SE Shorewood Drive to Lake Washington	179	55	60	12.5	72	0
					Total	**0**

Notes:
Vibration levels are measured in VdB referenced to 1 microinch per second.
The reported vibration level represents the maximum vibration level for each location.
The maximum vibration level reported is for the 1/3-octave band noted.
All reported distances are slant distances from the top of rail for tunnel sections.

TABLE 6-13
Segment A Groundborne Noise Impacts

Location	Distance to Near Track (feet)	Speed (mph)	Maximum Groundborne Noise Level (dBA)	Impact Criterion (dBA)	No. of Impacts
Martin Luther King, Jr. Way South to Lake Washington	146	55	41	35	25 single-family
				Total	**25 single-family**

Notes:
The reported groundborne noise level represents the maximum level for each location.
All reported distances are slant distances from the top of rail for tunnel sections.

Martin Luther King Jr. Way south to Lake Washington: There are 25 buildings with projected groundborne noise impact; these 25 single-family residences are located above the I-90 Mount Baker Tunnel. Groundborne noise impacts are projected at this location because of efficient propagation of high-frequency vibration. However, the impact assessment at this location is based on a surface propagation test above the tunnel. During further engineering and design of the project, propagation testing should be conducted in the Mount Baker Tunnel to determine if the propagation of groundborne noise from the tunnel would occur as projected.

At the East Link Project connection with the Central Link light rail system, there will be four new switches introduced to allow trains to operate on both light rail systems. These would be located under residential and mixed-use buildings. In order to keep East Link vibration levels the same as from Central Link system operations, special trackwork, such as movable point or spring rail frogs, would be needed at this location.

6.2.2 Segment B

6.2.2.1 Preferred 112th SE Modified Alternative (B2M)

Table 6-14 provides the estimated vibration velocity levels and impacts in Segment B for sensitive receptors at representative distances. Under *Preferred Alternative B2M*, there would be no vibration impacts and only one groundborne noise impact (see Table 6-15) at the Winters House. The Winters House is no longer used as a residence and is occupied by the Eastside Heritage Center; therefore, it is considered a Category 3 land use—an institutional land use with primarily daytime use—for purposes of vibration and groundborne noise analysis. The FTA impact criteria for groundborne noise, measured in weighted decibels (dBA), are 40 dBA. A groundborne noise impact is projected at the Winters House because of the proximity of the alignment to the foundation of the building. The projected groundborne noise levels would range from 44 to 54 dBA.

For the Winters House, the operational vibration levels, measured in VdB, are projected to be 76 VdB, which would be below the FTA detailed impact criteria of 78 VdB for human annoyance. In addition, the projected operational vibration levels would be well below even the most stringent criteria for damage to structures, which is 90 VdB for buildings extremely susceptible to vibration. The Winters House is in a slightly less susceptible category, which is for nonengineered timber and masonry buildings, with a 94 VdB criteria for damage.

Under *Preferred Alternative B2M* with the C9T – East Main Station Design Option, there would be one vibration impact at a single-family residence due to the relocated crossover at SE 8th Street as well as the same groundborne noise impact at the Winters House as described in the previous paragraphs.

6.2.2.2 Other Segment B Alternatives

Table 6-14 identifies a vibration impact at one Category 2 building with Alternative B1, as described below. No groundborne noise impacts were identified because there are no tunnels in this segment.

Bellevue Way SE and 112th Avenue SE to SE 10th Street: There is one single-family residence at this location that is projected to have a vibration impact. The impact would be due to the proximity of the residence and the efficient propagation of vibration through the soil at this location.

No vibration impacts were identified for the remaining Segment B alternatives.

TABLE 6-14
Segment B Vibration Impacts

Alternative	Location	Distance to Near Track (feet)	Speed (mph)	Maximum Vibration Level	1/3-Octave Band	Vibration Impact Criterion	No. of Impacts
Preferred 112th SE Modified Alternative (B2M)	Beginning of Segment B to Bellevue Way SE	163	45	50	16	72	0
	Bellevue Way SE to South Bellevue Park-and-Ride	212	30	35	16	72	0

	Mercer Slough to SE 32nd Street/Henry Bock Road	231	55	43	12.5	72	0
	SE 32nd Street/Henry Bock Road to 118th Street crossing/118th Station	35	55	67	63	72	0

Notes:

Vibration levels are measured in VdB referenced to 1 microinch per second.

The reported vibration level represents the maximum vibration level for each location.

The maximum vibration level reported is for the 1/3-octave band noted.

[a] The vibration impacts for the B3 – 114th Extension Design Option are the same as for Alternative B3.

TABLE 6-15
Segment B Groundborne Noise Impacts

Alternative	Location	Distance To Near Track (feet)	Speed (mph)	Maximum Groundborne Noise Level (dBA)	Impact Criterion (dBA)	No. of Impacts
Preferred 112th SE Modified Alternative (B2M) with *Preferred Alternative C9T* and C9T - East Main Station Design Option	Winters House	18	45	54	40	1
					Total	**1**

Note:

The reported groundborne noise level represents the maximum level for each location.

6.2.3 Segment C

Tables 6-16 and -17 show the estimated vibration velocity and groundborne noise levels for sensitive receptors at representative distances in Segment C. However, for highly sensitive locations, such as hospital and theater locations, additional analyses were required. This analysis follows the standard vibration analysis located in Section 6.2.3.4. Each impacted Category 2 land use area is described by alternative below.

TABLE 6-16
Segment C Vibration Impacts (Does Not Include Highly Sensitive Locations)

Alternative	Location	Connector	Distance to Near Track (feet)	Speed (mph)	Maximum Vibration Level	1/3-Octave Band	Vibration Impact Criterion	No. of Impacts

	Main Street to NE 4th Street	Alternative B3, B3 – Design Option, or B7	39	55	84	63	72	1 hotel
	I-405 Crossing to end of Segment C	Alternative B3, B3 – Design Option, or B7	44	20	73	63	72	1 hotel

Notes: Vibration levels are measured in VdB referenced to 1 microinch per second.

The reported vibration level represents the maximum vibration level for each location.

The maximum vibration level reported is for the 1/3-octave band noted. All reported distances are slant distances from the top of rail for tunnel sections.

Base connect = point between Main Street and NE 2nd Street

[a] The vibration impact at this location is based on the close distance projected from the preliminary alignment location. The alignment location would need to be verified to provide an accurate projection at this location. However, based on testing at the Hilton Hotel, the vibration levels would be much lower than projected.

TABLE 6-17
Segment C Groundborne Noise Impacts (Does Not Include Highly Sensitive Locations)

Alternative	Location	Connector	Distance to Near Track (feet)	Speed (mph)	Maximum Groundborne Noise Level (dBA)	Impact Criterion (dBA)	No. of Impacts

		Alternative B3 or B7	118	20	30	35	0
	6th Street/Bellevue Transit Center to NE 10th Street		92	55	33	35	0
	NE 10th Street to NE 12th Street	All	101	55	32	35	0
	NE 12th Street to 110th Avenue NE	All	40	30	39	35	1 single-family

6.2.3.1 Preferred 108th NE At-Grade Alternative (C11A)

Impacts from *Preferred Alternative C11A* would be due to the proximity of the alternative and to the speed of the light rail vehicles.

Beginning of Segment C to Main Street: A vibration impact is projected at one single-family residence at this location.

112th Avenue NE and Main Street to 108th Avenue NE: A vibration impact is projected at one single-family residence at this location.

108th Avenue NE from Main Street to NE 6th Street: Vibration impact is projected at three multifamily residences along the at this location.

I-405 to the end of Segment C: Vibration impacts are projected at the Coast Bellevue Hotel.

6.2.3.2 Preferred 110th NE Tunnel Alternative (C9T)

Impacts from *Preferred Alternative C9T* would be due to the proximity of the alternative and to the speed of the light rail vehicles.

Beginning of Segment C to Main Street: Vibration impact is projected at six single-family residences at this location. Five of the impacts would be due to the presence of the crossover near Main Street.

112th Avenue NE and Main Street to 110th Avenue NE: A vibration impact is projected at one single-family residence at this location.

I-405 to the end of Segment C: Vibration impacts are projected at the Coast Bellevue Hotel.

Impacts from the C9T – East Main Station Design Option would be due to the proximity of the alternative and to the speed of the light rail vehicles.

Beginning of Segment C to Main Street: A vibration impact is projected at one single-family residence at this location.

112th Avenue NE and Main Street to 110th Avenue NE: A vibration impact is projected at one single-family residence at this location.

I-405 to the end of Segment C: Vibration impacts are projected at the Coast Bellevue Hotel.

6.2.3.3 Bellevue Way Tunnel Alternative (C1T)

Impacts from Alternative C1T would result from its proximity to and the speed of the light rail vehicles.

Beginning of Segment C to Main Street: With Alternative C1T, one single-family residence at this location is projected to have vibration impacts and one with a groundborne noise impact.

I-405 to NE 8th Street: Vibration impacts are projected at the Coast Bellevue Hotel.

6.2.3.4 106th NE Tunnel Alternative (C2T)

Impacts from Alternative C2T would result from its proximity to and the speed of the light rail vehicles. There would be no vibration or groundborne noise impacts from the connector to Alternative B2A, B3, or B7.

Main Street to 106th Avenue NE (connecting to Alternative B2E): Groundborne noise impact is projected at one single-family residence on the south side of Main Street at this location.

6.2.3.5 108th NE Tunnel Alternative (C3T)

Impacts from Alternative C3T would result from its proximity to and the speed of the light rail vehicles.

Beginning of Segment C to 108th Avenue NE (connecting to Alternative B2A): A groundborne noise impact is projected at two single-family residences just south of 110th Avenue SE at this location.

108th Avenue NE to Main Street (connecting to B2A): A groundborne noise impact is projected at nine single-family residences along NE 108th Avenue at this location.

NE 12th Street to 110th Avenue NE: A groundborne noise impact is projected at one single-family residence north of NE 12th Street for all four connectors to Alternative C3T.

112th Avenue NE and Main Street to 108th Avenue NE (connecting Alternative B2E): A groundborne noise impact is projected at one single-family residence on the south side of Main Street at this location.

6.2.3.6 Couplet Alternative (C4A)

Impacts from Alternative C4A would result from its proximity to the buildings along its route.

NE 8th Street to NE 10th Street: A vibration impact is projected at two multifamily buildings along the northbound couplet at this location for all connections to Segment B.

NE 10th Street to 110th Avenue NE and NE 12th Street: A vibration impact is projected at two multifamily residences along the northbound couplet at this location for all connections to Segment B.

NE 12th Street to 110th Avenue NE: A vibration impact is projected at one single-family residence along the northbound couplet for all four alternatives. The impact would be a result of the residence's very close proximity to Alternative C4A.

108th Avenue NE to NE 2nd Street: A vibration impact is projected at two multifamily residences along the southbound couplet at this location for all connections to Segment B.

6.2.3.7 112th NE Elevated Alternative (C7E)

No vibration or groundborne noise impacts are projected for this alternative.

6.2.3.8 110th NE Elevated Alternative (C8E)

The impacts from Alternative C8E would result from its proximity to the Sheraton Hotel and from the speed of the light rail vehicles.

Main Street to NE 2nd Street between 114th Avenue NE and 112th Avenue NE: A vibration impact is projected at the Sheraton Hotel due to its extremely close projected distance from the alternative. The alignment location would need to be further refined to determine the level of impact. Additional testing could also be performed at this location to determine the response of the building foundation; the results of this testing would likely reduce the projected vibration levels. In addition, the building needs to be surveyed to determine the specific locations of vibration-sensitive uses within the structure. Based on testing at the Hilton Hotel, which is a similar building type nearby, the projected vibration levels likely would be significantly lower, depending on the distance from the alignment to the hotel.

NE 2nd Street between 110th Avenue NE and 112th Avenue NE to NE 4th Street: A vibration impact is projected at one multifamily residence at this location.

NE 8th Street to NE 10th Street: A vibration impact is projected at one multifamily residence at this location.

NE 10th Street to NE 12th Street: A vibration impact is projected at one multifamily residence at this location.

NE 12th Street to 112th Avenue NE: A vibration impact is projected at one single-family residence to the north of NE 12th Street at this location.

112th Avenue NE to the end of Segment C: A vibration impact is projected at one single-family residence to the north of NE 12th Street at this location.

6.2.3.9 110th NE At-Grade Alternative (C9A)

The impacts from Alternative C9A would be due to the proximity of the alternative to the hotel and to the speed of the light rail vehicles.

112th Avenue NE and Main Street to 110th Avenue NE: A vibration impact is projected at two single-family residences at this location.

110th Avenue NE from Main Street to NE 6th Street: Vibration impact is projected at three multifamily residences at this location.

I-405 to the end of Segment C: Vibration impacts are projected at the Coast Bellevue Hotel.

6.2.3.10 114th NE Elevated Alternative (C14E)

The impacts from Alternative C14E would result from its proximity to the hotel and from the speed of the light rail vehicles.

Beginning of Segment C to Main Street: Vibration impacts are projected at the Red Lion Hotel.

Main Street to NE 4th Street: Vibration impacts are projected at the Sheraton Hotel.

I-405 crossing to the end of Segment C: Vibration impacts are projected at the Coast Bellevue Hotel.

6.2.3.12 Highly Sensitive Locations Analysis

In addition to sensitive residential land uses, vibration and groundborne noise impacts were assessed for other sensitive locations, including the Bellevue Arts Museum, the theater at Meydenbauer Center, and the Overlake Hospital MRI and Optical Surgery Unit. For this assessment, the museum was treated as an auditorium because quiet is important to the use of a museum (see Table 4-3). In addition, groundborne noise was also assessed for the Bellevue Arts Museum and the theater at Meydenbauer Center. Hospital equipment is not sensitive to groundborne noise. The MRI and optical surgery unit impact levels are based on the criteria for highly sensitive sites (see Section 4.3, Transit Vibration and Groundborne Noise Criteria). The potential for vibration impacts on the new Group Health Bellevue Medical Center was evaluated, but all alternatives would be located at a great enough distance to prevent impacts to sensitive equipment within the facility.

The results presented in Table 6-18 identify no vibration impacts at any of the highly sensitive locations under any of the Segment C alternatives. Table 6-19 shows that a groundborne noise impact is projected at the theater at Meydenbauer Center with *Preferred Alternative C9T* and the C9T – East Main Station Design Option. The groundborne noise impact under this alternative and the design option would be due to the at-grade track in front of the theater. All other alternatives are on elevated guideway structures in front of the theater, which would significantly reduce vibration and groundborne noise levels.

TABLE 6-18
Segment C Vibration Impacts for Highly Sensitive Locations

Location	Alternative	Distance to Near Track (feet)	Speed (mph)	Vibration Level	1/3-Octave Band	Vibration Impact Criterion	No. of Impacts
Bellevue Arts Museum	Bellevue Way Tunnel Alternative (C1T)	65	20	51	N/A	72	0
Meydenbauer Center Theater	*Preferred 108th NE At-Grade Alternative (C11A)*	50	30	55	N/A	72	0
	Preferred 110th NE Tunnel Alternative (C9T)	50	20	65	N/A	72	0
	Bellevue Way Tunnel Alternative (C1T)	50	45	63	N.A	72	0
	106th NE Tunnel Alternative (C2T)	50	45	63	N/A	72	0
	110th NE At-Grade Alternative (C9A)	50	20	55	N/A	72	0
Overlake Hospital MRI	108th NE Tunnel (C3T), Couplet (C4A), 112th NE Elevated (C7E), or 110th NE Elevated (C8E) Alternative	196	20	33	31.5	60	0
Overlake Hospital Optical Surgery Unit	108th NE Tunnel (C3T), Couplet (C4A), 112th NE Elevated (C7E), or 110th NE Elevated (C8E) Alternative	208	20	33	31.5	54	0

Notes:
Vibration levels are measured in VdB referenced to 1 microinch per second.
The reported vibration level represents the maximum vibration level for each location.
The maximum vibration level reported is for the 1/3-octave band noted.

TABLE 6-19
Segment C Groundborne Noise Impacts for Highly Sensitive Locations

Location	Alternative	Distance to Near Track (feet)	Speed (mph)	Groundborne Noise Level (dBA)	Impact Criterion (dBA)	No. of Impacts
Bellevue Arts Museum	Bellevue Way Tunnel Alternative (C1T)	65	20	34	35	0
Meydenbauer Center	*Preferred 108th NE At-Grade Alternative (C11A)*	50	30	26	35	0
	Preferred 110th NE Tunnel Alternative (C9T)	50	20	36	35	1
	110th NE Tunnel Alternative (C9T) - East Main Station Design Option	50	20	36	35	1
	Bellevue Way Tunnel Alternative (C1T)	50	45	27	35	0
	106th NE Tunnel Alternative (C2T)	50	45	27	35	0
	110th NE At-Grade Alternative (C9A)	50	20	26	35	0

Note: The reported groundborne noise level represents the maximum level for each location.

6.2.4 Segment D

Table 6-20 provides the estimated vibration velocity levels for sensitive receptors at representative distances in Segment D. An additional analysis of the potential for vibration impacts on the new Children's Hospital BCSC was conducted and the results are provided in Table 6-21. No impacts were identified from the Segment D alternatives.

6.2.5 Segment E

Table 6-22 provides the estimated vibration velocity levels for sensitive receptors at representative distances in Segment E. Each impacted Category 2 land use area is described by alternative below.

TABLE 6-20
Segment D Vibration Impacts

Alternative	Location	Connector	Distance to Near Track (feet)	Speed (mph)	Maximum Vibration Level	1/3-Octave Band	Vibration Impact Criterion	No. of Impacts
Preferred NE 16th At-Grade Alternative (D2A) [a]	Beginning of Segment D to BNSF Railway line route split	Former BNSF Railway	203	55	53	25	72	0
	Overlake Village Station to Overlake Transit Center Station	All	270	35	53	25	72	0
D2A - NE 24th Design Option	NE 24th Street and 152nd Avenue NE	Former BNSF Railway	151	30	63	31.5	72	0
NE 16th Elevated Alternative (D2E)	Beginning of Segment D to BNSF Railway line route split	BNSF Railway	203	35	55	25	72	0
		NE 12th Street	83	55	51	40	72	0
	Overlake Village Station to Overlake Transit Center Station	All	270	35	53	25	72	0
NE 20th Alternative (D3)	Beginning of Segment D to BNSF Railway line route split	BNSF Railway	203	55	53	25	72	0
		NE 12th Street	83	45	55	31.5	72	0
	136th Place NE and NE 20th Street to 140th Avenue NE	All	158	35	57	25	72	0
	148th Avenue NE to 152nd Avenue NE	All	40	20	65	40	72	0
	152nd Avenue NE to NE 24th Street	All	182	35	56	25	72	0
	NE 24th Street to SR 520	All	219	35	55	25	72	0
SR 520 Alternative (D5)	Beginning of Segment D to BNSF Railway line route split	BNSF Railway	145	55	55	25	72	0
		NE 12th Street	125	55	56	25	72	0
	124th Avenue NE to 130th Avenue NE	All	33	50	66	31.5	72	0
	NE 24th Street and 152nd Avenue NE to SR 520	All	234	35	54	25	72	0

Notes:
Vibration levels are measured in VdB referenced to 1 microinch per second.
The reported vibration level represents the maximum vibration level for each location.
The maximum vibration level reported is for the 1/3-octave band noted.
[a] The vibration impacts for the D2A – 120th Station Design Option are the same as for *Preferred Alternative D2A*.

TABLE 6-21
Segment D Vibration Impacts for Highly Sensitive Locations

Location	Alternative	Distance to Near Track (feet)	Speed (mph)	Vibration Level	1/3-Octave Band	Vibration Impact Criterion	No. of Impacts
Children's Hospital	*Preferred NE 16th At-Grade Alternative (D2A)*	600	55	49	80	60	0
	NE 16th Elevated Alternative (D2E)	160	55	41	80	60	0
	NE 20th Alternative (D3)	160	55	51	80	60	0
	SR 520 Alternative (D5)	300	55	49	80	60	0

Notes:

Vibration levels are measured in VdB referenced to 1 microinch per second.

The reported vibration level represents the maximum vibration level for each location.

The maximum vibration level reported is for the 1/3-octave band noted.

TABLE 6-22
Segment E Vibration Impacts

Alternative	Location	Distance to Near Track (feet)	Speed (mph)	Maximum Vibration Level	1/3-Octave Band	Vibration Impact Criterion	No. of Impacts
Preferred Marymoor Alternative (E2) [a]	NE 51st Street to NE 60th Street	37	55	77	63	72	1 single-family
	NE 60th Street to West Lake Sammamish Parkway	28	55	82	40	72	2 single-family
	166th Avenue NE to Leary Way	78	55	54	63	72	0
	Leary Way to 162nd Avenue NE	73	55	56	63	72	0
Redmond Way Alternative (E1)	NE 51st Street to NE 60th Street	37	55	77	63	72	1 single-family
	NE 60th Street to West Lake Sammamish Parkway	31	55	80	40	72	2 single-family
	West Lake Sammamish Parkway to 154th Avenue NE	21	25	65	63	72	0
	154th Avenue NE to BNSF Railway corridor	286	25	30	20	72	0
	BNSF Railway corridor to Leary Way	252	55	48	12.5	72	0
	Leary Way to 166th Avenue NE	73	55	56	63	72	0
	SR 520 to NE 70th Street	76	20	42	63	72	0
Leary Way Alternative (E4)	NE 51st Street to NE 60th Street	37	55	77	63	72	1 single-family
	NE 60th Street to West Lake Sammamish Parkway	57	55	72	63	72	0
	West Lake Sammamish Parkway to NE Leary Way	209	25	31	20	72	0
	NE Leary Way to NE 76th Street	5	55	96	63	72	1 multifamily, 1 hotel
	SR5 20 to NE 70th Street	76	20	52	63	72	0

Notes:

Vibration levels are measured in VdB referenced to 1 microinch per second.

The reported vibration level represents the maximum vibration level for each location.

The maximum vibration level reported is for the 1/3-octave band noted.

[a] The vibration impacts for the E2 - Redmond Transit Center Design Option would not differ from those under *Preferred Alternative E2*.

6.2.5.1 Preferred Marymoor Alternative (E2)

The impacts from *Preferred Alternative E2* would be a result of the speed of the light rail vehicles.

NE 51st Street to NE 60th Street: One single-family residence at this location, just to the south of NE 60th Street, would have a projected vibration impact.

NE 60th Street to West Lake Sammamish Parkway: Vibration impacts are projected at two single-family residences located in the residential community just before the alternative crosses SR 520.

The impacts from the E2 - Redmond Transit Center Design Option are the same as for *Preferred Alternative E2*.

6.2.5.2 Redmond Way Alternative (E1)

The impacts from Alternative E1 would result from the speed of the light rail vehicles.

NE 51st Street to NE 60th Street: One single-family residence at this location, located just to the south of NE 60th Street, would have a vibration impact.

NE 60th Street to West Lake Sammamish Parkway: There would be impacts on two single-family residences in the residential community at this location, just before the alternative crosses SR 520.

6.2.5.3 Leary Way Alternative (E4)

The impacts from Alternative E4 would be a result of its proximity to the Residence Inn Hotel and of the speed of the light rail vehicles.

NE 51st Street to NE 60th Street: One single-family residence at this location, located just to the south of NE 60th Street, would have a vibration impact.

NE Leary Way to NE 76th Street: There are two projected impacts at this location. One would be at the Residence Inn Hotel at the Redmond Town Center, which is within 5 feet of the alternative, and the other would be on the south side of NE Leary Way, where a multifamily building is located within 20 feet of the alternative.

6.2.6 Maintenance Facility Alternatives

No vibration impacts are projected to occur from operation and maintenance activities.

6.3 Construction Noise Assessment

Several construction phases would be required to complete the East Link Project. The analysis assumes the worst-case noise levels based on three major types of construction described below and shown in Table 6-23. The actual noise levels experienced during construction would generally be lower than those given in this report. The noise levels presented here are for periods of maximum construction activity and would occur for a limited period of time.

TABLE 6-23
Noise Levels for Typical Construction Phases[a]

Scenario[b]	Equipment[c]	Lm[d]	Leq[e]
Utilities preparation and relocation	Air compressors, backhoe, concrete pumps, crane, excavator, forklifts, haul trucks, loader, pumps, power plants, service trucks, tractor trailers, utility trucks, vibratory equipment	94	87
Structures construction, track installation, and paving activities	Air compressors, backhoe, cement mixers, concrete pumps, crane, forklifts, haul trucks, loader, pavers, pumps, power plants, service trucks, tractor trailers, utility trucks, vibratory equipment, welders	94	88
Miscellaneous activities	Air compressors, backhoe, crane, forklifts, haul trucks, loader, pumps, service trucks, tractor trailers, utility trucks, welders	91	83

[a] Combined worst-case noise levels for all equipment at a distance of 50 feet from work site.

[b] Operational conditions under which the noise levels are projected.

[c] Normal equipment in operation under the given scenario.

[d] Lm (dBA) is an average maximum noise emission for the construction equipment under the given scenario; for this type of equipment and activities, the Lm is slightly less than the Lmax.

[e] Leq (dBA) is an energy average noise emission for construction equipment operating under the given scenario.

6.3.1 Demolition, Site Preparation, and Utilities Relocation

Major noise-producing equipment used during the construction preparation stage could include saw cutters, concrete pumps, cranes, excavator, haul trucks, loader, tractor-trailers, and vibratory equipment. Maximum noise levels could reach 82 to 86 dBA at the nearest residences (i.e., within 50 to 100 feet) for normal construction activities during this phase. Other, less notable noise-producing equipment expected during this phase includes backhoes, air compressors, forklifts, pumps, power plants, service trucks, and utility trucks.

6.3.2 Structures Construction, Track Installation, and Paving Activities

The loudest noise sources in use during construction of elevated structures would include cement mixers, concrete pumps, cranes, pavers, haul trucks, and tractor-trailers. The cement mixers, cranes, and concrete pumps would be required for construction of the light rail superstructure. The pavers and haul trucks would be used to provide the final surface on the roadway. Maximum noise levels would range from 82 to 94 dBA at the closest receiver locations.

6.3.3 Miscellaneous Activities

Following the heavy construction, general construction such as installation of bridge railing, signage, roadway striping, communication and power systems, and other general activities would still need to occur. These less intensive activities are not expected to produce noise levels above 80 dBA at 50 feet except during rare occasions, and even then only for short periods of time. Using the information in Table 6-23, typical construction noise levels were projected for several distances from the project work area. Exhibit 6-1 is a graph of general construction noise level versus distance for project phases of construction.

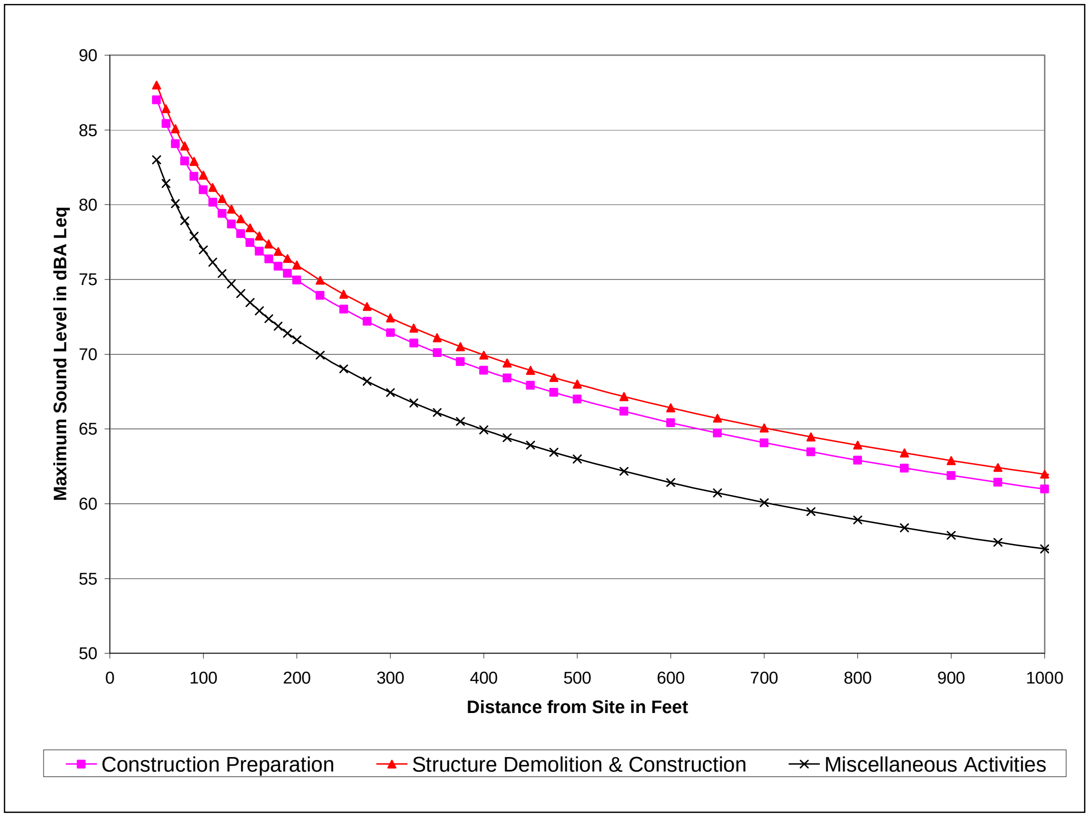

EXHIBIT 6-1
Maximum Noise Level Versus Distance for Typical Construction Phases

6.3.4 Pile-Driving

Pile-driving would likely be required to support permanent structures such as piers for elevated structures and cut-and-cover tunnel walls. Pile-driving can produce maximum short-term noise levels of 99 to 105 dBA at 50 feet. Actual levels can vary and would depend on the distance and topographical conditions between the pile-driving location and the receiver location. Exhibit 6-2 is a graph of maximum pile-driving noise levels versus distance.

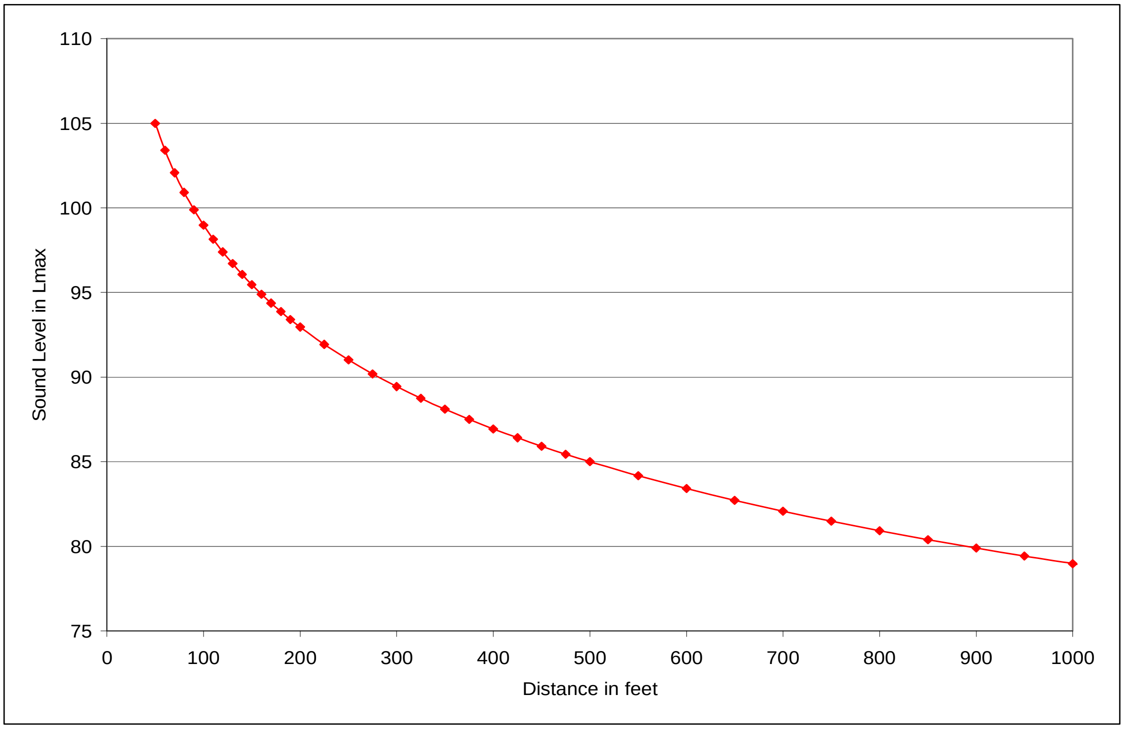

EXHIBIT 6-2
Pile-Driving Noise Level Versus Distance

6.3.5 Nighttime Construction Activities

Some construction activities might be required during nighttime hours because of the nature of the construction or to avoid daytime traffic impacts or impacts to some adjacent land uses. In order to perform construction at night, a noise variance from the local governing agency would be required. When a final alternative is selected, Sound Transit would work with the local governments and agencies to provide a construction plan that would allow the project to be constructed cost-effectively with minimal disruption to local areas and traffic flow. If nighttime construction is deemed necessary, then Sound Transit would work with each governing agency to obtain any necessary noise variance specific to project construction.

6.3.6 Segment A Construction Noise

Because much of the light rail alternative in Segment A would be in commercial and industrial areas or in the I-90 highway corridor, many noise-sensitive areas would be shielded from much of the construction noise sources.

Construction in the I-90 corridor, west of the Mount Baker Tunnel, would result in increased noise levels at the residential areas along Sturgus Avenue South and south of I-90 near the tunnel portal. Maximum noise levels from construction at these homes should not exceed 75 to 78 dBA under any phase of construction. Maximum construction noise levels at residential locations on the east end of the Mount Baker Tunnel, near 35th Avenue South, are projected to reach up to 85 dBA Lmax during brief periods of heavy construction. Typical construction noise during daytime hours would be approximately the same as the existing traffic noise levels in this area.

On Mercer Island, most of the *Preferred Alternative A1* route would be in a deep, retained cut with I-90, and the construction sites would be well shielded from noise-sensitive land uses. Residences located near the connection to the I-90 floating bridge and the East Channel bridge would likely notice an increase in noise from construction activities for short periods of time. There would also be construction activities for the station platforms and access; however, station construction would likely be during the daytime and would meet the local noise ordinance.

6.3.7 Segment B Construction Noise

There are a large number of single-family and multifamily residences along the Segment B alternatives. Under the Bellevue Way alternatives (i.e., *Preferred Alternative B2M* and Alternatives B1, B2A, B2E, and B3 and B3 – 114th Extension Design Option), noise levels at adjacent residences would have short periods of time with maximum noise levels exceeding 80 dBA Lmax. Major construction noise would occur when relocating utilities, installing retaining walls (where required), repaving Bellevue Way, and constructing the Alternative B2E, B3, or B3 – 114th Extension Design Option elevated guideway structures. Pile-driving and sheet-pile installation might also be required. Pile-driving could produce Lmax noise levels of 105 dBA at 50 feet. Although there would be periods of relatively loud construction, noise levels would decrease as tasks are completed and construction activities move to other areas.

Under Alternative B1, the impacts and noise levels described above would continue to the tunnel portal in Segment C. Alternatives B2A, B2E, B3, and B3 – 114th Extension Design Option would be located on 112th Avenue SE, where residences in some areas are set back farther from the construction sites than they are on Bellevue Way. Therefore, noise levels on 112th Avenue SE would have a lower impact. The highest noise levels would occur when relocating utilities, repaving, and constructing the Alternatives B2E, B3, and B3 – 114th Extension Design Option elevated guideway structures.

Under Alternative B7, noise levels at the multifamily apartments and condominiums adjacent to the alternative in the former BNSF Railway corridor could reach 80 dBA Lmax for short periods. Because this alternative would not be on a major roadway, it would be less likely that nighttime work would be required near the noise-sensitive units. Pile-driving might also be required under this alternative along the I-90 corridor to SE 32nd Street. Noise from the pile-driver could exceed 85 dBA Lmax at the nearby multifamily residences south of SE 32nd Street. The pile-driving would also increase noise levels in the southern section of the Mercer Slough Nature Park. Worst-case noise levels of up to 100 dBA Lmax can be expected within 100 feet of the construction site, as shown on Exhibit 6-2.

There are also several commercial structures that would be affected by construction noise in Segment B. Businesses located along Bellevue Way SE would have short periods of time with maximum noise levels exceeding 80 dBA Lmax under Alternative B1. The business parks located south of 112th Avenue SE would also experience elevated noise levels under Alternatives B2A, B2E, B3, and B3 – 114th Extension Design Option. Alternative B7 would also increase noise at some commercial structures; however, traffic noise from I-405 would remain a significant noise source at commercial structures along this alternative.

6.3.8 Segment C Construction Noise

Construction in downtown areas is often difficult due to high traffic volumes and general congestion. Major noise sources would include haul truck traffic to and from tunnel-staging areas, pile-driving for elevated structures, cement-pumping trucks, and cement delivery trucks. Major noise-producing activities would include utilities relocation, repaving project roadways, and construction of elevated structures. The projected construction noise levels are typical for transportation construction projects, such as roadway paving projects. The main differences between a typical paving operation and the tunnel construction are the length of time to complete the project and the level of haul truck activity.

Noise levels at residences near tunnel portals, at-grade alignments, and staging areas on Bellevue Way, 112th Avenue SE, Main Street along NE 6th Street and on 110th Avenue NE between NE 3rd Street and NE 2nd Place could exceed 80 dBA Lmax during heavy construction periods for all alternatives. Typical daytime noise levels from the staging areas are projected to be 73 to 84 dBA, depending on the level and type of activity at the time. Maximum noise levels of over 80 dBA Lmax could still occur in locations where the homes are directly on 112th Avenue SE, such as for the single-family and multifamily homes between SE 6th Street and Main Street, for all alternatives except C1T. Noise levels would also exceed 80 dBA Lmax along the residential area on 110th Avenue NE for *Preferred Alternative C11A* or *C9T*, C9T – East Main Station Design Option, and Alternatives C3T, C4A, and C8E. Alternatives C3T, C4A, and C8E would also result in noise levels exceeding 80 dBA Lmax at the single-family residences north of NE 12th Street. Noise levels at the residential area on Lake Bellevue are not projected to exceed 80 dBA Lmax, except during pile-driving, structure construction, or utilities relocations.

Noise levels near the tunnel portal and staging areas along Main Street are also projected to range from 73 to 84 dBA Lmax at 50 feet from the site. Construction noise levels at residences in the Surrey Downs neighborhood would vary and depend on how close the residence is to the site and the level of shielding the residence has from existing homes. The highest levels would be at residences directly adjacent to the construction site. Similar construction noise levels are also projected for the tunnel portal and staging areas near McCormick Park under

Alternatives C3T, C4A, and C8E. Constructing the elevated structure under Alternative C7E would also result in construction noise at residential and commercial land uses along 112th Avenue NE.

Alternatives C3T, C4A, C7E, and C8E would require construction along NE 12th Street near the Overlake Medical Center, the Children's Hospital BCSC, and nearby supporting offices. Maximum noise levels at the hospital are projected to reach up to 82 dBA Lmax, with typical noise levels ranging from 71 to 75 dBA. The parking structure at both hospitals is expected to act as a sound wall and provide some noise reduction from construction activities. Construction noise through Downtown Bellevue under the two at-grade alternatives (Alternatives C4A and C9A) would be similar to those described for *Preferred Alternative C11A*, although Alternative C4A noise would occur along 108th and 110th Avenues NE, and Alternative C9A noise would occur along 110th Avenue NE.

Commercial land uses in Segment C would also experience elevated noise levels during construction. With Alternatives C1T and C2T, elevated noise levels would be experienced along the entire corridor due to cut-and-cover construction methods. With Alternative C3T, which would use bored tunneling construction methods, most construction-related noise would be at the portals and the Bellevue Transit Center Station. Alternative C4A would require heavy at-grade construction along 108th and 110th Avenues NE, including relocating utilities, installing track, and paving. Maximum levels could exceed 80 dBA Lmax during periods of heavy construction. Alternatives C7E and C8E are both elevated and would install the elevated structure along 110th Avenue NE (C8E) or 112th Avenue NE (C7E), resulting in maximum levels of 80 to 85 dBA at 50 feet from the project work site.

6.3.9 Segment D Construction Noise

Segment D has a limited number of residential land uses that would be affected by East Link Project construction noise. There would be an increase in noise at the residential area on Lake Bellevue when connecting to Alternative C1T or C2T. Construction noise would also affect the multifamily building on NE 21st Place, just south of SR 520, and the Children's Hospital BCSC on 116th Avenue NE.

The former Group Health Eastside Hospital Campus is currently being redeveloped to mixed residential commercial land use. Constructing *Preferred Alternative D2A* or Alternative D2E or D3 would have the highest impact on the new mixed-use development planned for this site, due to the proximity of these alternatives. Maximum noise levels are projected to reach up to 82 dBA Lmax, with typical noise levels ranging from 69 to 78 dBA. Commercial and retail land uses along the proposed corridors would also experience maximum levels of 80 to 85 dBA at 50 feet from the project work site during periods of heavy construction.

6.3.10 Segment E Construction Noise

Removing and replacing existing sound walls adjacent to SR 520 could be required from the beginning of Segment E to West Lake Sammamish Parkway. During wall replacement, noise levels at the residences would increase not only from construction noise but also from traffic noise on SR 520. During heavy periods of construction, noise levels could reach 85 dBA Lmax, with typical hourly average noise levels ranging from 70 to 80 dBA. When the sound walls are replaced, work on the light rail construction would be mostly shielded by the walls, and noise levels should not exceed 60 to 70 dBA.

Constructing the elevated portion of Alternative E4 near the Redmond Town Center would result in noise-level increases at the multifamily units along Leary Way. Maximum noise levels are projected to range from 80 to 85 dBA Lmax during the heaviest construction periods. Pile-driving might also be required for the elevated structures, which could result in peak noise levels exceeding 100 dBA. Construction of the at-grade portions of all alternatives through Downtown Redmond would increase noise levels during utilities relocations, paving, and track installation, with maximum noise levels of 80 to 85 dBA Lmax. Construction noise levels in Marymoor Park are projected to reach 80 to 85 dBA Lmax during heavy construction for *Preferred Alternative E2* and E2 – Redmond Transit Center Design Option. Pile-driving might be required for the Sammamish River crossing, which could result in peak noise levels exceeding 100 dBA.

6.3.11 Maintenance Facility and Park-and-Ride Lot Construction Noise

Except for the 116th Maintenance Facility (MF1), the maintenance facility alternatives are not near residential land uses that would be affected by construction noise. Some residences are present on the west side of 116th Avenue NE, near MF1, and the Children's Hospital BCSC is just south of the site. Construction of the maintenance bases and park-and-ride lots is projected to produce maximum noise levels of 75 to 85 dBA Lmax at 50 feet during periods of heavy construction. The loudest noise sources would include cement mixers, concrete pumps, cranes, and haul trucks. Cement mixers, cranes, and concrete pumps would be required for construction of multistory parking facilities and maintenance buildings. For surface lots and station construction, the loudest construction noise sources are pavers and haul trucks that would be used to apply the asphalt and construct access roads. Other, less notable noise-producing equipment would include backhoes, air compressors, forklifts, pumps, power plants, service trucks, and utility trucks.

6.4 Construction Vibration Assessment

Based on the damage criteria described in Section 4.5, the only activity likely to cause vibration damage would be impact pile-driving at locations within 25 feet of structures. However, many of the alternatives would require impact pile-driving. The Coast Bellevue Hotel is the only structure within 25 feet of *Preferred Alternative C9T* and Alternative C9A. If pile driving were performed at this location, there would be the potential for damage. The locations of where there would be piles will not be available until final design for the project, but they would likely be at elevated structures or retained cuts approaching tunnels. As specific locations of piles are developed, more analysis should be conducted. To prevent damage, care should be taken to avoid pile-driving too close to buildings.

Constructing a retained cut near the Winters House, including construction of underground piles to structurally support the cut, could result in vibration impacts. Because of the property’s age and type, damage to the building could occur without construction vibration-minimization techniques. The criteria for damage for this type of structure are 94 VdB or 0.2 peak particle velocity (PPV); construction vibration is projected to be 0.2 PPV. Using the techniques and construction methods described in Section 7.7 below as mitigation would prevent vibration damage or limit damage to minor cosmetic damage.

To assess the potential for temporary, short-term construction vibration impacts, construction vibration levels were projected for tunnel construction operations in Segment C and for piling and vibratory rolling along the entire corridor. Reference vibration levels have been collected from other environmental vibration studies. Data for tunnel-boring machines include tunneling in rock and in soil. However, based on the geotechnical investigations to date, the East Link Project would not require tunneling in rock. Table 6-24 shows the reference vibration levels for these sources at 25 feet.

TABLE 6-24
Vibration Levels for Construction Equipment

Construction Equipment	Maximum Lv at 25 feet (VdB)
Tunnel-boring machine (in rock)	85
Tunnel-boring machine (in soil)	69
Muck trains	72
Vibratory roller	94
Impact pile-driving	112

Vibration levels are projected on the ground floors inside buildings. This assumes no coupling attenuation (i.e., reduction in vibration level due to the foundation) for single-family residences, a 10-dB building coupling attenuation for large masonry buildings, and no floor-to-floor attenuation. Table 6-25 shows the distances at which groundborne vibration impacts would occur for single-family residences and large masonry buildings for each piece of construction equipment. These distances correspond to vibration in any 1/3-octave band between 8 and 80 Hz that exceeds the criterion (see Section 4.3).

The results of this analysis show that temporary, short-term vibration impact would not be an issue for tunnel construction. As discussed in Section 4.5, criteria levels for impacts to buildings range from 94 VdB for nonengineered timber and masonry buildings to 102 VdB for reinforced concrete, steel, or timber buildings. The maximum VdBs provided in Table 6-24 are at or below the lowest impact criteria level. The only likely source of construction vibration annoyance would be pile-driving. If alternative methods of pile-driving can be employed, then the distance to vibration impact can be greatly reduced.

TABLE 6-25
Distances from Sources to Groundborne Vibration Impact

Construction Equipment	Distance to Groundborne Vibration Impact (feet)
Tunnel-boring machine in rock (large masonry buildings)	17
Tunnel-boring machine in rock (single-family residences)	36
Tunnel-boring machine in soil (large masonry buildings)	6
Tunnel-boring machine in soil (single-family residences)	13
Muck trains (large masonry buildings)	8
Muck trains (single-family residences)	16
Vibratory roller (large masonry buildings)	18
Vibratory roller (single-family residences)	36
Impact pile-driving (large masonry buildings)	70
Impact Pile-driving (single-family residences)	150

Table 6-26 shows the range of distances from various sources to the threshold for groundborne noise impact for both single-family residences and large masonry buildings. The groundborne noise impact criterion is 40 dBA, based on frequent events for Category 3 land uses (see Table 4-2 in Section 4.3). These results show that groundborne noise impact could result from muck-train activities; however, this would depend on the depth of the tunnel at any particular location. It is important to note that these are temporary impacts, and the annoyance from these activities would be limited in duration. For most activities, including tunneling, the duration would be a few days to a few weeks for each activity. The only activity with a longer duration would be using muck trains near the tunnel portals, which could be required for between 1 month and 18 months, depending on the tunnel alternative chosen and the speed of tunneling.

TABLE 6-26
Distances from Sources to Groundborne Noise Impact

Construction Equipment	Distance to Groundborne Noise Impact (feet)
Tunnel-boring machine in soil (large masonry buildings)	7
Tunnel-boring machine in soil (single-family residences)	14
Muck trains (large masonry buildings)	24
Muck trains (single-family residences)	51

7.0 Potential Mitigation of Noise and Vibration Impacts

Sound Transit has developed and adopted the Sound Transit Noise Mitigation Policy, Motion M2004-08 (Sound Transit Policy, 2004). This policy (Sound Transit Policy, 2004), was designed to provide guidance on the analysis and mitigation of noise impact associated with Link light rail projects. The following policies shall guide Sound Transit's assessment and control of potential Link noise impacts:

A. Sound Transit shall comply with applicable federal, state, and local noise requirements in evaluating noise impacts, determining appropriate mitigation measures, and implementing Link projects.

B. Sound Transit will seek to identify potential noise impacts and potential mitigation measures early in the project development process, as practicable.

C. Sound Transit will seek to reduce expected noise impacts, as practicable, through reductions in source emissions and project design.

D. Sound Transit will seek to work with local jurisdictions to provide that development that occurs is compatible with expected or existing project operational noise.

It is also important to note that during final design, all impacts and mitigation measures will be reviewed to verify projections. If, at that time, it is discovered that mitigation can be achieved by a less costly means through more detailed testing, or that the noise impact at the location would not occur even without mitigation, then the mitigation measure may be eliminated.

7.1 Potential Light Rail Noise Mitigation Options

One of the most effective forms of noise mitigation is to attempt to reduce noise at the source. Source noise reduction is normally accomplished through vehicle specifications. Sound Transit has purchased state-of-the-art, low-noise vehicles equipped with noise-reducing wheel skirts covering the wheel-rail interface. Several additional operational measures can also be used to reduce noise levels at the source. Table 7-1 lists operational and maintenance measures that Sound Transit would perform on a regular basis and the benefit that each measure would provide.

TABLE 7-1
Systemwide Light Rail Operational Mitigation

Operational Measure	System Benefit
Rail grinding and replacement	As rails wear, both noise and vibration levels from light rail operations can increase. By grinding or replacing worn rails, noise and vibration levels will remain at the projected levels. Rail grinding or replacement is normally performed every 3 to 5 years.
Wheel truing and replacement	Wheel truing is a method of grinding down flat spots (commonly called "wheel flats") on the vehicle wheels. Flat spots occur primarily because of hard braking. When flat spots occur they can cause increases in both the noise and vibration levels produced by the light rail vehicles.
Vehicle maintenance	Vehicle maintenance includes performing scheduled and general maintenance on items such as air conditioning units, bearings, wheel skirts, and other mechanical units on the light rail vehicles. Keeping the mechanical systems on the light rail vehicles in top condition will also help to maintain the projected levels of noise and vibration.
Operator training	Operators will be trained to operate light rail vehicles at the speeds given in the operation plan that was used for the analysis and to avoid "hard-braking," which can cause wheel flats and may also damage the track. Furthermore, by training operators to identify potential wheel flats and other mechanical problems with the trains, proper maintenance can be performed in a more timely manner.

For locations where potential noise impacts have been identified, mitigation measures would be considered and reviewed using Sound Transit's Mitigation Policy (Sound Transit Policy, 2004). Under the Sound Transit Mitigation Policy, mitigation measures would be considered for all noise impacts. As described above, source treatments that Sound Transit is currently using to minimize noise impacts include requiring wheel skirts, maintaining smooth tracks, vehicle maintenance and wheel truing, and operator training.

For any noise impacts predicted using the baseline information on light rail operations, the next type of mitigation considered would be applied between the noise source and receiver. Typical path mitigation includes sound walls, earth berms, and buffer zones. Constructing sound walls between the light rail tracks and the affected receivers would reduce noise levels by physically blocking the transmission of noise generated by light rail. Barriers can be constructed as walls or earthen berms. Earthen berms require more right-of-way than walls and are usually constructed with a 3-to-1 slope. For the East Link Project, berms would not generally be feasible due to topographical conditions and limited right-of-way. For at-grade or elevated guideway structures, sound walls should be high enough to break the line of sight between the noise source and the receiver. Typical height for at-grade sound walls is 6 to 8 feet and 4 to 6 feet when on elevated structures. Sound walls must also be long enough to prevent flanking of noise around the ends of the walls. Openings in sound walls for driveway connections or intersecting streets greatly reduce the effectiveness of these walls.

Buffer zones are undeveloped, open spaces between the noise source and receiver. Buffer zones are created when an agency purchases land or development rights in addition to the normal right-of-way, so that future dwellings cannot be constructed close to the noise source. This prevents the possibility of constructing dwellings that would otherwise experience an excessive noise levels. However, because the East Link Project is in an urban setting where land is at a premium, creating buffer zones is not a feasible form of noise mitigation.

For situations where path mitigation is either not feasible or ineffective, building sound insulation would be considered. Sound insulation programs are developed to make sure that the interior noise levels in sleeping and living quarters in residential land uses or in noise-sensitive areas of schools and other institutional uses remain within the guidelines set by the Department of Housing and Urban Development (HUD). Under these guidelines, noise levels in sensitive areas of residential land uses should not exceed 45 dBA Ldn and some form of fresh air exchange must be maintained. The air exchange can be achieved by opening a window or using some form of ventilation system. Sound insulation is normally only used on older dwellings with single-pane windows, or in buildings with double-pane windows that are no longer effective due to leakage. Sound insulation would not reduce exterior noise levels.

Finally, when a light rail vehicle travels over a crossover, there is a loud clicking noise as the steel wheels go over the gap between the tracks. This can increase noise levels from the train by as much as 10 dBA compared to a smooth track with no gaps. Mitigation for noise impacts from crossover tracks can include relocating the crossover away from noise-sensitive properties, or the use of special trackwork, such as special frogs that include gap-closing mechanisms, or using movable point frogs. A "frog" in this context is a rail-crossing structure at track crossovers, which allows the train to cross over to another track or continue moving on the same track. A gap is provided on top of the frog so that vehicle wheels can pass regardless of which track is in use. With standard rigid frogs, vibration occurs when the wheels pass over the gap, but a moveable point frog eliminates the gap and one end of the frog moves in the direction of train travel. Other similar options are spring-rail or flange-bearing frogs.

The FTA considers impacts in the severe category as those requiring the most thorough noise mitigation consideration if the project cannot avoid the impact. Sound Transit is committed to reducing or eliminating severe impacts. For impacts in the moderate category, the FTA provides more leeway regarding required mitigation, and several factors can be considered, such as the existing noise levels, existing and future land use, and the severity of the moderate impact. Finally, any proposed noise mitigation measure must be considered reasonable and feasible to be included with the project. Feasibility includes two main factors: the overall noise-reduction of the mitigation and its constructibility. The reasonability criteria of noise mitigation are related to the cost and noise-reduction of the proposed mitigation. Other items that may be considered include community input, land use, whether the impact occurs on a ground floor or upper floor, and safety.

Although the mitigation measures presented above provide for reduced noise levels from all forms of light rail operation, including audible warning devices such as train-mounted horns and bells at crossing gates, Sound Transit is currently evaluating additional methods to assist in reducing noise from audible warning devices. For example, Sound Transit recently modified their train-mounted bell policy. Under the new policy, train-mounted bells would be sounded two to three times as a train approaches and passes through an at-grade crossing, producing maximum levels of 80 dBA Lmax at 50 feet between 6:00 a.m. and 10:00 p.m. and reducing to 72 dBA Lmax between 10:00 p.m. and 6:00 a.m. This is a reduction of 5 dBA Lmax during the daytime and a reduction of 13 dBA between 10:00 p.m. and 6:00 a.m. when compared to the initial bell policy. This change reduces the overall bell noise levels and reduces bell noise levels even further during hours when the bells could have the most negative impact on nearby residential uses.

Sound Transit is also evaluating the use of reduced noise levels from the warning bells used for gated at-grade crossings. For this analysis, the gate bells were analyzed using the default methods from the FTA Manual (2006), which assumes a typical Lmax of 85 to 86 dBA at 10 feet (single event level [SEL] of 109 dBA at 50 feet), 360 degree directional sound output, and that the bells would sound for approximately 25 seconds per train (10 to 13 seconds while raising gates and 10 to 13 seconds when lowering gates). Sound Transit is considering the use of lower bell noise levels. Depending on the location of the gates and background ambient noise levels, gate warning bells noise levels could be reduced by up to 10 dBA Lmax (from 85 dBA to 75 dBA). Sound Transit is also considering the use of bell shrouds, which are mechanical devices used to modify bells and direct the sound from the bells at the traffic and pedestrian areas of concern. The shrouds thereby reduce bell-related noise to the sides, where there are often noise-sensitive properties. Because these bell noise mitigation measures are still under investigation, they were not assumed in the noise projections; therefore, the gated bells analysis used in this environmental document is a worst-case projection of operational noise levels. These methods of further reducing noise from system operations are being reviewed. If they are found to be effective at reducing noise, while not jeopardizing operational safety, these methods could be included in the project during final design. It is important to note that operational safety is of the utmost importance and cannot be jeopardized.

7.2 Potential Traffic Noise Mitigation Options

For locations with traffic-noise impacts caused by the East Link Project, Sound Transit may consider sound insulation if no other form of mitigation is found to be reasonable and effective at reducing the noise impact. Use of FHWA or WSDOT funds for sound insulation of residences for traffic noise abatement is allowed only in specific situations. WSDOT and FHWA policies and procedures, and 23 CFR 772.13(c)(6), limit sound insulation for traffic-noise abatement to public use or nonprofit institutional structures and only in situations where a barrier is ineffective, unreasonable, and/or infeasible and interior noise levels are above the impact criteria. Sound insulation of residences is allowed only when noise impacts are severe (i.e., above 80 dBA exterior or above 60 dBA interior) and no other type of abatement is possible. In contrast, Sound Transit considers residential sound insulation for any noise impacts related to light rail projects if a barrier is ineffective, unreasonable, and/or infeasible, including impacts from traffic caused by road realignment or additional lanes constructed during light rail construction. The mitigation proposed follows Sound Transit policy.

Several different traffic-noise abatement measures are evaluated whenever noise impacts are expected. These include traffic management measures, highway design measures, and sound walls such as earthen berms. Other mitigation measures, such as property acquisition, were not considered for the East Link Project. Specific mitigation measures recommended as part of the project must be feasible and reasonable. Possible mitigation measures are provided below.

7.2.1 Traffic Management Measures

Traffic management measures include modification of speed limits and restricting or prohibiting truck traffic. Restricting truck use on the project roadways would reduce noise levels at nearby receivers because trucks are louder than cars. However, displacing truck traffic from one roadway to another would only shift noise impacts from one area to another and conflict with the project objective.

7.2.2 Highway Design Measures

Highway design measures include altering the roadway alignment and depressing roadways in cut sections. Alteration of a roadway alignment could decrease noise levels by moving the noise source farther away from the affected receivers. Topographical and built-environment considerations determine the proposed project profile. There are no opportunities on the East Link Project for highway design options that could be used to provide noise mitigation.

7.2.3 Sound Walls

Construction of sound walls between the roadways and the affected receivers would reduce noise levels by physically blocking the transmission of traffic-generated noise. Barriers can be constructed as walls or earthen berms. Earthen berms require more right-of-way than walls and are usually constructed with a 3-to-1 slope. For the East Link Project, berms would generally not be feasible because of the right-of-way requirements.

Sound walls should be high enough to break the line-of-sight between the noise source and the receiver. They must also be long enough to prevent substantial flanking of noise around the ends of the walls. For a sound wall to be considered feasible, 60 percent of the first-row receivers must have a minimum 5-dB noise reduction and at least one receiver must have a 7-dB reduction. Openings in the sound walls for driveways and walkways can considerably reduce the barrier effectiveness.

The relationship of the location of a sound wall to the receptors to be protected would be considered in making a reasonableness determination. Very tall barriers located close to the receptors can have a negative visual impact.

For locations where there is a potential for traffic noise to reflect off the sound walls, Sound Transit would propose to use absorptive treatments to remedy this issue.

7.3 Potential Noise Mitigation Measures

This section provides general details on the potential noise mitigation measures that would be used for the different alternatives. The noise mitigation commitments herein are firm commitments to meet the FTA and FHWA noise criterion applicable at each location. However, if during final design Sound Transit determines that the relevant noise criterion can be achieved by a less costly means, or that the noise impact at that location would not occur even without mitigation, then the mitigation measure might be eliminated or modified as needed. Conversely, if any additional noise impacts are identified during final design, then Sound Transit would make every attempt to provide mitigation that is consistent with the Sound Transit Policy (2004).

Appendix E provides complete details on mitigation, including projected noise levels with the proposed noise mitigation measures for each receiver. Alternative specific mitigation measures are presented below, and Table 7-2 provides a complete summary of mitigation measures.

TABLE 7-2
Summary of Potential Noise Impacts and Mitigation Measures

Alternative	Connection Alternatives	Light Rail Impacts		Traffic Noise Impacts[c]	Proposed Mitigation	Locations Considered for Sound Insulation
		Moderate[a]	Severe[b]			
Segment A						
Preferred Interstate 90 Alternative (A1)	N/A	1	0	0	Potential sound wall	0
Segment B

Leary Way Alternative (E4)	All Segment D alternatives	66	32	0	Sound wall, special trackwork, and building insulation	48

[a] **Moderate impact:** In this range of noise impact, the change in the cumulative noise level is noticeable to most people but might not be sufficient to cause strong, adverse reactions from the community. In this transitional area, other project-specific factors must be considered to determine the magnitude of the impact and the need for mitigation. These factors include the existing noise level, the projected level of increase over existing noise levels, the types and numbers of noise-sensitive land uses affected, the noise sensitivity of the properties, the effectiveness of the mitigation measures, community views, and the cost of mitigating noise to more acceptable levels.

[b] **Severe impact:** Project-generated noise in the severe impact range can be expected to cause a substantial percentage of people to be highly annoyed by the new noise and represents the most compelling need for mitigation. Noise mitigation will normally be specified for severe impact areas unless there are truly extenuating circumstances that prevent it.

[c] These traffic noise impacts are based on the Federal Highway Administration 66 A-weighted decibel (dBA) equivalent continuous sound level (L_{eq}) impact criteria.

[d] Under Alternative B1 all but nine of the traffic noise impacts would also have light rail noise impacts; conversely, there are only five light rail impacts that would not have traffic noise impacts. The total number of residences impacted (single- and multifamily) under this alternative would be 141; 5 would be impacted by light rail noise only, 9 would be impacted by traffic noise only, and 127 would be impacted by both traffic noise and light rail noise.

TABLE 7-2 CONTINUED
Summary of Potential Noise Impacts and Mitigation Measures

Alternative	Connection Alternatives	Light Rail Impacts		Traffic Noise Impacts[c]	Proposed Mitigation	Locations Considered for Sound Insulation
		Moderate[a]	Severe[b]			

[e] Under Alternative B2A all but one of the traffic noise impacts would also have light rail noise impacts. The total number of residences impacted (single- and multifamily) under this alternative would be 79; 62 would be impacted by light rail noise only, 1 would be impacted by traffic noise only, and 16 would be impacted by both traffic noise and light rail noise.

[f] Under Alternatives B3 and B3 – 114th Extension Design Option all but one of the traffic noise impacts would also have light rail noise impacts. For B3, the total number of residences impacted (single- and multifamily) would be 84; 67 would be impacted by light rail noise only, 1 would be impacted by traffic noise only, and 16 would be impacted by both traffic noise and light rail noise. For B3 – 114th Extension Design Option, the total number of residences impacted (single- and multifamily) would be 78; 61 would be impacted by light rail noise only, 1 would be impacted by traffic noise only, and 16 would be impacted by both traffic noise and light rail noise.

[g] Under Alternative C1T all the traffic noise impacts are separate from light rail noise impacts. The total number of residences impacted (single- and multifamily) under this alternative would be 118; 100 would be impacted by light rail noise only, 18 would be impacted by traffic noise only, and 0 would be impacted by both traffic noise and light rail noise.

7.3.1 Segment A

The only noise impact in Segment A would be near the transition from the Mount Baker Tunnel to the floating bridge structure. An expansion joint is required to allow for bridge movement, and increased noise related to the expansion joint could result. If the expansion joint were determined to cause an increased noise level that resulted in a noise impact, then mitigation would likely be a short absorbent sound wall along the side of the structure or absorbent material applied to the existing traffic safety barriers. There would be no traffic-related noise impacts in Segment A.

7.3.2 Segment B

In Segment B, light rail and traffic noise impact would vary with alternative and segment connection. All Segment B alternatives would have light rail noise impacts along the corridor. Alternatives B1, B2A, B3, and B3 – 114th Extension Design Option would have traffic noise impacts in addition to light rail-related noise impacts. *Preferred Alternative B2M* and Alternatives B2E and B7 are designed with no roadway modifications projected to increase noise levels at any noise-sensitive properties and, therefore, would have no traffic noise impacts.

7.3.2.1 Preferred 112th SE Modified Alternative (B2M)

The impacts and mitigation under each of the two *Preferred Alternative B2M* design options would be slightly different. Under *Preferred Alternative B2M* connecting to *Preferred Alternative C11A,* there would be 79 moderate light rail noise impacts projected; 41 of the impacts would occur along the elevated segment from I-90 to the intersection with 112th Avenue SE. These 41 impacts would occur to single-family residences that border SE 34th Street and Bellevue Way, and all would be mitigated with 4- to 6-foot reflective sound walls or 3- to 5-foot acoustical sound walls installed along the elevated structure. When the alternative transitions from the elevated guideway structure to a retained fill, the sound wall would also make a similar transition and might change to an at-grade-style reflective wall, with heights ranging from 6 to 8 feet. The wall would continue reducing in size to ground level where the light rail descends into a retained cut.

North of the 112th Avenue SE intersection, there would be an additional seven noise impacts projected at the single-family residences west of 112th Avenue SE, near SE 17th and SE 14th Streets. There would also be 19 moderate noise impacts identified at the Bellefield Residential Park Condominiums and 12 moderate impacts at single-family residences along 111th Avenue SE just south of the Surrey Downs Park. A continuous sound wall would be installed along the west side of the alternative, beginning just south of the end of the retained cut segment and ending just south of the transition of the alignment to the center of 112th Avenue SE. A second sound wall would begin along the west side of SE 112th Avenue SE, just south of the Bellefield Residential Park Condominiums, continuing to Surrey Downs Park. The sound wall heights would vary as the topographical conditions vary, but is expected to range from 8 to 12 feet in the southern section and could increase to 16 to 18 feet, or taller, near Surrey Downs Park. This wall would also help to reduce traffic noise levels at the single- and multifamily residences in the Bellefield Residential Park Condominiums and the single-family residences along 111th Avenue SE. Building insulation would be considered for up to 10 single- and multifamily homes located near openings in the sound wall for the at-grade crossings at SE 15th Street and SE 8th Street and near Surrey Downs Park .

Under *Preferred Alternative B2M* connecting to *Preferred Alternative C9T*, there would be 66 moderate light rail noise impacts. Noise impacts from I-90 to 112th Avenue SE would be the same as noted above with the connection to *Preferred Alternative C11A*, with 41 moderate impacts. Noise mitigation for this area of the corridor would also be the same as described above for *Preferred Alternative B2M* to *Preferred Alternative C11A*.

North of the intersection of Bellevue Way and 112th Avenue SE, there would be also six impacts at single-family residences west of 112th Avenue SE, near SE 17th and SE 14th Streets, and nine moderate noise impacts identified at the Bellefield Residential Park Condominiums. In addition, there would be 10 moderate impacts at single-family residences along 111th Avenue SE just south of Surrey Downs Park. Mitigation for all of these impacts would include installing a sound wall along the west side of the tracks, beginning just south of the retained cut, and ending just south of SE 8th Street. A second sound wall would be placed along the west side of the station and continue to just south of the 112th Avenue SE at-grade crossing. Openings in the wall would also be required at SE 15th Street for access to the business park.

Impacts under *Preferred Alternative B2M* connecting to Alternative C9T – East Main Station Design Option would be similar to the connection to *Preferred Alternative C9T*, and consequently the proposed mitigation for the connection to this design option would be similar to the connection to *Preferred Alternative C9T*.

Under *Preferred Alternative B2M* connections to *Preferred Alternatives C11A* or *C9T*, or the C9T – East Main Station Design Option, up to 10 single- and multifamily homes located near openings in the sound wall for the at-grade crossings at SE 15th Street and SE 8th Street and near Surrey Downs Park would be evaluated for sound insulation.

7.3.2.2 Bellevue Way Alternative (B1)

With Alternative B1 there would be 4 severe light rail noise impacts, 128 moderate noise impacts, and 136 traffic noise impacts. The severe light rail noise impacts would be near SE 30th Street, due in part to a nearby crossover track. The traffic noise impacts, which would occur along Bellevue Way beginning near SE 30th Street, would be due to roadway widening and would occur at single- and multifamily structures along the entire project corridor. The total number of residences (single- and multifamily) affected with Alternative B1 would be 141, which would include the 128 moderate and 4 severe light rail noise impacts along with the 136 traffic noise impacts, as the vast majority of residences are projected to have both light rail and traffic noise impacts.

Mitigation measures for Alternative B1 would include a variety of mitigation measures, including sound insulation of structures as needed, special trackwork at the crossovers, and potentially some sound walls, if it is determined that they would be effective at reducing noise. One of the primary issues of using sound walls along Alternative B1 is the required openings for driveways and vehicle and pedestrian access at intersections and for access to many of the single- and multifamily units along the corridor. In order to evaluate the worst-case scenario, Sound Transit determined, after reviewing the corridor and location of intersections and driveways, that sound walls would not be a feasible form of mitigation in most of the corridor; therefore, sound insulation is assumed to be the main form of mitigation. Based on this assumption, there are up to 141 units that would be considered for sound insulation. If, during final design, Sound Transit determines that sound walls could be installed, then the number of buildings considered for insulation could be lower.

7.3.2.3 116th SE Tunnel Alternative (B2A)

With Alternative B2A, there would be 78 light rail noise impacts and along with 17 traffic noise impacts. Light rail noise impacts would occur along the elevated section from I-90, past the South Bellevue Park-and-Ride, and continue to the at-grade segment just south of the 112th Avenue SE intersection. There would also be light rail noise impacts along 112th Avenue SE at the single- and multifamily residences from SE 17th Street to Surrey Downs Park. Traffic noise impacts are only projected to occur between the South Bellevue Station and 112th Avenue SE due to road widening.

Mitigation for Alternative B2A would include sound walls, sound insulation, and special trackwork at the crossovers. Sound walls would be used along the elevated segment near I-90 and along Bellevue Way. When the alternative profile transitions to at-grade, sound walls might not be feasible due to pedestrian and vehicle access requirements; in those areas, sound insulation would be used to provide mitigation to the single- and multifamily residences. An estimated 17 residences, along the at-grade segment on Bellevue Way, would be considered for sound insulation. If, during final design, Sound Transit determines that sound walls could be installed, then this number could be reduced.

7.3.2.4 112th SE Elevated Alternative (B2E)

Light rail noise impacts were identified at 106 single- and multifamily residences under Alternative B2E; this includes 21 impacts considered severe under the FTA criteria. There would be no traffic noise impacts under Alternative B2E. For Alternative B2E, sound walls and special trackwork would be effective at mitigating all but five of the projected noise impacts. The remaining five impacts, all along Bellevue Way SE, would be further evaluated during final design and could receive sound insulation, taller sound walls, or other mitigation methods to assist in reducing the noise levels.

7.3.2.5 112th SE Elevated Alternative (B3)

Project noise impacts from Alternative B3 would be very similar to those described for Alternative B2A and would include 79 moderate and 4 severe light rail noise impacts, along with 17 traffic noise impacts. Mitigation for Alternative B3 would include sound walls, sound insulation, and special trackwork at the crossovers. There would be an estimated 17 residences evaluated for sound insulation, all located along the at-grade segment on Bellevue Way SE. These 17 residences are projected to have noise impacts from traffic noise, with 16 of those also meeting or exceeding the FTA criteria for light rail noise. If, during final design, Sound Transit determines that sound walls could be installed, then this number could be reduced.

Proposed mitigation for the B3 – 114th Extension Design Option would be similar to that proposed for Alternative B3.

7.3.2.6 BNSF Alternative (B7)

Alternative B7 along the former BNSF Railway corridor would result in 176 light rail noise impacts, including 68 severe impacts. The severe impacts would be a result of the alternative’s crossover near the Emerald Apartments and the trains’ high speed and proximity to the Brookshire Condominiums. Mitigation for Alternative B7 would include sound walls and special trackwork at the crossovers. With the proposed mitigation measures, all noise impacts would be mitigated and no sound insulation would be needed.

7.3.3 Segment C

In Segment C, light rail noise impacts would vary with alternative and segment connection. All of the Segment C alternatives would have light rail noise impacts along the corridor, although only Alternative C1T would have traffic noise impacts. The design of *Preferred Alternatives C11A* and *C9T* have no roadway modifications that are projected to increase noise levels at any noise-sensitive properties and, therefore, would have no traffic noise impacts.

7.3.3.1 Preferred 108th NE At-Grade Alternative (C11A)

Under *Preferred Alternative C11A* connecting from *Preferred Alternative B2M* there would be 119 moderate light rail noise impacts and 65 severe impacts projected. The severe impacts would occur to several homes along 111th Avenue SE due to a nearby crossover and loss of shielding from existing buildings. The other severe impacts would occur at several multifamily units along 108th Avenue NE from bells and proximity to the tracks, and at the Lake Bellevue Village Condominiums. Severe impacts are also projected at the Coast Bellevue Hotel from a nearby crossover and the proximity of the tracks to the hotel rooms. There would be no roadway modifications and no traffic noise impacts associated with this alternative.

Mitigation measures would include a sound wall along the west side of the alignment beginning near SE 6th Street and continue as a sound barrier to 108th Avenue NE, just south of Main Street. The wall would be located near the tracks on the retained fill and elevated structure to the 108th Station. The sound wall/barrier, along with special trackwork at the crossover along 112th Avenue SE, would mitigate all impacts along this section of the corridor. Sound walls and special trackwork for the crossover would also be used to mitigate impacts on the Coast Bellevue Hotel and Lake Bellevue Village Condominiums. Multifamily units located on Main Street, 108th Avenue NE, and NE 6th Street would be mitigated with sound insulation where necessary. Based on the current analysis, up to 108 units would be evaluated for sound insulation.

If *Preferred Alternative C11A* were connected to Alternative B3, B3 - 114th Extension Design Option, or Alternative B7, then the noise mitigation measures would be similar to those described above. Because this alternative connection is not along 112th Avenue SE, however, the sound wall along this section would not be needed, but an elevated sound wall would be required near the Hilton Hotel. Under this alternative connection, 144 units would be evaluated for sound insulation.

7.3.3.2 Preferred 110th NE Tunnel Alternative (C9T)

Preferred Alternative C9T connecting from *Preferred Alternative B2M* is projected to result in 119 light rail noise impacts, including 62 moderate and 57 severe. The severe impacts would occur at a multifamily building in Downtown Bellevue, one hotel, and the Lake Bellevue Village Condominiums, and depending on the location, would be a result of the proximity to the tracks and crossovers, and bells related to at-grade crossings.

Mitigation measures would be the same as those described for *Preferred Alternative C11A*. Through most of the downtown area, however, the alternative profile is in a tunnel, and therefore the total number of noise impacts would be reduced. The only units requiring sound insulation evaluation would be two single-family residences because of their proximity to an at-grade crossing with gates and warning bells, and at a newly constructed highrise on NE 6th Street where the only feasible form of mitigation would be sound insulation.

If *Preferred Alternative C9T* connected to Alternative B3, B3 - 114th Extension Design Option, or Alternative B7, then the noise mitigation measures would be similar to those described above. Because the alternative route would not travel along 112th Avenue SE with these connections, however, the sound wall along this section would not be needed, but a sound wall on the elevated guideway would be required near the Hilton Hotel. The revised alternative connection is still projected to result in 84 residential units being evaluated for sound insulation.

Proposed mitigation for Alternative C9T – East Main Station Design Option would be similar to that proposed for *Preferred Alternative C9T*, with 50 residential units being evaluated for sound insulation.

7.3.3.3 Bellevue Way Tunnel Alternative (C1T)

South of Main Street, Alternative C1T would be the only Segment C alternative with traffic noise impacts, which would result from roadway modifications on Bellevue Way that would impact 18 multifamily units. Light rail related-impacts under Alternative C1T would result in 48 moderate and 52 severe impacts. Mitigation for the 18 multifamily units with traffic noise impacts would likely be sound insulation, although if this alternative were selected, sound walls would be evaluated during final design. Given the requirements for pedestrian and vehicle access, upper floor units, balconies, and lanais, however, sound walls would not likely be a feasible form of mitigation in this area. In addition, 51 units, for a total of 69 units, would be evaluated for sound insulation. Sound walls and special trackwork would be used to mitigate noise levels at the Coast Bellevue Hotel and the Lake Bellevue Village Condominiums.

7.3.3.4 106th NE Tunnel Alternative (C2T)

Alternative C2T connecting from Alternative B2A is projected to have the same light rail impacts as Alternative C1T but without any traffic noise impacts. When connecting from Alternative B2E, Alternative C2T would have severe light rail noise impacts at 2 single-family residences, 28 multifamily residences, and 36 hotel rooms, in addition to 113 moderate light rail noise impacts. When connecting to Alternative B3 or B7, Alternative C2T would have 48 moderate light rail noise impacts and 16 severe light rail noise impacts at multifamily residences. There would also be 54 severe impacts and 18 moderate impacts at hotel rooms, for a total of 136 impacts. There would be no traffic noise impacts under any of the Alternative C2T connection options.

Mitigation measures for Alternative C2T, under all connections, would include sound walls, special trackwork at crossovers, and sound insulation. Sound walls and special trackwork would be used to mitigate impacts for the connections from Alternative B2E, B3, or B7 south of Main Street. The 48 multifamily impacts along NE 6th Street would receive sound insulation, and sound walls and special trackwork would be used to mitigate noise levels at the Coast Bellevue Hotel and the Lake Bellevue Village Condominiums.

7.3.3.5 108th NE Tunnel Alternative (C3T)

Alternative C3T would result in a total of 26 light rail impacts when connecting to Alternative B2A, 105 impacts when connecting to Alternative B2E, and 62 impacts when connecting to Alternative B3 or B7. The connection to Alternative B2A would have the fewest impacts due to the tunnel, with 21 multifamily impacts and 5 single-family impacts, all located along NE 12th Street near 112th Avenue NE. With the connection to Alternative B2E, there would be an additional 79 impacts, including severe impacts at 2 single- and 12 multifamily residences and 91 moderate impacts along the project corridor. Finally, Alternative C3T connecting to Alternative B3 or B7 is projected to have 62 light rail noise impacts, including 18 severe impacts at the Bellevue Hilton Hotel along the side of the structure facing I-405.

Mitigation measures under Alternative C3T would vary slightly, depending on the connection alternative. When connecting to Alternative B2A, the primary mitigation measure would be sound walls along 112th Avenue SE and on NE 12th Street. Sound walls, along with special trackwork and building insulation, would be required to mitigate the impacts under the connection to Alternative B2E. Finally, impacts with the connection to Alternative B3 or B7 could be fully mitigated with sound walls. Therefore, all noise impacts under Alternative C3T would be mitigated regardless of the Segment B connection alternative.

7.3.3.6 Couplet Alternative (C4A)

Alternative C4A connecting from Alternative B2A would have the highest number of noise impacts because of the highrise apartments along 108th and 110th Avenues NE, with 435 moderate and 15 severe impacts throughout the alternative corridor. When connecting from Alternative B2E, Alternative C4A would have a similar level of noise impacts, with a potential for a slight change, depending on the location of a crossover. When connecting to Alternative B3 or B7, Alternative C4A would have moderate light rail noise impacts at 420 residences and hotels and an additional severe impact at one single-family residence and 18 hotel rooms.

Mitigation measures for Alternative C4A would combine sound walls, special trackwork at crossovers, and sound insulation. Sound walls along the elevated guideway structure would effectively mitigate impacts south of Main Street under all Segment B connection alternatives. North of Main Street, the large number of highrise apartments and condominiums would be mitigated with sound insulation. Finally, there are possible locations for sound walls along the at-grade segment north of NE 12th Street; however, an opening in the sound wall for the gated crossing at 110th Avenue NE and SE 12th Street, could allow noise to be transmitted back into the single-family residential area north of NE 12th Street. Due to the large number of highrise apartments and condominiums along 108th and 110th Avenues NE, there would be approximately 364 units under the connections to Alternatives B2A or B2E, and 400 units under the connection to Alternatives B3 or B7, that would be evaluated for sound insulation.

7.3.3.7 112th NE Elevated Alternative (C7E)

Under Alternative C7E, the connector from Alternative B2A would cause severe light rail noise impacts at 12 multifamily units and moderate impacts at 13 single-family residences, 197 multifamily residences, and 60 hotel rooms. With the elevated connection to Alternative B2E, the number of impacts would be the same as those from Alternative B2A. When connecting to Alternative B3 or B7, Alternative C7E would have moderate light rail noise impacts at 4 single-family residences, 168 multifamily residences, and at 36 hotel rooms along 114th Avenue SE.

For an elevated alternative such as Alternative C7E, all noise impacts could be mitigated by using sound walls and special trackwork at crossovers. With the proposed acoustical sound walls on the elevated structure and special trackwork at crossovers, all noise impacts could be mitigated.

7.3.3.8 110th NE Elevated Alternative (C8E)

Alternative (C8E) would have 425 impacts, including severe impacts at 72 multifamily units and moderate light rail noise impacts at 120 hotel rooms, 224 multifamily, and 9 single-family residences.

Mitigation for Alternative C8E would include acoustical sound walls on the elevated guideway. With the proposed mitigation measures, all noise impacts would be mitigated.

7.3.3.9 110th NE At-Grade Alternative (C9A)

Alternative C9A only connects to Alternative B2A, B3, B7, or B3 – 114th Extension Design Option. With the connection to Alternative B2A, 185 moderate and 56 severe light rail noise impacts are projected. With a connection to Alternative B3, B3 – 114th Extension Design Option, or B7, those numbers would be reduced to 145 moderate and 54 severe light rail impacts. Mitigation for Alternative C9A would include sound walls, special trackwork, and sound insulation. Sound walls would be used along the retained fill and elevated section from Alternative B2A, and the elevated section from Alternative B3, B3 – 114th Extension Design Option, or B7, along with special trackwork at crossovers. Sound walls, along with special trackwork at crossovers, would also be used to mitigate noise levels at the Coast Bellevue Hotel and the Lake Bellevue Village Condominiums. Under the connection to Alternative B2A, 120 units would be evaluated for sound insulation. Under the connection to Alternatives B3, B3 – 114th Extension Design Option, or B7, 156 units would be evaluated for sound insulation.

7.3.3.10 112th NE Elevated Alternative (C14E)

Alternative C14E, which is elevated along 114th Avenue NE, is projected to have 16 severe impacts at multifamily residences along with 96 severe and 36 moderate impacts at hotel rooms.

Mitigation for Alternative C14E would include acoustical sound walls on the elevated structure and special trackwork at crossovers. With the proposed mitigation measures, all noise impacts would be mitigated.

7.3.4 Segment D

In Segment D there would be noise impacts only under Alternatives D2E, D3, and D5. No roadway modifications are planned that would increase noise levels at any noise-sensitive properties; therefore, no traffic noise impacts were identified.

7.3.4.1 Preferred NE 16th At-Grade Alternative (D2A)

No noise impacts were identified for *Preferred Alternative D2A*; therefore, no noise mitigation is proposed.

7.3.4.2 D2A - 120th Station or NE 24th Design Option

No noise impacts were identified for the D2A - 120th Station or D2A - NE 24th Design Options, so no noise mitigation is proposed.

7.3.4.3 NE 16th Elevated Alternative (D2E)

Under the connections from NE 12th Street (Alternatives C3T, C4A, C7E, and C8E), noise impacts are projected under Alternative D2E at the new Children's Hospital BCSC on 116th Avenue NE and to the exterior of the Pacific Northwest Ballet School on NE 16th Street and 136th Place NE. The noise impact on the hospital would be mitigated with a sound wall along the north side of the tracks. Noise mitigation for the school would be evaluated during final design, and could include building sound insulation, if needed.

Under Alternative D2E when connected to the alternatives along the former BNSF Railway corridor (Alternatives C1T and C2T), the only noise impact would be at the exterior of the Pacific Northwest Ballet School. Noise mitigation would be evaluated during final design and could include building sound insulation, if needed. No further noise mitigation would be required for Alternative D2E.

7.3.4.4 NE 20th Alternative (D3)

With the connections from NE 12th Street (Alternatives C3T, C4A, C7E, and C8E), noise impacts are projected under Alternative D3 at the new Children's Hospital BCSC on 116th Avenue NE. The noise impacts would be mitigated with a sound wall along the north side of the tracks. No noise impacts are projected under Alternative D3 when connected to the alternatives along the former BNSF Railway corridor (Alternatives C1T and C2T), and no further mitigation would be required.

7.3.4.5 SR 520 Alternative (D5)

Severe noise impacts were identified under Alternative D5 for 10 units at an apartment building near SR 520, off of Northup Way. These 10 severe impacts would occur regardless of the connection options. Under the connections from NE 12th Street (Alternatives C3T, C4A, C7E, and C8E), noise impacts are also projected at the new Children's Hospital BCSC on 116th Avenue NE. All impacts would be mitigated with sound walls. For the 10 apartment units, the sound wall would be on the south side of the tracks, and the Children's Hospital BCSC on 116th Avenue NE would be mitigated with a sound wall along the north side of the tracks.

7.3.5 Segment E

In Segment E, light rail noise impacts were identified for all build alternatives. Because of the variance in the locations of the alternatives, the impacts and mitigation would vary when the route is north of the West Sammamish Parkway exit from SR 520. No roadway modifications are planned that increase noise levels at any noise-sensitive properties, and therefore, no traffic noise impacts were identified.

7.3.5.1 Preferred Marymoor Alternative (E2)

Under *Preferred Alternative E2,* 148 severe and 33 moderate noise impacts were identified; this includes 9 moderate and 4 severe single-family impacts near SR 520 at West Lake Sammamish Parkway NE, 144 severe impacts at newly constructed multifamily units, and 24 moderate impacts at a hotel. Mitigation for *Preferred Alternative E2* includes sound walls near SR 520 at West Lake Sammamish Parkway NE, special trackwork at crossovers, and sound insulation at several multifamily buildings and a hotel. Based on the current analysis, up to 144 residential units and 24 hotel rooms could be evaluated for sound insulation.

Noise impacts under the E2 - Redmond Transit Center Design Option would be the same as *Preferred Alternative E2*; however, under this design option, 81 of the impacts would be moderate and 100 would be severe. This difference is because one of the newly constructed multifamily buildings would not have a noise impact as it would under the *Preferred Alternative E2*; however, another building near the terminus would have the same number of moderate impacts. Mitigation would still include sound walls near SR 520 at West Lake Sammamish Parkway NE, special trackwork at crossovers, and sound insulation at several multifamily buildings and a hotel.

7.3.5.2 Redmond Way Alternative (E1)

Under Alternative E1, light rail noise impacts were identified at 9 single-family units, 236 multifamily units, and 72 hotel rooms; these include severe impacts at two single-family residences and 148 multifamily units. Mitigation would include sound walls near SR 520 at West Lake Sammamish Parkway NE, special trackwork at crossovers, and sound insulation at several multifamily buildings and a hotel. An estimated 288 noise impacts at a hotel and multifamily structures adjacent to the corridor would be considered for sound insulation.

7.3.5.1 Leary Way Alternative (E4)

Alternative E4 would have 66 moderate impacts and 32 severe impacts related to light rail operations; no traffic or other noise impacts were identified in Segment E. Mitigation would include sound walls near SR 520 at West Lake Sammamish Parkway NE continuing along the elevated trackway to Leary Way, special trackwork at crossovers, and sound insulation at several multifamily buildings and a hotel.

7.3.6 Station Noise Mitigation

To reduce noise levels at station platforms, Sound Transit would incorporate design measures to reduce freeway noise for patrons waiting at station platforms. These design measures would be considered at any station where Sound Transit's design goal of 78 dBA Leq (15-minute and 1-hour) for noise from exterior sources at station platforms is exceeded.

7.3.7 Maintenance Facility Noise Mitigation

The only maintenance facility alternative located in an area with nearby noise-sensitive uses is MF1. Noise impacts were identified at the Children's Hospital BCSC under the FTA impact criteria. Because the maintenance facilities are fixed sites, with most noise-producing activities occurring indoors, the potential noise impacts would all be due to train activity along the tracks in the facility. Noise impacts would be mitigated through the installation of a sound wall approximately 12 feet tall along southern side of the site. The proposed sound wall would mitigate the noise impacts at the hospital.

7.4 Potential Light Rail Vibration Mitigation Options

This assessment assumes that the vehicle wheels and track would be maintained in good condition with regular wheel truing and rail grinding, in accordance with Sound Transit maintenance procedures. Beyond this, there are several approaches to reduce groundborne vibration from light rail operation, described in the following subsections. In almost all cases, vibration mitigation is possible with either ballast mats or resilient rail fasteners. At some locations, however, the tracks are within less than 20 feet of buildings, and the vibration levels are too high for mitigation to be completely effective. At these locations, project design modification and additional information on affected buildings could eliminate these impacts. For example, the type of building foundation might reduce vibration impacts; therefore, these residual impacts might be eliminated.

7.4.1 Ballast Mats

A ballast mat consists of a pad made of rubber or rubber-like material placed on an asphalt or concrete base with the normal ballast, ties, and rail on top. The reduction in groundborne vibration provided by a ballast mat strongly depends on the vibration frequency content and the design and support of the mat.

7.4.2 Resilient Rail Fasteners

Resilient fasteners can be used to provide vibration isolation between rails and concrete slabs for direct fixation track typically on elevated structures or in tunnels. These fasteners include a soft, resilient element to provide greater vibration isolation than standard rail fasteners in the vertical direction. This type of mitigation can be used in tunnels instead of floating slabs, where appropriate.

7.4.3 Tire-Derived Aggregate

Also known as shredded tires, a typical tire-derived aggregate (TDA) installation consists of an underlayer of 12 inches of nominally 3-inch-size tire shreds or chips wrapped with filter fabric, covered with 12 inches of subballast, and 12 inches of ballast above that to the base of the ties. This type of mitigation can only be used on ballast and tie track. Tests suggest that the vibration-attenuation properties of this treatment are midway between that of ballast mats and floating slab track. While this is a low-cost option, it has only recently been installed on two U.S. light rail transit systems—in San Jose and Denver—and its long-term performance is unknown.

7.4.4 Floating Slabs

Floating slabs consist of thick concrete slabs supported by resilient pads on a concrete foundation; the tracks are mounted on top of the floating slab. Although floating slabs are designed to provide vibration reduction at lower frequencies than ballast mats, they are extremely expensive and are rarely used, except in the most extreme situations. Most successful floating-slab installations are in subways, and their use for at-grade track is less common and often not reasonable.

7.4.5 Special Trackwork

Because the impacts of vehicle wheels over rail gaps at track turnout locations increases groundborne vibration by about 10 VdB, turnouts are a major source of vibration impact when they are located in sensitive areas. If turnouts cannot be relocated away from sensitive areas, then another approach is to use spring-rail, flange-bearing or moveable-point frogs in place of standard rigid frogs at turnouts. These devices allow the flangeway gap to remain closed in the main traffic direction for revenue service trains.

7.5 Potential Light Rail Vibration Mitigation Measures

Vibration and groundborne noise impacts that exceed FTA criteria are considered to be significant and warrant mitigation, if reasonable and feasible. In almost all cases, vibration mitigation is possible with either ballast mats or resilient rail fasteners. Table 7-3 lists the number of proposed light rail vibration and groundborne noise impacts and the distances of contiguous locations along each alternative where mitigation measures are recommended.

TABLE 7-3
Vibration Mitigation Locations

[a] Mitigation for *Preferred Alternative C9T* connecting to *Preferred Alternative B2M* would include either relocating the crossover on 112th Avenue SE or using special track work to eliminate the impact from the crossover. This would eliminate five vibration impacts.

At some locations, light rail trackways or guideways would be within 20 feet of buildings and vibration mitigation would not be effective at reducing the vibration level to below the FTA criteria. At these locations, project design modification and additional information on affected buildings could eliminate these impacts. For instance, the type of building foundation might reduce vibration impacts and therefore, these residual impacts might be eliminated.

In addition, each building would need to be examined in detail to determine where the vibration-sensitive uses are located. For example, the side of a building nearest the proposed alternative might be a vibration-sensitive use. Buildings that are mixed-use might not have sensitive uses on lower floors where impacts would occur, and the vibration would not be noticeable by the time it reached higher floors with sensitive uses, such as sleeping quarters. Outdoor-to-indoor vibration testing, which tests how the vibration changes from the soil outside to a sensitive space inside a building, would also help to refine the vibration projections at these locations. A summary of segment-specific vibration mitigation is provided below.

In Segment A, approximately 1,900 feet of vibration mitigation would be required along the Mount Baker Tunnel area to mitigate groundborne noise impacts at single-family homes along the top of the hillside. No other vibration impacts were identified in Segment A.

In Segment B, mitigation measures under *Preferred Alternative B2M* connecting to *Preferred Alternatives C11A* or *C9T* would include up to 600 feet of vibration isolation at the Winters House. Standard vibration mitigation methods, such as resilient fasteners or ballast mats, would reduce the groundborne noise level at the Winters House, but may not eliminate the impact and would be determined in final design. A floating slab might be needed to eliminate the groundborne noise impact. For *Preferred Alternative B2M* connecting to the C9T – East Main Station Design Option, the crossover at SE 8th Street would need to be relocated or special trackwork would need to be used to eliminate the gap due to the crossover. The only other vibration impact in Segment B would be with Alternative B1, where vibration mitigation would be required at one single-family residence near SE 13th Street.

In Segment C, under *Preferred Alternative C11A*, vibration mitigation would be required at two single-family residences south of Main Street, three multifamily structures along 108th Avenue NE, and the elevated structure by the Coast Bellevue Hotel. Under *Preferred Alternative C9T*, vibration mitigation would also be required at the same two single-family residences and the Coast Bellevue Hotel identified under *Preferred Alternative C11A*, along with five single-family residences near the crossover on 112th Avenue SE. These five single-family residential impacts could be eliminated by the relocation of the crossover or the use of special trackwork to eliminate the gap. *Preferred Alternative C9T* would have groundborne noise impacts at the Meydenbauer Center, a highly sensitive location, where impacts would be mitigated using ballast mats or resilient rail fasteners. For the C9T – East Main Station Design Option, the impacts and required mitigation would be identical to that described above for *Preferred Alternative C9T*, except for the five single-family residences on 112th Avenue SE, which would not have vibration impacts with this design option because the crossover would be relocated to Segment B and replaced with the East Main Station.

Vibration mitigation under Alternative C1T would be included near the tunnel portal and tunnel segment along Bellevue Way for one single-family residence, and on the elevated structure for the Coast Bellevue Hotel. Under Alternative C2T mitigation would only be required at one single-family residence south of Main Street when connecting to Alternative B2E. No other vibration or groundborne noise impacts were identified under Alternative C2T.

With Alternative C3T, the connection to Alternative B2A would require mitigation for groundborne noise at 12 single-family residences. All except one of the impacts are located on top of the tunnel south of Main Street. Under the Alternative C3T connection to Alternative B2E, one single-family residence on the south side of Main Street is identified as having groundborne noise impacts. Under the Alternative C3T connection to Alternative B2E, B3, or B7, one single-family residence near McCormick Park is identified as having groundborne noise impacts. Alternative C4A would require vibration mitigation for six multifamily residences and one single-family residence, regardless of the connection options. The multifamily impacts are along 108th and 110th Avenues NE, while the single-family impact is just south of Main Street.

With Alternative C7E no vibration or groundborne noise impacts are predicted. Alternative C8E would have vibration mitigation along the elevated guideway just north of Main Street for a hotel and multifamily residence, and again along 108th Avenue NE for two additional multifamily units. There would also be vibration mitigation north of NE 12th Street to mitigate two single-family residences with vibration impacts. Alternative C9A would require vibration mitigation for two single-family residences south of Main Street, three multifamily residences along 110th Avenue NE, and at the Coast Bellevue Hotel. Alternative C14E would also require vibration mitigation along the elevated guideway for impacts predicted at three hotels.

For *Preferred Alternatives C11A* and *C9T*, and the C9T – East Main Station Design Option, the only residual vibration impact would at the Coast Bellevue Hotel. For Alternative C4A, residual vibration impacts would include two multifamily buildings on the southbound couplet track. For Alternative C8E, residual vibration impacts would occur at the Sheraton Hotel and one multifamily building. Additional testing could be performed at these locations to determine the response of the building foundations to light rail vibration, which would likely reduce the projected vibration levels. In addition, a survey of the buildings needs to be performed to determine the specific locations of vibration sensitive uses within the structures to assess actual impacts. For Alternative C9A, there would be a residual vibration impact at two multifamily buildings and at the Coast Bellevue Hotel. For Alternative C14E, there would be a residual vibration impact at the Sheraton Hotel.

There would be no vibration or groundborne noise impacts in Segment D, and no vibration mitigation is recommended.

With *Preferred Alternative E2* and the E2 – Redmond Transit Center Design Option, an estimated 700 feet of vibration mitigation would be required along SR 520 to mitigate vibration impacts on three single-family residences. Vibration impacts and mitigation would be the same under Alternative E1 as described for *Preferred Alternative E2*. With Alternative E4, vibration mitigation would be required at one single-family residence along SR 520, a group of multifamily units off Leary Way, and the Residence Inn Hotel. For *Preferred Alternative E2*, the E2 – Redmond Transit Center Design Option, and Alternative E1, one single-family residence would be a residual impact after mitigation.

7.5.1 Potential Vibration Mitigation for Highly Sensitive Locations

The groundborne noise impact on the Meydenbauer Center from *Preferred Alternative C9T* and the C9T – East Main Station Design Option could be mitigated through the installation of ballast mats or resilient rail fasteners.

7.6 Potential Construction Noise Mitigation Measures

Sound Transit has developed a Construction Noise Mitigation Policy. Under this policy, Sound Transit would seek to limit construction noise levels and impacts and meet applicable noise regulations and ordinances. Typical mitigation measures that could be applied are discussed below, and a specific construction noise analysis will be performed with the selection of the *Preferred Alternative*. Contractors would be required to meet the criteria in city noise ordinances.

Several noise-mitigation measures can be implemented to limit construction noise impacts. Sound Transit would, as practical, limit construction activities that produce the highest noise levels during daytime hours, or when disturbance to sensitive receivers would be minimized. For operation of construction equipment that could exceed allowable noise limits during nighttime hours (between 10 p.m. and 7 a.m.) or on Sundays or legal holidays, Sound Transit would obtain the appropriate noise variance from the City of Seattle, the City of Mercer Island, the City of Bellevue, or the City or Redmond. Sound Transit would control nighttime construction noise levels by applying noise-level limits and noise-control measures where necessary. The contractor would have the flexibility of either prohibiting certain noise-generating activities during nighttime hours or providing additional noise-control measures to meet these noise limits. Noise-control mitigation might include the following measures, as necessary, to meet required noise limits:

- Install construction site sound wall by noise-sensitive receivers.
- During nighttime work, use smart back-up alarms that automatically adjusts or lowers the alarm level or tone based on the background noise level, or switch off back-up alarms and replace with spotters.
- Use low-noise emission equipment.
- Implement noise-deadening measures for truck loading and operations.
- Conduct monitoring and maintenance of equipment to meet noise limits.
- Use lined or covered storage bins, conveyors, and chutes with sound-deadening material.
- Use acoustic enclosures, shields, or shrouds for equipment and facilities.
- Install high-grade engine exhaust silencers and engine-casing sound insulation.
- Prohibit aboveground jack-hammering and impact pile driving during nighttime hours.
- Minimize the use of generators or use whisper quiet generators to power equipment.
- Limit use of public address systems.
- Use movable noise barriers at the source of the construction activity.
- Limit or avoid certain noisy activities during nighttime hours.

To mitigate noise related to pile-driving, using an augur to install the piles instead of a pile-driver would greatly reduce the noise levels. If pile-driving is necessary, then the only mitigation would be to limit the time of day the activity can occur. Pile-driving is not expected at most construction locations.

7.6.1 Segment A Construction Noise Mitigation

Construction noise mitigation for Segment A would include the mitigation measures described above. No additional noise mitigation other than those provide should be required.

7.6.2 Segment B Construction Noise Mitigation

Construction noise mitigation for Segment B would include the mitigation measures described above. No additional noise mitigation other than those provide should be required.

7.6.3 Segment C Construction Noise Mitigation

Construction noise mitigation for Segment C would include the mitigation measures described above. Because of the staging areas and tunnel portals along Bellevue Way, 112th Avenue SE, Main Street, and NE 12th Street, temporary sound walls could be constructed near tunnel staging areas to reduce noise levels at nearby residential land uses in the Surrey Downs neighborhood and near McCormick Park.

7.6.4 Segment D Construction Noise Mitigation

Construction noise mitigation for Segment D would include the mitigation measures described above. No additional noise mitigation other than those provide should be required.

7.6.5 Segment E Construction Noise Mitigation

Construction noise mitigation for Segment E would include the mitigation measures described above. Constructing the East Link route along SR 520 near 51st Street NE could move existing sound walls; every attempt should be made to replace the wall early in the project to minimize impacts on nearby residents before track construction.

7.7 Potential Construction Vibration Mitigation Measures

In general, building damage from construction vibration would only be anticipated from impact pile driving close to buildings. If piling is more than 50 to 100 feet from buildings, or if alternate methods, such as auger cast piling or drilled shafts are used, then damage from construction would not be anticipated. Other sources of construction vibration, including potential ground improvement activities in Segment B such as construction of subsurface stone columns, could generate high enough vibration levels for localized damage to occur, depending on the soil type and distance between the source of vibration and the nearest building. In any locations of concern, preconstruction surveys would be conducted to document the existing condition of buildings, in case there was an issue during or after construction, and vibration monitoring would be implemented during construction to establish levels of vibration. Where levels of vibration exceed preset limits for damage, the contractor would be required to stop work and switch to alternate construction methods.

Measures to minimize short-term annoyance from groundborne vibration and groundborne noise from construction activities such as pile installation or compaction of earth fills include use of alternate methods that result in less vibration or noise, such as auger cast piles or drilled shafts in place of driven piles, or use of static roller compactors rather than vibratory compactors. The hours and duration of these types of activities can also be restricted to hours when vibrations and noise are less noticeable. Vibration monitoring would be considered for pile driving, tunnel boring, vibratory sheet installation, and other construction activities that have the potential to cause high levels of vibration.

Sound Transit would minimize vibration at the Winters House during construction and prevent damage or limit to minor cosmetic damage by using the following methods:

- Install monitoring equipment and monitor vibration during construction.
- Place limits on the construction vibration levels for the contractor, with the contractor selecting one or more of the following measures or other measures of equivalent effectiveness to limit construction:
  - Using auger-drilling methods
  - Using low vibration or nonimpact methods of installing steel casing required to support construction of drilled shaft or secant pile foundations
  - Using slurry confinement (i.e., temporarily filling the cavity with slurry material to replace the removed soil)
  - Underpinning foundation and employing structural support or soil stabilization if needed
  - Adjusting excavation methods based on monitoring results
  - Installing a shallow temporary supporting wall
  - Monitoring vibration levels associated with equipment to be used for the East Link Project at other construction sites with similar soils before project construction to determine which vibration-minimization method would be necessary
  - Beginning vibration-inducing construction at the site at points more distant from the Winters House to enable the contractor to determine which vibration-minimization method would be necessary
- Photographing and inventorying the building to establish existing conditions to determine if any damage is caused by construction, and repair the building in a manner consistent with the U.S. Department of the Interior Secretary’s standards for treating historic properties.

Appendix H
History of I-90 Agreements and Studies

Interstate 90 Transportation Studies

This appendix summarizes and compares the East Link Environmental Impact Statement (EIS) transportation analysis of the I-90 corridor across Lake Washington with two previous operational studies of HCT in this corridor. Using Interstate 90 (I-90) as the primary corridor for cross-Lake Washington high-capacity transit (HCT) in the Puget Sound region has been identified and evaluated for the last 40 years. The history of this analysis is summarized in Chapter 2 of this Final EIS and fully documented in the *East Corridor High Capacity Transit Mode History* report (August 2006). Coupled with this was an understanding, dating back to the 1960s, that rail would be the preferred transit service mode between Seattle and Bellevue. The 1976 I-90 Memorandum Agreement (amended in 2004) was one of the first documents that specified that the I-90 reversible center roadway be designed for and permanently committed to future transit use, including the potential to convert all or part of the transit roadway to fixed guideway. In the 1980s, the current Metropolitan Planning Organization (Puget Sound Council of Governments [PSCOG]) conducted various studies that recommended rail service on I-90. In 1996, with voter approval of Sound Move and with the formation of Sound Transit, the Long Range Vision (1996) identified the development of HCT across I-90 with future rail. Concurrently, the Trans-Lake Washington Study (Washington State Department of Transportation [WSDOT] and Sound Transit) analyzed HCT and found rail to be a viable option. Most recently, in July 2005, the Sound Transit Board identified light rail as the preferred mode across I-90 serving the East Corridor, and in July 2008, included the East Link Light Rail Project in the ST2 Program. Most recently, the East Link project received a finding of engineering and operational acceptability from Federal Highway Administration (FHWA) through the Project's Interchange Justification Report (IJR) process in June 2011. All of these studies have endorsed an objective of placing fixed guideway transit within I-90's center roadway. Implementation of this objective has included three operational analysis studies:

- I-90 Two-Way Transit and HOV Operations EIS (WSDOT, Sound Transit, Federal Highway Administration [FHWA]) – This study considered five alternatives and confirmed the need for two-way transit/high-occupancy vehicle (HOV) operations across I-90.
- I-90 Center Roadway Study (WSDOT) – This study considered three alternatives and confirmed the utility of the center roadway as an HCT facility with no center roadway access for vehicles.
- East Link Project EIS (Sound Transit) - This project considered light rail alternatives on I-90 and potentially confirms the need for light rail transit in the center roadway linking the Eastside and Seattle.

The I-90 Two Way Transit and HOV Operations Project was conducted in the early 2000s with an adopted EIS in 2002. This study recommended an alternative (Alternative R-8A) to put HOV lanes on both the eastbound and westbound roadways between Mercer Island and Seattle. The next study, I-90 Center Roadway study, completed in 2006, evaluated various Alternative R-8A scenarios and a form of HCT on I-90. Lastly, the East Link EIS evaluates a similar set of scenarios as the I-90 Center Roadway study but with different assumed conditions.

With the quickly changing state of the transportation analysis practice, the evolution and use of analytical models, and shifting background assumptions, many elements in each of these three studies are different (see Table H-1 at the end of this appendix). Not only are the measures of effectiveness different but as a result of changing baseline parameters, results are different. Beginning with the first study, evaluation of the SR 520 bridge replacement was ongoing without any published environmental document and therefore no defined set of improvements were assumed. Since then, the two following studies both assumed some form of a new SR 520 facility. Further demonstrating the complexity in comparing the results from these studies, the I-90 Center Roadway Study did not any assume a form of congestion pricing, while the East Link project includes SR 520 tolling general-purpose vehicles and two-person HOV. This is based on the recent SR 520 Draft EIS, which assumes tolling on SR 520; this tolling has been incorporated into East Link's project assumptions.

Between the Center Roadway Study and the East Link Project, not only are the SR 520 tolling strategies different, but also the assumed use of the I-90 HOV lanes and travel demand modeling approaches vary. The East Link Project technically assume for the traffic analysis that Mercer Island residents would be eligible to use the HOV lanes between Seattle and Mercer Island with light rail in the reversible center roadway. Also while the two studies use the Puget Sound Regional Council travel demand model, the Sound Transit East Link project incorporates the latest PSRC model update available when the analysis began in 2007, and the project's transit usage is derived from Sound Transit's transit ridership model. Review the table (Table H-1) below for a further list of key assumptions and methods between each of these three studies.

TABLE H-1
Comparison of I-90 studies

	I-90 Two Way Transit and HOV Operations Project	**Center Roadway Study**	**East Link Project**	**Comments**
Analysis Parameters				
Demand Model(s)	PSRC, 2001	PSRC, 2005	PSRC, 2006 and Sound Transit Ridership Model	Each study utilized the most recent model versions from the PSRC.
Software Tools	FREQ	VISSIM	VISSIM	
I-90 Study limits	Bellevue Way to I-5 (WB) I-5 to I-405 (EB)	Western terminus to east of I-405	Western terminus to east of I-405	
Analysis Years	2005/2025	2005/2015/2030	2007/2020/2030	
Analysis Periods	AM and PM Peak Hour	AM and PM Peak Periods	AM and PM Peak Periods	
Project & Traffic Assumptions				
SR 520	No capacity expansion	6 lane facility	6 lane facility with tolling	
I-405	No capacity expansion	TPA and Nickel Projects	TPA and Nickel Projects	
I-90 HOV Eligibility	2+ persons until 2025 when 3+ persons. Alternative R8A would remain 2+ persons.	2+ persons	2+ persons and Mercer Island residents in Build (light rail) alternative only	For East Link Project, the traffic analysis assumed Mercer Island single occupant vehicles would be able to use the HOV lanes in both directions of I-90 between Seattle and Island Crest Way to demonstrate that it does not affect the results of the East Link analysis and represents a worst case condition. This assumption does not represent approval of SOVs using the outer roadway HOV lanes or the eastbound left-side off-ramp to Island Crest Way. Any changes to the HOV lane eligibility such as tolling or managed lanes or Mercer Island single occupant vehicle use would be addressed in a future analysis, approval and agreement.
Key I-90 Operations Measures of Effectiveness				
	- Density/Level of Service - Travel Times - Person Throughput - Duration of Congestion	- Travel Time (by modes) - Vehicle Throughput	- Travel Time (by modes) - Person and Vehicle Throughput and Capacity - Density/Level of Service	As these studies have different purposes, the measures of effectiveness changed. Comparable results are documented below.

TABLE H-1
Comparison of I-90 studies

	I-90 Two Way Transit and HOV Operations Project	Center Roadway Study	East Link Project	Comments
Key Results				
2030 AM and PM Hour I-90 Vehicle Throughput (across Lake Washington)	N/A	Non-Exclusive: AM Peak: 12,200 PM Peak: 12,900 Exclusive: AM Peak: 11,100 PM Peak: 11,900	No-Build: AM Peak: 13,900 PM Peak: 14,450 Build: AM Peak: 13,550 PM Peak: 13,550	There is about a 15 percent difference in throughput between the two studies. This is attributed to the different HOV lane assumptions and SR 520 tolling. For comparison purposes, the differences between the Non-Exclusive to Exclusive and No-Build to Build conditions in the two studies are similar. This measure only compares vehicles because person throughput was not analyzed for the Center Roadway Study. Based on the East Link analysis, person throughput is higher in both AM and PM peak periods with the Build alternative. Westbound and eastbound throughput is combined in these values.
2030 General-Purpose Travel Times between Seattle and Eastgate (in minutes)	R8A Alternative: AM Peak: 9 / 10 (WB/EB) PM Peak: 12 / 9 (WB/EB)	Non-Exclusive: AM Peak: 35 / 12 (WB/EB) PM Peak: 38 / 10 (WB/EB) Exclusive: AM Peak: 41 / 16 (WB/EB) PM Peak: 38 / 12 (WB/EB)	No-Build: AM Peak: 25 / 21 (WB/EB) PM Peak: 29 / 19 (WB/EB) Build: AM Peak: 22 / 20 (WB/EB) PM Peak: 23 / 17 (WB/EB)	Travel times between the Center Roadway study and East Link vary as assumptions and existing data and software calibration techniques vary. A factor contributing to travel time differences is the location of the ends points where the travel times are measured from. The largest difference between the two studies is in the eastbound direction where the study limits in East Link are slightly over 1.75 miles longer than in the Center Roadway Study. It was also assumed that Mercer Island traffic would be eligible to use the HOV lane in the East Link project which would provide some travel time improvements for the general-purpose. Travel times for the I-90 Two-Way transit and HOV project are for 2025.

MEMORANDUM AGREEMENT

City of Seattle
City of Mercer Island
City of Bellevue
King County
Metro
Washington State Highway Commission

December, 1976

MEMORANDUM AGREEMENT

WHEREAS, the cities of Seattle, Mercer Island and Bellevue; the Municipality of Metropolitan Seattle (hereinafter "Metro"); and King County by and through their respective councils and the Washington State Highway Commission (hereinafter "the Commission") desire to resolve the disputes which have surrounded the plans to construct an improved Interstate 90 (I-90) facility between Interstate 405 (I-405) and Interstate 5 (I-5); and

WHEREAS, there is a desire to create an environment of cooperation in which agreement is reached among all parties concerned relative to the design of the I-90 facility and related transportation projects; and

WHEREAS, the decisions of the Ninth Circuit Court of Appeals of the United States District Court for the Western District of Washington have required that all alternatives to the proposed highway be studied; and

WHEREAS, all parties hereto state that they have reviewed the proposed highway development and all currently available alternatives to it, including the option of withdrawal and substitution; and

WHEREAS, the I-90 facility from I-405 to I-5, when constructed, must contain all of the social and environmental amenities included in the Commission's previously adopted plans and modifications thereof contained in the Findings and Order of the Board of Review in order to be acceptable to all jurisdictions; and

WHEREAS, the parties believe that construction of the agreed upon I-90 facility will be of definite advantage to all four local jurisdictions because it will provide an excellent transit way between Seattle, Mercer Island and Bellevue; it will eliminate the dangerous three-one reversible lane operation presently employed in that corridor; it will provide improved truck access from the east to Seattle's south industrial/commercial area and port; it will provide improved capacity in the off-peak direction; it will probably provide an improved facility sooner than other approaches; it will provide access to and from I-90 and I-5 south of downtown Seattle eliminating traffic presently going through Beacon Hill residential areas; it will provide many jobs for our citizens during the period of construction; and it will repair the corridor and help knit together the communities now split by U.S. 10 west of the Mount Baker ridge and across Mercer Island; and

WHEREAS, the parties have concluded that withdrawal and substitution is not a desirable option because it would double the local matching monies required and because Mercer Island and Seattle find unacceptable a major highway/transit I-90 facility without extensive environmental amenities which amenities might not be funded under the withdrawal and substitution alternative; and

WHEREAS, it is in the best interest of the citizens of the Puget Sound area and the State of Washington that this segment of I-90 be completed in an expeditious manner; and

WHEREAS, all jurisdictions believe that sufficient public hearings have been held on the project and that no further hearings should be held unless legally required; and

WHEREAS, the parties desire to identify and establish a reasonable assurance of construction of certain priority public transportation facilities which are contained in the 1990 Transportation System Plan for the Central Puget Sound Region and which serve to ensure that I-90 functions as an integral part of the region's transportation system; and

WHEREAS, the parties desire to ensure that these future improvements are consistent with the goals and policies for regional development presently under consideration by the Puget Sound Council of Governments (hereinafter "PSCOG") and the subsequent subregional land use element of the Regional Development Plan for the Central Puget Sound Region;

NOW THEREFORE, in consideration of the mutual and reciprocal benefits accruing to each of the parties hereto, it is hereby agreed as follows:

1. The Cities of Seattle, Mercer Island and Bellevue; King County; Metro and the Commission support the construction of a facility which will accommodate no more than eight motor vehicle lanes which are arranged in the following general manner:
   (a) Three general-purpose motor-vehicle lanes in each direction shall be constructed between the South Bellevue Interchange and I-5. In addition, there will be provision for necessary weaving lanes and possible local access across the East Channel, to be determined in accordance with paragraph 1(e) below.

(b) The facility shall also contain provision for two lanes designed for and permanently committed to transit use. The eastern and western termini for these lanes shall be designed to facilitate uninterrupted transit and carpool access to downtown Seattle and to downtown Bellevue in accordance with paragraph 3 hereinbelow. The design shall be such as to accommodate the operation of the two transit lanes in either a reversible or in a two-way directional mode.

(c) The facility shall be designed in a manner which, as much as practicable, minimizes the width of the roadway and the taking of land.

(d) To the extent practical, the facility shall provide priority by-pass access for local transit to the general purpose motor-vehicle lanes.

(e) The parties agree that the transit lanes shall operate initially in a two-way directional mode, at no less than 45 mph average speed, with the first priority to transit, the second to carpools, and the third to Mercer Island traffic. In the direction of minor flow, the transit lane shall be restricted to busses. The parties further agree that the initial operation of the East Channel bridge shall consist of only three general purpose auto lanes in each direction in addition to the transit lanes. In addition, there will be an acceleration lane from the South Bellevue Interchange which will terminate prior to the exit ramp at the East Mercer Interchange. The subsequent mode of operation of the facility shall be based upon existing needs as determined by the Commission in consultation with the affected jurisdictions, pursuant to paragraph 14 of this agreement. That determination will consider efficient transit flow, equitable access for Mercer Island and Bellevue traffic, and traffic-related impacts on Seattle.

2. The I-90 facility shall be designed and constructed so that conversion of all or part of the transit roadway to fixed guideway is possible.

3. The parties recognize that the planning, design and construction of efficient access at the eastern terminus and western terminus of this facility will enhance the operation of I-90 as a regional transportation facility. Therefore, the Commission, jointly with Seattle, Mercer Island, Bellevue, King County, and Metro, as their respective interests and responsibilities may dictate, shall immediately upon execution of this agreement undertake the development of the necessary plans and designs for, and shall further proceed, with

the required public hearings and the preparation of the necessary environmental impact statements in order to obtain maximum eligibility for Federal Interstate funding for the construction of the following projects:

(a) Transit access from I-90 to downtown Seattle:

(b) Transit access from I-90 to I-405 and to the Bellevue central business district;

(c) Transit and general-purpose access from I-90 to the King County Stadium area; and

(d) Transit and general-purpose access from I-90 to arterials serving the north Duwamish industrial/commercial area and the Seattle waterfront;

(e) Transit access from I-90 transit lanes to I-5;

For any of the above projects or portions thereof which are not eligible for Federal Interstate funding, the Cities, the County and Metro with full support of the Commission, shall seek any available funding for such projects and shall make reasonable effort to complete the construction thereof prior to the completion of I-90.

4. The parties further agree, except as otherwise provided in this agreement, that the modified design of the facility will preserve and incorporate all of the provisions for community amenities and for reducing adverse environmental impacts as contained in limited access plans adopted by the State Highway Commission for

(a) the segment of I-90 from the West Shore of Mercer Island to the East Channel Bridge and for

(b) the segment from I-5 to the West Shore of Mercer Island (modified by the Findings and Order of the Board of Review dated March 26, 1973, and the Stipulation to Resolve Certain Issues incorporated therein, including but not limited to the provisions for a full lid tying affected Seattle neighborhoods together. The lid shall be constructed to permit park and/or two-story residential or business construction (not industrial uses) to take place on top of the highway between the Mt. Baker tunnel and 23rd Avenue South. Additional loads may be acceptable following specific agreement between the Commission and the City of Seattle. The Commission agrees to fund the landscaping of the lid and the maintenance thereof except as may be agreed to by other parties.

5. The parties agree that the design of the entire facility shall include the following additional features:

(a) a transit station permitting transfer of transit passengers at Empire Way South or 23rd Avenue South as more particularly set forth in the Findings and Order of the Board of Review.

(b) a direct Highway connection for Rainier Valley to and from the east.

(c) the Commission's plan for preserving access between Seattle communities over adjacent local city streets shall include improvements of South Norman Street between 20th Avenue South and 23rd Avenue South to provide access to the Judkins neighborhood, this being done in lieu of the development of South Judkins Street as provided in the Commission's adopted plan as modified by the Findings and Order of the Board of Review.

(d) a continuous park/pedestrian link between Judkins Park and the lid over I-90 west of the Mt. Baker Ridge Tunnel.

6. The Commission agrees to participate jointly with the City of Seattle in an I-90 corridor area planning study for the purpose of designing alternative means of redeveloping areas adjacent to the I-90 project in Seattle. The extent of such study shall be defined and agreed to by Seattle and the Commission, and to the extent that the study relates to the effects of the I-90 facility in the corridor, it shall be funded by the Commission.

7. At the option of the local jurisdictions to be exercised within a reasonable time, the Commission shall transfer to the appropriate jurisdiction fee title of all state-purchased lands acquired for the I-90 project but which are outside the finally determined right-of-way lines of I-90 to the fullest extent and at the lowest cost legally possible.

8. The parties hereto agree that they will proceed under established legal processes, including regional transportation planning procedures of PSCOG and consistent with the approved Regional Development Plan of PSCOG, to determine those projects which are of highest priority in the Transportation System Plan and the Transportation

Improvement Program as the Plan and Program apply to the King County subregion. The parties hereby agree that projects (a) through (g) listed below are of highest priority and shall so indicate in the process of establishing the King County Subregional Transportation Improvement Program, the Regional 1990 Transportation System Plan, and Metro's Comprehensive Public Transportation Plan. The Commission and Metro shall work with the local jurisdictions in undertaking location and design studies for these projects at the earliest possible date commensurate with state, regional, metropolitan and local planning and priority programming practices. Projects to be considered through these processes shall include, but not be limited to, the following regional components of PSCOG 1990 Transportation Plan:

(a) Transit/carpool lanes and/or Surveilance Control and Driver Information Systems (SC&DI) on I-5 from I-405 at Tukwila to the King County Snohomish County line:

(b) The park-and-ride lots and flyer stops contained in the approved 1980 Plan as may be modified by Metro:

(c) Provision for a busway or exclusive transit/carpool lane(s) as a part of the SR 99 and SR 509 corridor including a crossing of the First Avenue South Bridge, consistent with Metro's transition planning for this corridor;

(d) Provision for a busway or exclusive transit/carpool lane(s) and/or SC&DI as a part of SR 520 from I-5 to I-405;

(e) Redesign, in a manner acceptable to the City of Seattle, of the lanes where SR 520 meets I-5 and at the Mercer Street egress from I-5 in order to improve transit flow and reduce the congestion on I-5 between Mercer Street and Roanoke Street;

(f) Provision for a busway or exclusive transit/carpool lane(s) and/or SC&DI as a part of I-405 from Bothell to Renton

(g) Provision for exclusive transit lane(s) on I-405 through Bellevue which shall also include provision for a freeway flyer stop and a park-and-ride facility on I-405 between Main Street and N.E. 8th in Bellevue and provision for I-405 access improvements to the Bellevue central business district as determined by the Joint State Legislative/Highway Commission and City of Bellevue I-405 Access Study.

9. The parties agree that the I-90 facility should be operated in such a manner as to encourage growth and development in the presently urbanized areas of King County rather than in undeveloped areas. Therefore, the Commission shall conduct a study in coordination with the parties to this agreement to determine the feasibility and means of metering and controlling local access to I-90 east of Bellevue during peak hours.

10. Seattle, Bellevue, Mercer Island, King County and Metro agree that dedicated public transit rights-of-way through downtown Seattle and through downtown Bellevue are compatible with the public transportation plans of this area and are desirable to be implemented in conjunction with the completion of the I-90 facility.

11. Immediately upon the issuance of the environmental impact statement, another review team comprised of representatives chosen by each of the parties to this agreement shall be established to further monitor and advise the Commission on the development of the design and the implementation of the entire I-90 facility and the I-90 transit access provisions listed in paragraph 3 above. In addition, review teams including elected officials and citizens from Seattle, Bellevue, Mercer Island and King County may be established to further monitor and advise the Commission upon the implementation and design of the I-90 facility.

12. Upon execution of this agreement, the Commission becomes responsible for the design and construction of the facilities described in this agreement that can be funded with federal interstate funds as well as any other facilities referred to in this agreement for which the Commission, by law, has the sole responsibility; and the several parties to this agreement become responsible for the design and construction of the remaining facilities referred to in this agreement; provided that all such undertakings are subject to available funding and legal and procedural requirements. Seattle,

Bellevue, Mercer Island, King County and the Commission agree to process any permits required for construction of the agreed upon facilities in a timely and expeditious manner, as provided by law.

13. It is expressly understood that agreement to the above by the Commission is tentative pending review of (1) the final environmental impact statement to be filed in connection with the project and (2) the hearing record being prepared in connection with the corridor-design hearing held in January and February 1976. It is also understood that the parties have reached this agreement under the assumption and on the condition that the funding for the project, in accordance with the modified design of said project as referred to in paragraphs 1, 2 and 4 and those eligible portions under paragraph 3 which will qualify for Federal Aid Interstate monies, is approved prior to the initiation of construction and shall be funded from federal and state funds, except as agreed to by the affected jurisdiction(s).

14. This agreement represents substantial accommodations by the parties of positions held heretofore. Such accommodations were made in order to achieve a unanimous agreement upon which to proceed with the design and construction of I-90 and related projects. This agreement, therefore, sets forth the express intent of the existing governing bodies that the parties to this agreement understand that their respective governing bodies are limited in the degree to which they can bind their successors with respect to the exercise of govern-

mental powers vested in those governing bodies by law. Accordingly, the Commission will take no action which would result in a major change in either the operation or the capacity of the I-90 facility without prior consultation with and involvement of the other parties to this agreement, with the intent that concurrence of the parties be a prerequisite to Commission action to the greatest extent possible under law.

AMENDMENT To The I-90
MEMORANDUM AGREEMENT

AUGUST, 2004

Central Puget Sound Regional Transit Authority
City of Bellevue
City of Mercer Island
City of Seattle
King County
Washington State Transportation Commission

August 2004
Amendment to 1976 Memorandum Agreement

WHEREAS, the Cities of Seattle, Mercer Island, and Bellevue; King County; by and through their respective governing bodies and the Washington State Transportation Commission (hereinafter "the Commission") desire to amend the existing Memorandum Agreement (the Agreement) signed by all parties in 1976 to reflect current and future conditions and demands along the Interstate 90 (I-90) corridor between Bellevue and Seattle crossing Lake Washington via Mercer Island (the "I-90 Corridor"), including increased travel growth, changes in travel patterns, and a reduction in transit reliability; and

WHEREAS, there is a desire among the parties and Sound Transit to add Sound Transit as the Regional Transit Authority with responsibility for High Capacity Transit as a signatory to this 2004 Amendment, but not to the underlying 1976 Agreement, given its role in the region generally and the I-90 Corridor specifically; and

WHEREAS, all parties recognize the I-90 facility as a key interstate corridor connecting the East and West Coasts, Eastern and Western Washington, and recognize its importance as a critical link between major urban centers in King County, and the only means of mobility to and from Mercer Island; and

WHEREAS, all parties acknowledge I-90 as a critical transportation link vital to the economy of the region and the state by providing for the movement of people and goods within the region; and

WHEREAS, all parties agree that the current configuration and operation of I-90 between Bellevue, Mercer Island, and Seattle does not address today's demands and expected growth in the region; and a new configuration that helps move more people and goods is imperative to manage congestion on what is the busiest east-west corridor in the region; and

WHEREAS, all parties recognize the importance of the environment and thereby seek to preserve and enhance its quality; and

WHEREAS, all parties agree that the ultimate configuration for I-90 between Bellevue, Mercer Island, and Seattle should be defined as High Capacity Transit in the center roadway and HOV lanes in the outer roadways; and further agree that High Capacity Transit for this purpose is defined as a transit system operating in dedicated right-of-way such as light rail, monorail, or a substantially equivalent system; and

WHEREAS, all parties agree to work cooperatively to secure funding at local, regional, state, and federal levels to fully fund both parts of the ultimate configuration of the "I-90 Corridor" (HOV lanes on the outer roadway and High Capacity Transit in the center roadway); and

WHEREAS, all parties have studied many alternatives as participants on the Steering Committee for Sound Transit and the Washington State Department of Transportation's (WSDOT) I-90 Two-Way Transit and HOV Operations Project (Project), and all parties agree that building HOV lanes on the outer roadways as identified as Alternative R-8A as set forth in the April 25, 2003 Draft Environmental Impact Statement (DEIS) prepared for the project, is an essential first step toward achieving the ultimate configuration; and

WHEREAS, all parties acknowledge that the ultimate configuration is consistent with the region's transportation action plan, Destination 2030, which focuses on integrated multi-modal transportation systems; describing facilities that weave parts of the region together by crossing county or city boundaries or access major regional activity centers as critical to the region's transportation system; and specifically calls for safety, maintenance, and capacity investments on I-90 between I-5 and I-405; and high capacity transit in the "I-90 Corridor" between Seattle and Bellevue; and

WHEREAS, all parties agree that I-90 is an integral piece of the regional bike network, providing the only bicycle-pedestrian path across Lake Washington; that the preferred alternative maintains a ten foot bicycle lane as part of providing optimal multi-modal travel in the I-90 corridor for cyclists and pedestrians; and

WHEREAS, the Cities of Bellevue, Mercer Island, and Seattle; King County; Sound Transit, and the Washington State Transportation Commission, as participants of the I-90 Steering Committee, having conducted a thorough evaluation of the performance and benefits of the alternatives, agree that Alternative R-8A has been shown to improve regional mobility by providing reliable and safe two-way transit and high occupancy vehicle operations on I-90 between Bellevue, Mercer Island, and Seattle, and mobility for Mercer Island, while minimizing impacts to the environment, to other users, and to other transportation modes; and is an essential first step toward implementing High Capacity Transit in the I-90 corridor;

NOW THEREFORE BE IT RESOLVED, the parties to this 2004 Amendment agree to the following principles regarding future development of the I-90 Corridor between Seattle and Bellevue:

1. Alternative R-8A with High Capacity Transit deployed in the center lanes is the ultimate configuration for I-90 in this segment;
2. Construction of R-8A should occur as soon as possible as a first step to the ultimate configuration;
3. Upon completion of R-8A, move as quickly as possible to construct High Capacity Transit in the center lanes;
4. Commit to the earliest possible conversion of center roadway to two-way High Capacity Transit operation based on outcome of studies and funding approvals.
5. Minimize construction impacts to the existing bicycle/pedestrian path, and maintain safe access to the path during construction;

6. Maintain the existing width of the bicycle/pedestrian path and to install screen treatments to create a safe barrier between the path users and vehicular traffic; and
7. To the extent of any loss of mobility to and from Mercer Island based on the outcome of studies, additional transit facilities and services such as additional bus service, parking available for Mercer Island residents, and other measures shall be identified and satisfactorily addressed by the Commission, in consultation with the affected jurisdictions pursuant to paragraph 14 of the Agreement, prior to the time the center roadway converts to High Capacity Transit.

STATE OF WASHINGTON

December 22, 2006

The Honorable Bryan Cairns, Mayor
City of Mercer Island
9611 SE 36th Street
Mercer Island, WA 98040

Dear Mayor Cairns:

Thank you for your letter of November 13 concerning access for single occupancy vehicles from Mercer Island to the HOV lane on I-90 after conversion of the center roadway to high capacity transit.

The Governor's Office and the Washington State Department of Transportation intend to honor our understanding of the agreement reached by the signatories regarding Mercer Island access to HOV lanes. We have concluded that when the center roadway is converted to high capacity transit, Mercer Island residents should be permitted HOV lane access until the HOV lanes are converted to high occupancy toll (HOT) lanes or another tolling regimen. It is important to emphasize that we do not know how long the lanes would operate as HOV lanes, and it is possible that those lanes may be operated as tolled lanes from the time of or even before the conversion of the center roadway occurs.

We would also note that other issues apart from Mercer Island considerations are involved in HOV lane access for Mercer Island. An equitable outcome must take into account the reasonable expectations of all the users of the corridor, including users of transit and other high occupancy vehicles who must be assured that the lane meets performance standards. In addition, the access and mobility opportunities provided for Mercer Island residents include new high capacity transit uses of the corridor as well as the private passenger vehicle uses.

Thank you again for your letter. Please let us know if you have additional questions or concerns.

Sincerely,

Douglas B MacDonald

Tom Fitzsimmons, Chief of Staff

Ms. Paula J. Hammond
Secretary of Transportation
Department of Transportation
Olympia, Washington

Attention: Barb De Ste Croix

**Sound Transit – I-90 East Link Project
Final Interchange Justification Report**

Dear Ms. Hammond:

This letter is in response to your June 20, 2011, request for a finding of engineering and operational acceptability for the Sound Transit I-90 East Link Interchange Justification Report (IJR). The project, in part, incorporates interchange modifications and closures within the I-90 center roadway to allow Sound Transit's East Link light rail project to use the I-90 reversible express lanes from MP 1.99 to MP 9.44. In addition, part of this project, incorporates comprehensive changes to I-90, including HOV access and lane modifications resulting from the I-90 Two-Way Transit and HOV Operations Project that form the ultimate configuration of I-90 between the cities of Seattle and Bellevue. We have compared the final IJR to previous drafts and find that it satisfies the requirements of the FHWA Interstate Added Access Policy.

Based on an engineering and operations review, the access request is considered acceptable. However; the general purpose left-hand on ramp connecting Island Crest Way to the WB I-90 HOV lane is a safety issue. The AASHTO Greenbook, ***A Policy on Geometric Design of Highways and Streets,*** discourages the use of left-hand on and off ramps. This access point should be monitored and closed to single occupant vehicles use if significant collision frequency and severity begin to occur. In addition, ramp metering must continue at this location.

If there are no major changes in the design of the proposal, final approval may be given upon the completion of the environmental process. Please submit a request for final IJR approval at the completion of the NEPA process.

Sincerely,

DANIEL M. MATHIS, P.E.
Division Administrator

Appendix A

Best Management Practices for Sensitive Ecosystem Resources

Appendix A

Best Management Practices for Sensitive Ecosystem Resources

The following list of measures is a compilation of best management practices (BMPs) that can be used to avoid and minimize temporary construction and permanent operational impacts of the East Link project on sensitive ecosystem resources. These BMPs are either required by state or federal agencies to obtain permits required for the project or may be required to comply with typical permit conditions. They are based on Sound Transit's knowledge of permit requirements and experience with conducting environmental compliance and permitting for numerous other projects in the Puget Sound area.

Construction-Related BMPs

General BMPs for All Sensitive Areas

The project would delineate construction limits for vegetated and habitat areas that may be disturbed during construction. The intent is to prevent unintended impacts on riparian vegetation, wetlands, woodlands, and other sensitive sites outside of the construction limits. The construction limits would be clearly marked with high-visibility construction fencing prior to any ground-disturbing or construction-related activities. There would be no direct site disturbance outside of the construction limits.

Soil or rock stockpiles, excavated materials, or excess soil materials would be prevented from eroding into sensitive habitats, including stream channels, wetlands, and riparian areas outside of the construction limits by high water or storm runoff. Sound Transit or its construction contractor would develop a Temporary Erosion and Sediment Control plan that would be implemented during construction. This TESC plan would address potential erosion during construction. The contractor would implement the plan before discharging or allowing runoff from the site. Monitoring requirements specified in the TESC would provide feedback to make sure that the erosion control practices are operating properly and effectively. BMPs would be implemented to limit soil compaction in sensitive areas.

Fish and Aquatic Habitat Protection

All work would comply with the terms and conditions set forth in the Hydraulic Project Approval (HPA) issued for the project by the Washington Department of Fish and Wildlife (WDFW). The HPA program is the vehicle through which WDFW regulates activities that affect the bed or flow of waters of the state for the protection of fish life. An HPA is required for construction or structural work associated with any bridge structure or culvert construction within or below the ordinary high water mark (OHWM) of waters of the state.

Seasonal restrictions (i.e., work windows) applied to work conducted below the OHWM would be as required by an HPA issued by WDFW and by the Section 404 permit issued by the U.S. Army Corps of Engineers (USACE).

In accordance with typical requirements of an HPA, when large woody debris must be moved to allow the reasonable use of an over-water or in-water facility, the large woody debris would be returned to the water downstream, where it would continue to provide aquatic habitat function.

All newly installed culverts would be in compliance with Washington Administrative Code (WAC) 220-110-070 (http://wdfw.wa.gov/hab/engineer/w2201170.htm) regarding fish passage requirements. Any affected streambeds, stream banks adjacent to culverts, and at the stream relocation reach, would be permanently restored after in-water work with plantings of native or approved woody and herbaceous species within one year of completion of each phase of construction. Bank protection would follow the guidelines set forth in WDFW's *Integrated Streambank Protection Guidelines* (http://wdfw.wa.gov/hab/ahg/ispgdoc.htm).

Water Quality

The federal Clean Water Act (CWA) (1972, and later modifications, 1977, 1981, and 1987) established water quality goals for the navigable (surface) waters of the United States. One of the mechanisms for achieving the goals of the CWA is the National Pollutant Discharge Elimination System (NPDES) permit program, which is administered by the U.S. Environmental Protection Agency (EPA). EPA has delegated responsibility to administer the NPDES permit program to the State of Washington on the basis of Chapter 90.48 of the Revised Code of Washington (RCW), which defines the Washington State Department of Ecology (Ecology) authority and obligations in administering the wastewater discharge permit program.

Ecology's construction stormwater general permit is required for certain construction activities. The goal of the permit is to reduce or eliminate stormwater pollution and other impacts on surface waters from construction sites.

The project must complete a Notice of Intent (NOI) for coverage under the permit. The project must also develop a Stormwater Pollution Prevention Plan that implements BMPs for identifying, reducing, eliminating, or preventing sediment and erosion problems on site.

Any materials placed below the OHWM (e.g., cobble or boulders for energy dissipation at culvert ends, streambed gravel or other substrates) would be relatively clean and handled in a way to minimize turbidity. Methods would be used such that it is not expected the project would exceed state water quality standards at the point of compliance (WAC chapter 173-201A) when flow is restored to the work site. To the fullest extent practicable, culverts would be installed, modified, and/or replaced in isolation from stream flow (if there is flow during the work window) by means of a temporary bypass flume, diversion culvert, or by temporarily pumping flow around the in-water work zone. Any temporary dewatering of the in-water work zone would be preceded by work area isolation and fish removal/relocation (as necessary). Fish handling would be conducted by a trained and qualified biologist. Turbid water produced during the course of in-water work would be prevented from discharging to fish-bearing waters or wetlands. Turbid wastewater may be routed to temporary or permanent detention facilities, or to upland areas that provide adequate rates of infiltration.

In accordance with conditions of a typical HPA, heavy equipment used during the course of in-water work would operate from above the OHWM wherever possible. Use of equipment below the OHWM would be limited to that necessary to gain position for work. Drive mechanisms would not enter or operate below the OHWM, except under the terms of the HPA issued by WDFW.

Uncured concrete and/or concrete byproducts would be prevented from coming in contact with streams or water conveyed directly to streams during construction. Any water having direct contact with uncured concrete would be contained and treated or removed from the site (as appropriate) to prevent discharge to streams or wetlands.

Installation of permanent footings and all drilled or pile-driven shafts (and excavated spread footings) below the OHWM (e.g., for culvert endwalls) would be conducted in a manner consistent with Section 404 and other permits issued for the project by the USACE and other parties (as applicable). When constructing drilled shafts, the contractor would ensure that all drilling equipment, drill recovery and recycling pits, and any waste or spoil produced are properly contained to prevent discharge of drill wastes or fluids to any surface water or wetlands.

In accordance with typical Section 401 permit requirements, turbidity would be monitored if in-water work occurs when water is flowing in the streams. Equipment (excluding track-mounted equipment, large cranes, and other relatively immobile equipment) would be refueled and maintenance activities conducted at a distance from the nearest wetlands, ditches, and flowing or standing water approved by regulatory permits. Appropriate spill prevention measures and fuel containment systems would be designed and implemented to completely contain a potential spill as specified in the Spill Prevention and Control Countermeasure plan. If flooding of the work area is expected to occur within 24 hours, all equipment and material would be evacuated from near-stream construction sites. An exception would be for efforts to avoid or minimize resource damage. All equipment that is used for in-stream or in-wetland work would be cleaned prior to operations below the OHWM. Wash-water would not be discharged directly into any water body without pretreatment.

Weed Control

If herbicide use is required during the monitoring period, the type and application of the pesticide should be chosen based upon City of Seattle Tier Tables (http://www.seattle.gov/environment/Pesticides.htm) or other locally accepted methodology. Additionally, Sound Transit's Integrated Pest management Plan (IPM) would provide guidance regarding pesticide use and IPM practices.

Design and Operation BMPs

The project would install permanent storm water runoff treatment and flow control facilities where needed according to the requirements of the 2004 Ecology *Stormwater Management Manual for Western Washington* or the most recently adopted manual.

The project would incorporate stormwater conveyance and management facilities that promote infiltration where applicable.

The project would select, design, and install runoff treatment BMPs that are best suited to the site conditions and best capable of achieving the required levels of treatment (subject to negotiation with the local jurisdiction and/or Ecology). These would or may include natural or engineered dispersion BMPs; biofiltration BMPs such as vegetated filter strips, biofiltration swales, or ecology embankments; wet-pool BMPs; and infiltration BMPs.

The project would not reroute existing drainage configurations to the extent that stormwater from one basin or subbasins is conveyed and discharged to another.

The project would implement IPM techniques, in accordance with current Ecology water quality agreements, to minimize the impact on aquatic and terrestrial environments.

Appendix B

Wildlife Function Field Data Form

Sound Transit East Link Wildlife Functions Field Data Form

(Adapted from WSDOT's Best Professional Judgment [BPJ] Characterization)

Project: ____________________ Date: ____________________

Site ID: ____________________ Biologist: ____________________

Function	Likely or Not Likely to Provide (State Your Rationale), Yes/No, or Number
F. General Habitat Suitability	
1. Area is not fragmented by development.	
2. Upland surrounding area is undeveloped.	
3. Area has connectivity with other habitat types.	
4. Diversity of plant species is high.	
5. Evidence of wildlife use, e.g., tracks, scat, gnawed stumps present.	
6. Distance to disturbance source and type.	
H. Habitat for Amphibians	
1. Cover (i.e., woody debris, rocks, and leaf litter) present.	
2. Woody debris present within area.	
3. Proximity to wetland habitats – distance and type.	
4. Lands within 1 km (0.6 mi) of area are > or = 40% undeveloped.	
5. Wetlands and/or an intermittent or perennial stream within 1 km (0.6 mi) of area.	
6. Presence of movement barrier between above wetland or stream and site being evaluated	
I. Habitat for Mammals	
1. Permanent water present within the area.	
2. Presence of emergent vegetation in areas of permanent water.	
3. Areas containing dense shrubs and/or trees are present.	
4. Interspersion between different strata of vegetation.	
5. Presence of slopes / banks suitable for denning.	
6. Evidence of wildlife use, e.g., dens, tracks, scat, gnawed stumps, etc.	
J. Habitat for Birds	
1. Forested and scrub-shrub classes present within the area.	
2. Average tree height.	
3. Average DBH.	

Function	Likely or Not Likely to Provide (State Your Rationale), Yes/No, or Number
4. Largest DBH and percent of trees in this class.	
5. Relative tree species diversity (L, M, H).	
6. Snags present in area.	
7. Cavities present in trees.	
8. Tree % canopy estimate.	
9. Shrub % canopy estimate.	
10. Adjacent area contains relatively undisturbed grassland or wetland shrub and/or forest habitats.	
11. Lands within 1 km (0.6 mi) of the area are greater than or = 40% undeveloped.	
L. Native Plant Richness	
1. Dominant and co-dominant plants are native.	
2. Area has three or more strata of vegetation.	
3. Area has mature trees (conifer, deciduous?).	
4. Number of species of trees.	
5. Area has well developed shrub layer.	
6. Number of species of shrubs.	
N. Uniqueness and Heritage	
1. Area contains documented occurrence of a state or federally listed threatened or endangered species.	
2. Area contains documented critical habitat, high quality ecosystems, or priority species respectively designated by the USFWS, the WDNR's NHP, or WDFW's Priority Habitats and Species Program.	
3. Area has biological, geological, or other features that are determined rare by the local jurisdiction.	
4. Area has been determined significant by the local jurisdiction because it provides functions scarce for the area	

Appendix C

Priority Species Found in Western Washington and Potential Occurrence in the East Link Affected Habitats

TABLE C-1
Priority Species Found in Western Washington and Potential Occurrence in the East Link Affected Habitats

Common Name	Scientific Name	Family	Federal Status[a]	State Status[b]	Expected Occurrence in Study Area		Preferred Habitat / Basis for Occurrence Determination
					Likely Present	Possibly Present	
Species with Federal Endangered Species Act Status							
Marbled Murrelet	*Brachyramphus marmoratus*	Bird	FT	ST		X	Requires conifer forests with trees >28-inch diameter at breast high (dbh) with platforms for nesting. Spends the winter in marine waters offshore. Rare and infrequent visitors to Lake Washington during the nonbreeding season. There has been only one sighting of marbled murrelets in the project vicinity in the last 50 years and they are not expected to be present in the future.
Taylor's Checkerspot	*Euphydryas editha taylori*	Butterfly	FCo	SoC		X	Parent species Edith's checkerspot (*Euphydryas editha*) listed as occurring in King County. *E. editha taylori* likely does not occur in study area due to a lack of grasslands. *Plantago* is only host plant likely growing in study area. Grasslands in Puget Sound lowlands, San Juans, and Olympic Coast. Larval host plants: paintbrush (*Castilleja*), beardtongues (*Penstemon*), lousewort (*Pedicularis*), owl's clover (*Orthocarpus*), Chinese houses (*Collinsia*), and plantain (*Plantago*).
Federal Species of Concern—No Endangered Species Act Status							
Townsend's Big-eared Bat	*Corynorhinus townsendii*	Bat	FCo	SC		X	Areas with a mosaic of woodland/grassland and/or shrubland, esp. coniferous mosaics. Found in Pierce County, Fort Lewis.
Yuma Myotis	*Myotis yumanensis*	Bat	FCo	NONE		X	Closely associated with water. Moist woodlands, forests, desert scrub. Forages over water and in open, uncluttered habitats. Mapped in Puget Sound.
Western Toad	*Bufo boreas*	Amphibian	FCo	SC	X		Found in a variety of habitats, including slow-moving rivers and streams, and near ponds and lakes. Large population declines in the Northwest. Listed as occurring in the Lake Washington Basin.
Additional Washington Listed Species, and Species of Concern							
Monarch	*Danaus plexippus*	Butterfly	None	SoC	Known in the study		Listed as occurring in King County. Variety of open habitats: fields, meadows, weedy areas, marshes, and along

TABLE C-1
Priority Species Found in Western Washington and Potential Occurrence in the East Link Affected Habitats

Common Name	Scientific Name	Family	Federal Status[a]	State Status[b]	Expected Occurrence in Study Area		Preferred Habitat / Basis for Occurrence Determination
					Likely Present	Possibly Present	
					area		roadsides. Larval and adult food plants are milkweeds.
Bald Eagle	*Haliaeetus leucocephalus*	Bird	FCo	SM	Known in the study area		Nests in wooded areas with larger trees within a half mile of large bodies of water. Highly territorial of nesting tree. May have more than one nest tree per territory, as well as roost and perch trees. Several known territories in Segments A, B, and E.
Peregrine Falcon	*Falco peregrinus*	Bird	FCo	SM	Known in the study area		Two historical and recent eyries in Segment A. Nests in sheltered cliff areas naturally, has adapted to using bridges and buildings for nesting sites.
Pileated Woodpecker	*Dryocopus pileatus*	Bird	None	SC	Known in the study area		Requires wooded forests with a component of dead and dying trees and snags for foraging and nesting. Prefers deciduous forests. Will occur in conifer forests with some deciduous tree component. Found at Marymoor Park. One bird observed in WR-5.
Purple Martin	*Progne subis*	Bird	None	SC	Known in the study area		Nests in structures over waterbodies, including natural cavities, pilings, and man-made housing structures. Forages over open water or wet areas for insects while in flight. Nesting observed at Marymoor Park in 2003, but no activity since. Population believed to be in decline throughout its range.
Common Loon	*Gavia immer*	Bird	None	SS		X	Population has declined due to acid rain, pollution, industrial contamination of waterbodies and lead poisoning. Artificial floating nesting platforms have reduced the negative impact of fluctuating water levels from human activities to nests.
Western Grebe	*Aechmophorus occidentalis*	Bird	None	SC	Known in the study area		Nests in colonies numbering up to several hundred birds on large inland lakes or in coastal marshes of the western United States. Birds breeding in the northern extent of their range migrate to the western coastal ocean to spend the winter.
Merlin	*Falco columbarius*	Bird	None	SC	X		Seen during the nesting season at Marymoor Park.

TABLE C-1
Priority Species Found in Western Washington and Potential Occurrence in the East Link Affected Habitats

Common Name	Scientific Name	Family	Federal Status[a]	State Status[b]	Expected Occurrence in Study Area		Preferred Habitat / Basis for Occurrence Determination
					Likely Present	Possibly Present	
Vaux's Swift	*Chaetura vauxi*	Bird	None	SC		X	Nests and forages in groups with 30 or more birds. Nest is a cup shaped nest placed in a dark, confined cavity. Breeds in mountains and foothills, usually >700 meters in elevation. Forages over wooded areas and more open habitats, including towns.
Olive-sided Flycatcher	*Contopus borealis*	Bird	FCo	SM	X		Breeds in coniferous forests in North America. Population is declining due to loss of winter habitat in Central America and the Andes region of South America.
Willow Flycatcher	*Empidonax traillii*	Bird	FCo	SM	Known in the study area		Breeds in deciduous thickets, especially in willow thickets. Nest site often close to water.

[a] **Federal Status:**

FT=Federal Threatened

FC=Federal Candidate

FCo=Federal Species of Concern (no formal ESA status)

[b] **State of Washington Status:**

The Washington Species of Concern list is published by the Wildlife Management Program and includes only native Washington fish and wildlife species that are listed as Endangered, Threatened, or Sensitive, or as Candidates for these designations. Endangered, Threatened, and Sensitive species are legally established in Washington Administrative Codes.

SE=State Endangered

ST=State Threatened

SC=State Candidate

SS=State Sensitive

SoC=State Species of Concern

SM=State Monitor Species (this is the “lowest level” of species classification afforded to fish and wildlife species in the state of Washington. State Monitor Species are not considered Species of Concern, but are monitored for status and distribution in a particular area.

Appendix D

WDFW-Recommended Management Buffer Distances for Bald Eagles

Appendix D

WDFW-Recommended Management Buffer Distances for Bald Eagles

This information is summarized from the Washington Department of Fish and Wildlife (WDFW) Priority Habitat and Species Management Recommendations for Bald Eagles (Watson and Roderick, 2004).

Nest Area

When developing site management plans, WDFW recommends buffering bald eagle nests with a two-zone management system that mimics a strategy designed by the U.S. Fish and Wildlife Service (USFWS, 1981). The following guidelines for these zones are based on the research cited in WDFW's Priority Habitat and Species Management Recommendations for bald eagles (Watson and Roderick, 2004):

- Protected Zone (Primary Zone). This zone protects and screens the nest tree and should extend at least 400 feet from the nest tree. Its size and shape will vary with site conditions such as topography, prevailing winds, and screening vegetation, as well as on the eagles' tolerance to human activities. In areas where vegetation and/or topography do not provide adequate screening within 400 feet of the nest, consider increasing the size of the protected zone. Retain all existing large trees and existing forest structure within the protected zone.
- Conditioned Zone (Secondary Zone). The conditioned zone further screens and protects nest sites in the protected zone and should extend from 330 to 800 feet beyond the edge of the protected zone. Alternate nest locations, perch trees, and feeding sites should be included in this zone and will influence its size and shape (Stalmaster, 1987). Depending on screening vegetation, prevailing winds, topography, and the sensitivity of the nesting eagles to human activities, this zone may need to be expanded up to 2,640 feet from the edge of the protected zone. Avoid constructing roads or trails within sight of the nest that would facilitate human or predator access to the nest. Construction activities (e.g., homes, roads, and power lines) that take place out of sight of the nest should be postponed until after the young eagles have fledged, as should forest practice activities.

Roosting Habitat (Communal Roosts)

Activities that produce noise or visual effects within 400 feet of the edges of communal roost trees or staging trees should be conducted outside of the critical roosting period (November 15 to March 15). This corresponds to the time when most eagles begin to arrive in eastern and western Washington, with numbers peaking in December and January and declining rapidly by mid-March (Fielder and Starkey, 1980; Garrett, et al., 1988; Stalmaster, 1989). There are no known communal roosts in the project vicinity.

Perching and Foraging Habitat

Perches along shorelines near winter roosts or in nesting territories are important to foraging eagles. Tree structure, and the distance between habitat alterations and shorelines should be considered when managing for bald eagle wintering habitat.

Perch Structure and Location

In Washington, protect known bald eagle perch trees and potential foraging perches greater than 20 inches diameter at breast height (dbh) and within 246 feet of the top of a bank or shoreline. Chandler et al. (1995) recommend protecting patches of shoreline forest, and specifically protecting live and dead trees over 8 inches dbh for future habitat.

Human Disturbance

Bald eagles often feed on the ground, in open areas where food resources are concentrated. They should be allowed a distance of at least 1,500 feet from human activity and permanent structures. Buffer zones of 800 to 1,000 feet have been recommended in perching areas where little screening cover is present (Stalmaster and Newman, 1978). Stalmaster and Newman (1979) found that 50 percent of wintering eagles in open areas flushed at 500 feet, but 98 percent would tolerate human activities at 1,000 feet. Activities that disturb eagles while feeding, especially during winter, can cause them to expend more energy, which increases their susceptibility to disease and poor health (Stalmaster, 1987).

DATE: February 14, 2008

Introduction

Title 21A of the Growth Management Act (GMA) requires counties and cities in Washington to designate and protect critical areas, in accordance with RCW 36.70A.170. The GMA requires local jurisdictions to designate and protect critical areas, using the best available science (BAS) in developing policies and regulations to protect critical area functions and values. The purpose of the GMA is to avoid the possibility of uncoordinated and unplanned growth as the population in the state continues to rise and development increases. The GMA is intended to protect the public's health and safety by requiring county and city governments to create local based plans and regulations that are centered on land use and natural resource issues as guided by the state legislature. Critical areas are one of the two primary natural resource areas addressed in the GMA planning process. Critical areas include wetlands, critical recharge areas for potable water aquifers, frequently flooded areas, geologically hazard areas, and Fish and Wildlife habitat conservation areas.

Fish and Wildlife Habitat Conservation Areas

Fish and Wildlife habitat conservation areas are the primary way the Washington Department of Fish and Wildlife (WDFW) works to conserve wildlife habitat in Washington State. While WDFW is charged with protecting and maintaining fish and wildlife populations, WDFW has little authority over the habitats used by fish and wildlife species. Protection is primarily achieved through the voluntary actions of landowners and through existing state regulations, including the State Environmental Policy Act (SEPA), the Growth Management Act, the Forest Practices Act (FPA), and the Shoreline Management Act (SMA). WDFW primarily serves an advisory role, by reviewing proposals for development and offering guidelines for species management on private property. WDFW has written management guidelines for all state and priority listed species. Priority species include species and wildlife congregations that are priorities for conservation due to their population status, sensitivity to disturbance, economic, recreational or tribal importance. These species may or may not be listed as an endangered, threatened, sensitive, or candidate species by the state or federal government. The management recommendations are generalized guidelines and are not enforceable regulations. They are based on the needs of fish and wildlife species, and are not based on land use objectives.

Fish and Wildlife Habitat Conservation Areas are lands that are managed for perpetuating species in suitable habitats within their natural range, and to prevent the creation of isolated subpopulations. As set forth in the WAC guidelines, Fish and Wildlife Habitat Conservation Areas include:

a. Areas with which federal and state endangered, threatened, and sensitive species, and state candidate species, have a primary association;

b. Habitats and species of local importance;

c. Commercial and recreational shellfish areas;

d. Kelp and eel grass beds; herring and smelt spawning areas;

e. Naturally occurring ponds under 20 acres and their submerged aquatic beds that

f. Provide fish or wildlife habitat;

g. Waters of the state;

h. Lakes, ponds, streams, and rivers planted with game fish by a governmental or tribal

i. Entity; or

j. State natural area preserves and natural resource conservation areas.

In order to meet the requirements established by the GMA, King County and the Cities of Bellevue, Mercer Island and Redmond created Critical Areas Ordinances to ensure the management and protection of lands used by listed and locally important species. Species of Local Importance include native species that are in danger of becoming federally or state listed or extirpated if current population trends continue. The long-term preservation of the species is dependent on the protection it receives. Without the additional protection, the species or habitat is likely to decline in the future. Localized populations that are vulnerable or in decline, or species or habitats that offer some special value may also be considered locally important. Fish and Wildlife Habitat Conservation Areas also include areas associated with state priority species, and areas critical for habitat connectivity. These wildlife habitats are classified and rated by a variety of internal (site specific) and external (contextual) habitat conditions.

King County Comprehensive Plan

The King County code protects critical areas as well as their buffers in order to protect the health and safety of the County’s residents and its environment. In October of 2006, King County adopted ordinances 15605-15607, amending the 2004 Updated Comprehensive Plan. Chapter 4 of the King County Comprehensive Plan establishes recommendations for protecting listed and locally important wildlife and their breeding habitats. Protection is given to species of local importance using regulations, incentive programs, land purchases, networking of wildlife corridors, and development clustering. Species considered to be locally important in King County are shown in Table 1. In addition, King County is required to protect designated wildlife corridors, riparian corridors, and the breeding sites of two species of raptors and herons. These four species and their breeding habitats are shown in Table 2.

TABLE 1
King County Designated Locally Important Species

Common Name	Scientific Name	Family	Expected Occurrence in Study Area		Preferred Habitat / Basis for Occurrence Determination
			Likely Present	**Possibly Present**	
Locally Important Species listed by King County (King County Comprehensive Code Chapter 4)					
Trumpeter Swan	*Cygnus buccinator*	Bird		Known in the study area	Rare visitor to Marymoor Park during the winter. Seen fewer then 10x at Marymoor Park. Trumpeter Swans spend the winter from November to April in the open fields and estuaries of Skagit and Whatcom Counties. Recently, their range has expanded to Grays Harbor and other areas of western Washington. There are currently no trumpeter swans breeding in Washington
Tundra Swan	*Cygnus columbianus*	Bird		Known in the study area	Rare visitor to Marymoor Park during the winter. Seen fewer then 10x at Marymoor Park. Tundra Swans are common in fresh- and saltwater habitats throughout the lowlands of northwestern Washington from November to April. Almost 2,000 winter in Skagit County.
Snow Goose	*Chen caerulescens*	Bird		Known in the study area	Rare visitor to Marymoor Park during the winter. Seen fewer then 10x at Marymoor Park. Typically observed in large flocks. Up to 55,000 winter in western Washington. Most gather in the Skagit River Delta from mid-October to early May.
Band-tailed Pigeon	*Patagioenas fasciata*	Bird	Known in the study area		Found in low- and mid-elevation conifer and mixed conifer/deciduous forests. Requires a component of mature conifers. Band-tailed Pigeons prefer forest edges, especially open sites bordered by tall conifers.
Harlequin Duck	*Histrionicus histrionicus*	Bird		May Occur	In western Washington, harlequins historically bred in the Olympic and Cascade mountains. Wintering areas include northern Puget Sound, northern Hood Canal, the Strait of Juan de Fuca, San Juan Islands, and the Pacific coast. In winter they are common in marine waters along rocky shorelines and jetties. They are more common in northern Puget Sound then in southern portions of the Sound.
Western Bluebird	*Sialia Mexicana*	Bird		Known in the study area	Rare visitor to Marymoor Park. Seen fewer then 10x at Marymoor Park. In western Washington, Mountain Bluebirds

TABLE 1
King County Designated Locally Important Species

Common Name	Scientific Name	Family	Expected Occurrence in Study Area		Preferred Habitat / Basis for Occurrence Determination
			Likely Present	**Possibly Present**	
					are uncommon in the Fort Lewis area, and rare in forest clearings in King, Pierce, Thurston, and Mason Counties.
Brant Goose	*Branta bernicla nigricans*	Bird	No	No	Found in estuaries, beaches, bays and spits where they feed and rest before their migration north to Arctic breeding grounds. Ninety-five percent of their diet is composed on eelgrass (*Zostera marina* and *Zostera japonica*) which grow on inter-tidal mudflats.
Black-crowned Night Heron	*Nycticorax nycticorax*	Bird	No	No	Black-crowned Night-herons have been known to breed in western Washington's eastern Puget Trough lowlands. Frequently nest on island and in large trees in small colonies. Usually found in fresh and saltwater wetlands. In spring and fall, they can be found in wetlands flanking large river basins.
Blue Grouse	*Dendragapus obscurus*	Bird	No	No	In Washington, blue grouse are found in three distinct areas east of the Cascades. Blue grouse are found in mountainous areas wherever open coniferous forests are present. They are closely associated with true fir (*Abies* spp.) and Douglas fir *(Pseudotsuga menziesii*) forests.
Mountain Quail	*Oreortyx pictus*	Bird	No	No	Found on mountain slopes and foothills, in areas with dense cover supporting scattered open areas. Often found in dense thickets created by fires or clear cuts.
Mountain Goat	*Oreamnos americanus*	Mammal	No	No	Found in the Cascade Mountain range.
Columbian Black-tailed Deer	*Odocoileus hemionus columbianus*	Mammal	None	Locally Important	Found along the Pacific Coast from Alaska to northern California.
Elk	*Cervus elaphus*	Mammal	No	No	Found in the mountain ranges and shrub lands of the Olympic and Cascade mountains.
Marten	*Martes americana*	Mammal	No	No	Strongly associated with mature conifer forests. Historically found throughout the mountains of Washington, Oregon and California.
Mink	*Mustela vison*	Mammal	Known in the study area		Rare visitor to Marymoor Park. Seen fewer then 10x at Marymoor Park.

In addition, King County wrote local guidelines for ten terrestrial species most often encountered during proposal reviews in the County (Table 3). Section 198 of the King County Comprehensive Plan requires the county to protect the active breeding sites of these species, as well as the immediate area surrounding each site to prevent any disturbance to breeding activities. All ten species are either listed by the State as an endangered, threatened, sensitive, candidate or monitor species, or are listed as a locally important species by King County. The species include the bald eagle (*Haliaeetus leucocephalus)*, great blue heron (*Ardea herodias*), osprey (*Pandion haliaetus)*, peregrine falcon (*Falco peregrinus*), northern spotted owl (*Strix occidentalis*), marbled murrelet (*Brachyramphus marmoratus*) , Townsend's big eared bat (*Corynorhinus townsendii)*, Vaux's swift (*Chaetura vauxi)*, red-tailed hawk (*Buteo jamaicensis)*, and goshawk (*Accipiter gentilis*).

For all other species included in the King County Comprehensive Plan, the County is required to establish protective standards if a breeding site is discovered during a project review. The protective standards are based on management guidelines and recommendations established by WDFW. Most of the species listed in the King County Comprehensive Plan do not occur in the East Link project area, as they are not found in urban or commercially developed areas. In some cases however, their breeding habitat is still protected, even though the species itself is not actively breeding or occurring at the location.

TABLE 2
Wildlife Breeding Habitats Designated as having Local Importance in King County

Common Name	**Scientific Name**	**Family**	**Expected Occurrence in Study Area**		**Preferred Habitat / Basis for Occurrence Determination**
			Likely Present	**Possibly Present**	
Species Whose Breeding Habitats are Included in King County's Fish and Wildlife Habitat Conservation Areas (King County Comprehensive Code Chapter 4)					
Great Blue Heron	*Ardea Herodias*	Bird	Known in the study area		Nests in small to medium sized colonies ranging from 3 to 30 nests. Colonies usually in secluded deciduous forests, but can adapt to some levels of disturbance gradually, over time. Will use conifer forests occasionally. Colonies often <1mile away from wetlands or large water bodies. Listed due to its sensitivity to disturbances and dependence on wetlands, wet meadows, and water bodies.
Black-crowned Night Heron	*Nycticorax nycticorax*	Bird	No	No	Black-crowned Night-herons have been known to breed in western Washington's eastern Puget Trough lowlands. Usually nest on island and in large trees in small colonies. Often found in fresh and saltwater wetlands. In spring and fall, they can be found in wetlands flanking large river basins.
Red-tailed Hawk	*Buteo jamaicensis*	Bird	Known in the study area		Found in areas with a mix of forests and open spaces, including agricultural land, grasslands, wetlands and meadows. Small mammals, especially rodents, are their

			Likely Present	**Possibly Present**	
					primary prey.
Osprey	*Pandion haliaetus*	Bird	Known in the study area		Nests in exposed trees or platforms that provide a clear, unobstructed view of surrounding area. Nests close to large bodies of water. Territorial. Several known active nests and territories in Segments B, C, and E.

TABLE 3
King County Designated Wildlife Habitat Conservation Area Breeding Areas

Common Name	**Scientific Name**	**Fish and Wildlife Habitat Conservation Area**	**Protective Nesting Habitat Recommendations when Active Nesting or Breeding is Determined for a Site:**
Bald Eagle	Haliaeetus leucocephalus	400-foot radius from active nest	• No alterations within 800 feet from March 15 through April 30 (incubation and first three weeks of brooding). • Maintain a 400 foot radius around nest trees. • Prohibit use of land-clearing machinery within 800 feet from January 1 through August 31.
Great Blue Heron	Ardea herodias	820-foot radius from the rookery. WDFW can increase radius up to an additional 164 feet if population of rookery is declining	• No clearing or grading disturbance from January 1 through July 31 within 924 feet around existing rookeries. • Maintain 820 foot radius around existing rookeries that are known to be stable; buffer may be increased by 164 feet if population of rookery is declining.
Marbeled Murrelet	Bracyrhampus marmuratus	One-half mile radius around an active nest	• Protect area within 0.5 mile of nest trees.
Northern Spotted Owl	Strix Occidentalis	3,700-foot radius from an active nest	• Protect 3,700 foot radius from nest tree.
Goshawk	Accipter gentilis	1,500-foot radius around an active nest located outside of the Urban Growth Area (UGA)	• Maintain 1,500 foot radius around active nest sites located outside the urban growth area.
Osprey	Pandion haliaetus	230-foot radius around an active nest	• No disturbance within 660 feet from April 1 through September 30. • Maintain 230 foot radius around active nest.

TABLE 3
King County Designated Wildlife Habitat Conservation Area Breeding Areas

Common Name	**Scientific Name**	**Fish and Wildlife Habitat Conservation Area**	**Protective Nesting Habitat Recommendations when Active Nesting or Breeding is Determined for a Site:**
Peregrine Falcon	Falco peregrinus	Extending 1,000 feet of an eyrie on a cliff face, the area immediately above the eyrie on the rim of the cliff, and the area immediately below the cliff	• No human activity along the nest cliff rim, immediately below nest cliffs, or on the cliff face within 1,000 feet at any time of year. • No surface-disturbing activities that would produce loud noises (e.g. blasting, operation of chainsaws and heavy machinery) from March 1 through June 30 within .5 miles of nest. • Route power lines 1,000 feet from eyries.
Red-tailed Hawk	Buteo jamaicensis	325-foot radius from an active nest located outside of the UGA	• Maintain an area with a radius of 325 feet from an active nest located outside the urban growth area. • Clearing and grading is not allowed within 660 feet of an active nest located outside of the urban growth area from March 1-July 31
Common Name	Scientific Name	Fish and Wildlife Habitat Conservation Area	Protective Nesting Habitat Recommendations when Active Nesting or Breeding is Determined for a Site:
Vaux's Swift	Chaetura vauxi	300-foot radius around an active nest located outside of the UGA	• Maintain a 300 foot radius around active nest sites outside the urban growth area. • No clearing or construction activities within 400 feet of active or potential nest trees from April 1 through October 31, unless potential nest tree is proved to contain no nests.
Townsend's Big-eared Bat	Corynorhinus townsendii	June 1-Oct 1 – 450-foot radius around from entrance to a cave or mine located outside of the UGA, within an active nursery colony Nov. 1-March 31 – 450-foot radius around the entrance to a cave or mine located outside the UGA serving as a winter hibernacula	• Maintain a minimum 450' radius in all directions from the entrance of a cave or mine of an active and alternate nursery sites located outside of the urban growth area from June 1-October 1 • Establish 450 foot radius around the entrance to the cave or mine serving as winter hibernacula November 1 - March 31 outside of the urban growth boundary • A building, bridge or tunnel, or other structure used solely for day or night roosting shall not be altered from March 1-November 30 • The entrance to a cave or mine that is

TABLE 3
King County Designated Wildlife Habitat Conservation Area Breeding Areas

Common Name	Scientific Name	Fish and Wildlife Habitat Conservation Area	Protective Nesting Habitat Recommendations when Active Nesting or Breeding is Determined for a Site:
			protected because of bat presence is protected from human entry May 1 – September 15 • Gate entrance to cave or mine that is protected because of bat presence must be designed to allow bats to enter and exit.

Specifically, King County is required to protect:

1. habitat for all federally and state listed endangered, threatened, and sensitive species, and state candidate species
2. habitat used by locally important species
3. designated WDFW wildlife corridors
4. riparian corridors
5. locally important salmonid habitats
6. commercial and recreational shellfish beds
7. kelp and eelgrass beds
8. herring, sand lance and smelt spawning areas
9. habitat used by nesting red-tailed hawks
10. habitat for raptors and herons of local importance: osprey, great blue heron and black-crowned heron, and
11. habitat used by locally important marine species: freshwater mussels, geoduck clam, Pacific oyster, Dungeness crab, Pandalid shrimp, red urchins, white sturgeon, Pacific herring, channel catfish, longfin smelt, surfsmelt, Pacific cod, Pacific whiting, black rockfish, copper rockfish, quillback rockfish, yelloweye rockfish, lingcod, Pacific sand lance, English sole and rock sole.

Bellevue Ordinance #5680

Bellevue updated its Land Use Code in 2001 to incorporate critical area regulations. Under LUC 20.25H.025, any habitat associated with a species of local importance is designated a critical area. Furthermore, if a habitat associated with a species of local importance is impacted by a proposed development, the proposal shall implement the WDFW wildlife management plan designed for that species. If the habitat does not include a critical area or critical area buffer, but is occupied by a locally important species, then only the guidelines in the wildlife management plan need to be followed. Updating the Land Use Code also led to the creation of a Critical Areas Overlay District. This district excludes downtown Bellevue, as it focuses on the recognition of natural, sensitive and hazard areas and imposes regulations on the use and development of these properties. Locally important species in Bellevue are show in Table 4.

TABLE 4
Designated Locally Important Wildlife in the City of Bellevue

Common Name	**Scientific Name**	**Animal Group**	**Expected Occurrence in Study Area**		**Preferred Habitat / Basis for Occurrence Determination**
			Likely Present	**Possibly Present**	
Locally Important Species listed by the City of Bellevue (LUC 20.25H.150)					
Bald Eagle	*Haliaeetus leucocephalus*	Bird	Known in the study area		Nests in wooded areas with larger trees within a half mile of large bodies of water. Highly territorial of nesting tree. May have more than one nest tree per territory, as well as roost and perch trees. Several known territories in Segments A, B, and E.
Peregrine Falcon	*Falco peregrinus*	Bird	Known in the study area		Two historical and recent eyries in Segment A. Nests in sheltered cliff areas naturally, has adapted to using bridges and buildings for nesting sites.
Common Loon	*Gavia immer*	Bird		Known in the study area	Population has declined due to acid rain, pollution, industrial contamination of water bodies and lead poisoning. Artificial floating nesting platforms have reduced the negative impact of fluctuating water levels from human activities to nests.
Pileated Woodpecker	*Dryocopus pileatus*	Bird	Known in the study area		Requires wooded forests with a component of dead and dying trees and snags for foraging and nesting. Prefers deciduous forests. Will occur in conifer forests with some deciduous tree component. Found at Marymoor Park. One bird observed in WR-5.
Vaux's Swift	*Chaetura vauxi*	Bird		Known in the study area	Nests and forages in groups with 30 or more birds. Nest is a cup shaped nest placed in a dark, confined cavity. Breeds in mountains and foothills, usually >700 meters in elevation. Forages over wooded areas and more open habitats, including towns.
Merlin	*Falco columbarius*	Bird	Known in the study area		Seen during the nesting season at Marymoor Park.
Purple Martin	*Progne subis*	Bird	Known in the study area		Nests in structures over water bodies, including natural cavities, pilings, and man-made housing structures. Forages over open water or wet areas for insects while in flight. Nesting

TABLE 4
Designated Locally Important Wildlife in the City of Bellevue

Common Name	**Scientific Name**	**Animal Group**	**Expected Occurrence in Study Area**		**Preferred Habitat / Basis for Occurrence Determination**
			Likely Present	**Possibly Present**	
					observed at Marymoor Park in 2003, but no activity since. Population believed to be in decline throughout its range.
Western Grebe	*Aechmophorus occidentalis*	Bird	Known in the study area		Nests in colonies numbering up to several hundred birds on large inland lakes or in coastal marshes of the western United States. Birds breeding in the northern extent of their range migrate to the western coastal ocean to spend the winter.
Great Blue Heron	*Ardea herodias*	Bird	Known in the study area		Nests in small to medium sized colonies ranging from 3 to 30 nests. Colonies usually in secluded deciduous forests, but can adapt to some levels of disturbance gradually, over time. Will use conifer forests occasionally. Colonies often <1mile away from wetland or large water bodies. Listed due to its sensitivity to disturbances and dependence on wetlands, wet meadows, and water bodies.
Osprey	*Pandion haliaetus*	Bird	Known in the study area		Nests in exposed trees or platforms that provide a clear, unobstructed view of surrounding area. Nests close to large bodies of water. Territorial. Several known active nests and territories in Segments B, C, and E.
Green Heron	*Butorides virescens*	Bird	Known in the study area		Breeds in small wetlands on a platform built nest that is either in a tree or shrub, close to the water. Feeds on small fish, insects, and amphibians. Nests at Marymoor Park.
Red-tailed Hawk	*Buteo jamaicensis*	Bird	Known in the study area		Found in areas with a mix of forests and open spaces, including agricultural land, grasslands, wetlands and meadows. Small mammals, especially rodents, are their primary prey.
Townsend's western Big-eared Bat	*Corynorhinus townsendii townsendii*	Bat		May Occur	Areas with a mosaic of woodland/grassland and/or shrub land, esp. coniferous mosaics. Found in Pierce County, Fort Lewis.

TABLE 4
Designated Locally Important Wildlife in the City of Bellevue

Common Name	Scientific Name	Animal Group	Expected Occurrence in Study Area		Preferred Habitat / Basis for Occurrence Determination
			Likely Present	**Possibly Present**	
Keen's myotis	(*Myotis keenii*	Bat		Unlikely to occur in the study area.	Keen's myotis has one of the most limited ranges of any bat species in North America**.** Habitat use is restricted to dense forests with old growth characteristics. Range is limited to the Olympia Peninsula and low elevation conifer forests in Puget Sound region.
Long-legged myotis	*Myotis volans*	Bat		May occur	Occurs in forested areas statewide. Prefers mountainous, coniferous forests. Often found along forest edges, can occur at high elevations in cool, wet forests.
Long-eared myotis	*Myotis evoti*	Bat		May occur	Found in wooded areas statewide; however, it is most common in eastern Washington lodgepole pine forests. Does occur in humid coastal forests with good ground cover. Will occur in any forested habitat except those with no ground cover or in mid-to-high density developments.
Oregon spotted frog	*Rana pretios*)	Amphibian		Unlikely to occur in the study area.	Highly aquatic amphibian, usually found in or near permanent bodies of still water 9 acres in size or more, including lakes, marshes, and wetlands, and vegetated, slow-flowing perennial streams. Population has experienced heavy declines in the last 20 years. In 1997, only three known populations remained in Washington.
Western Toad	*Bufo boreas*	Amphibian		May Occur	Found in a variety of habitats, including slow-moving rivers and streams, and near ponds and lakes. Large population declines in the Northwest. Listed as occurring in the Lake Washington Basin.
Western pond turtle	*Clemmys marmorata*	Amphibian		Unlikely to occur in the study area.	The western pond turtle is a highly aquatic turtle that has been extirpated from almost all of its Washington range. The Washington population consists of a few isolated and scattered populations. The range historically included streams, ponds, lakes, and permanent and ephemeral wetlands throughout the Puget Sound lowlands

TABLE 4
Designated Locally Important Wildlife in the City of Bellevue

Common Name	Scientific Name	Animal Group	Expected Occurrence in Study Area		Preferred Habitat / Basis for Occurrence Determination
			Likely Present	**Possibly Present**	
Chinook salmon	*Oncorhynchus tshawytscha*	Fish	Known in the study area		Found in Lake Washington, Sammamish River, and Bear Creek, Mercer Slough, Kelsey Creek, Sturtevant Creek, West Tributary to Kelsey Creek, Goff Creek, Valley Creek, and Sears Creek. Found in Segments A, B, D, and E.
bull trout	*Salvelinus confluentus*	Fish	Known in the study area		Found in Lake Washington, and possibly in Sammamish River and Bear Creek, but rare in all cases. Found in Segment A, and possibly in Segment E.
Coho salmon	*Oncorhynchus kisutch*	Fish	Known in the study area		Found in Lake Washington, Sammamish River, and Bear Creek, Mercer Slough, Kelsey Creek, West Tributary to Kelsey Creek, Goff Creek, Valley Creek, and Sears Creek. Found in Segments A, B, D, and E.
River lamprey	*Lampetra fluviatilis*	Fish	Known in the study area		Found in Mercer Slough, Kelsey Creek, Sammamish River, and Bear Creek. Found in Segments A, B, and E.

City of Mercer Island Locally Important Species

The City of Mercer Island Comprehensive Land Use Plan includes Ordinance No. 05C-12, which details their critical areas regulations. In order to streamline their critical areas regulations, the City of Mercer Island adopted WDFW's Priority Habitat and Species program in its entirety in 1998. The City of Mercer Island relies solely on the United State Fish and Wildlife Service (USFWS) and WDFW for species listings. WDFW management guidelines and recommendations for state listed species are followed. In addition, the City of Mercer Island's City Council has not designated any species as having local importance.

City of Redmond Locally Important Species

The City of Redmond's Critical Areas Ordinance (Ordinance #2259) applies species protection to State Species of Concern, Priority Species designated by WDFW, and locally important species. Only one species, the great blue heron, is currently listed as a locally important species in Redmond. The red-tailed hawk was listed as a locally important species until 2004.

Redmond's critical areas ordinance established a set of recommendations for development within the urban growth boundaries of the city. These recommendations focus on using incentive programs, density transfers and existing state regulations to minimize impacts to natural areas. This is accomplished by clustering developments and, when possible, avoiding development in critical areas or their buffers. The primary framework of habitat management in the City of Redmond is the creation of habitat reserves and linking these reserves together using wildlife corridors. Following guidelines established in NE-79 and NE-90, the City of Redmond recommends using reserves and corridors to reduce the effects of habitat fragmentation. Section NE-84 also calls for protecting habitats having a primary association with state and federally listed species and candidate species, and species of local importance.

Conclusion

Locally important wildlife species do occur in the East Link project area. WDFW has been contacted in regards to any mitigation or conservation measures they may require for the East Link project. Any conservation measures will follow the management guidelines established by WDFW for those specific species. These guidelines and recommendations may be enforceable if they fall under the guidance of state regulations such as SEPA. In addition, WDFW or King County may also require management guidelines to lessen the impact to locally important species as detailed in their critical areas ordinances.

Interstate 90/Homer Hadley Bridge, Light Rail Transit Stray Current—Assessment of Potential Effects on Fish Memorandum

Herrera Environmental Consultants, Inc.

Memorandum

To Marti Louther, James Irish, Sue Comis – Sound Transit
cc Ed Wetzel - Universal Technical Resource Services, Inc
From José Carrasquero, Eric Doyle - Herrera Environmental Consultants
Date June 13, 2008
Subject Interstate 90/Homer Hadley Bridge, light rail transit (LRT) stray current - Assessment of potential effects on fish

Sound Transit retained Herrera Environmental Consultants (Herrera) to conduct a preliminary investigation into the potential effects of changes in the stray electrical current field associated with the Interstate 90 Homer Hadley Bridge over Lake Washington (referred to hereafter as the I-90 bridge). Specifically, Sound Transit is proposing to build the East Link light rail transit (LRT) line on the I-90 bridge. Operation of the LRT system could discharge stray electrical current into Lake Washington. This weak direct (DC) current would leak into the environment through various conductive pathways along the bridge alignment, creating one or more small electrical current fields around the span. Possible current leakage pathways include the bridge's existing cathodic corrosion protection system, and the stray current mitigation system planned as part of LRT expansion. The intent of this assessment is to investigate if the change in stray electrical current conditions is of sufficient magnitude to pose potential adverse effects on aquatic species.

The findings of this assessment are summarized as follows:

1. The proposed LRT system will produce stray electrical current fields that are essentially negligible relative to existing conditions.

2. Expected field intensity produced by leakage from the LRT is difficult to calculate with precision, but will be very low in intensity, ranging from tenths to hundredths of a microvolt per centimeter direct current (µV/cm DC) (Wetzel 2008).

3. These values are one to two orders of magnitude below established physiological detection and behavioral response thresholds for even the most sensitive species of potential concern.

On this basis, it appears reasonable to conclude that any change in stray DC electrical current emissions resulting from LRT operation would be unlikely to result in adverse effects on fish species of potential concern in the Lake Washington system.

The assessment approach and the findings are described in the following sections.

Assessment Approach

The screening level assessment of potential stray current effects consisted of the following steps:

1. Confirm that fish species of potential concern may be present in the study area. (These include but are not limited to species listed under the Endangered Species Act [ESA]; species listed at the state level as species of concern; and game fish.)

2. Identify known biological response thresholds for these or sufficiently similar species in the available scientific literature.

3. Identify the strength, dimension, and configuration of the stray current field under existing and proposed conditions.

4. Compare the existing and proposed electrical field conditions to these known response thresholds and determine the likelihood of potential effects.

Fish Presence in the I-90 Bridge Vicinity

For the purpose of this assessment, fish species of potential concern include the following: resident and anadromous salmonids native to the Lake Washington basin (including ESA listed species); Pacific and river lamprey; longfin smelt; forage fish species; and other native and introduced game fish species. These species are referred to hereafter as Lake Washington species.

The potential presence of these species in the general vicinity was determined by consulting with two experts on Lake Washington fisheries investigations: Kurt Fresh, a research scientist with the NOAA Fisheries Northwest Fisheries Science Center; and Roger Tabor, a research scientist with the U.S. Fish and Wildlife Service. While both agreed that specific studies of fish habitat utilization in the immediate vicinity of the I-90 bridge are lacking, they confirmed that several Lake Washington species either utilize habitats in the vicinity of the bridge, or must pass under the structure when migrating between spawning and rearing habitats. As such, it is apparent that a number of Lake Washington species could occur within the area of potential effects.

Fish Response to Electrical Field Exposure: A General Review

To aid in interpreting the findings of this assessment, it is desirable to provide a general review how fish interact with and respond to electrical fields. Weak electrical fields are common in nature, and many organisms have evolved specialized means of detecting and orienting to these fields. Organisms with this specialized capability are referred to as electroreceptive, meaning they have the ability to detect, orient to, or even produce and navigate by an electrical field. Not all fish species are electroreceptive, and for most species that are this ability is limited to short-range sensory awareness used to locate prey species or detect objects at close range. However, certain fish species, including the sharks, lampreys, and other specialized higher fish, have specialized electroreceptive organ systems that greatly increase sensitivity to weak electrical fields (Hopkins 1983, New 1999, Smith 1991, Gibbs 2004, Von Der Emde 2007, Alves-Gomes 2001).

Electroreceptivity confers a number of useful abilities. For example, electroreceptive predators like sharks and rays are able to detect the weak electrical signals produced by muscle activity in their prey (Kalmjin 1982). Some fish species, such as eels, are able to detect and orient to the weak electrical fields generated by ocean currents, using these fields as a means of navigation (McCleave and Power 1978). Certain fish species that live in highly turbid water environments where eyesight is useless have evolved the ability to produce weak electrical fields that are used like sonar systems to communicate, navigate, and detect predators and prey (Knudsen 1974). Species like lamprey have evolved specialized electroreceptive organ systems to detect prey organisms (Bodznick and Preston 1983). Because of their specialized ability to detect weak electrical fields, electroreceptive fish species are by nature more susceptible to weak electrical fields, like those produced by stray current from LRT systems. Weak fields can stimulate or confuse their sensory systems, potentially altering behavior and physiology in ways that are difficult to observe and detect.

Most of the fish species common to Lake Washington, such as the trout, salmon, perch, and bass, lack specialized electroreceptive organ systems. As such they are unable to detect very weak electrical fields and are thereby relatively insensitive to weak field exposure.

Electroreceptivity should not be confused with behavioral and physiological responses that all fish exhibit in the presence of strong electrical fields. All organisms are susceptible to the effects of electrical shocks, which essentially "short-circuit" physiological systems. Responses to strong electrical field exposure can range from attraction or avoidance, to altered feeding behavior, or even unconsciousness. A sufficiently large electrical exposure can cause seizure, injury, and even direct mortality. Responses to strong electrical field exposure can vary widely, based on the species and size of the fish exposed, site specific conditions, and the nature of the electrical field (Snyder 2003).

For example, the orientation of a fish's body relative to an electrical field is a determining factor in amount of voltage exposure a fish will receive. A fish swimming parallel to an electrical field (i.e., directly towards or away from the source) will experience a larger exposure than one swimming perpendicular to the field. This is because the longest body axis is oriented to the increasing field strength, creating the greatest electrical gradient from end to end and thereby a large voltage potential. The fish oriented perpendicular to field strength presents a minimal aspect to the field, creating much smaller electrical potential from one side of the body to the other, minimal voltage exposure, and little or no effect. Larger fish are inherently more sensitive to strong electrical fields because a bigger body has inherently greater potential voltage gradient.

Literature Review Methods

Available information on the relevant biological response thresholds of Lake Washington fish species or similar organisms was derived from available scientific literature. Literature sources were identified using the Google Scholar online search engine. The studies relied upon in this assessment express electrical field strength in units of Volts per meter (V/M), volts per centimeter (V/cm), or microvolts per centimeter (µV/cm). These metrics are commonly used to characterize the response of biological organisms to electrical field exposure.

The types of threshold responses reported in this assessment range from physiological detection of the electrical field (e.g., measured changes in cardiac response), to behavioral detection (e.g., attraction, avoidance, twitching), to marked physiological responses including paralysis and injury. When considering this information, it is important to note that electrical fields capable of causing paralysis or injury are many orders of magnitude stronger than what is expected from the I-90 stray current field. The intent of providing this information is to present a basis of comparison to the expected strength of the I-90 stray current field.

Physiological and Behavioral Response Thresholds for Electrical Field Exposure

The literature review identified several exposure response thresholds that are relevant to Lake Washington species. This information is summarized in Table 1. The range of response thresholds shown varies from the smallest observed physiological and behavioral detection limits, to electrical field strength sufficient to cause injury and incapacitation. The intent of providing this broad range of threshold values is to provide a broader context for interpreting the potential effects of the I-90 stray current field.

Stray Current Field Strength and Dimensions Under Existing and Proposed Conditions

The strength and dimensions of the stray current field under existing and proposed conditions was characterized for Sound Transit by Mr. Ed Wetzel of Universal Technical Resource Services, Inc (UTRS) (Wetzel 2008). Per request from Herrera staff, these values were provided in the same units commonly used to characterize biological effects (µV/cm). The maximum strength of the I-90 stray current field under existing and potential future conditions is shown in Table 2. These estimates represent the worst-case stray electrical current field strength and size expected to occur under each condition.

While the LRT system will produce a stray current field, the proposed system design and additional shielding mechanisms will limit the intensity of this field to very low levels. The cathodic protection system is expected to be the dominant source of electrical current emanating from the I-90 bridge. The positioning and orientation of the cathodic protection system and the intensity of the field it produces are not expected to vary measurably under proposed conditions with LRT operation.

Table 1. Electrical field strength associated with observed responses in various fish species.

Response Type	Species Type	Environment Type Where the Response was Observed	Electrical Field or Source Strength Associated with Observed Response	Source
Attraction/avoidance (attraction to the anode, avoidance or repulsion from the cathode)	Lamprey	Marine	1–10 µV/cm	Bodznick and Preston 1983
Twitch response to field exposure	Lamprey	Marine	10-60 µV/cm @ 0.05-0.5 Hz	Muraveiko 1984
Observed physiological detection limit (measurable change in heart rate or the electrical pattern of the heartbeat)	Atlantic salmon, American eel	Freshwater	7-70 µV/cm @ 60-75 Hz	McCleave et al. 1974
Theoretical limit above which chronic electrical field exposure could alter cellular biochemical systems.	n/a	General	90 µV/cm	Weaver et al. 1998
Attraction (anodic taxis)	Rainbow trout (21 to 50 cm fork length)	Freshwater (conductivity 530 µS/cm @ 18ºC)	0.13-0.19 V/cm pulsed DC @ 15 Hz 0.05-0.09 V/cm pulsed DC @ 60 Hz	Meismer 1999 (as cited in Snyder 2003)
	Colorado pike minnow (30 to 39 cm fork length)	Freshwater (conductivity 530 µS/cm @ 18ºC)	0.16-0.21 V/cm pulsed DC @ 15 Hz 0.09-0.20 V/cm pulsed DC @ 60 Hz	Meismer 1999 (as cited in Snyder 2003)
Twitch response to field exposure	Rainbow trout (31 to 48 cm fork length)	Freshwater (conductivity 103 µS/cm @ 11ºC)	0.19-0.43 V/cm pulsed DC @ 20 Hz 0.15-0.71 V/cm pulsed DC @ 30 Hz 0.11-0.97 V/cm pulsed DC @ 60 Hz	Taube 1992 (as cited in Snyder 2003)

Altered migratory behavior (changed orientation relative to electrical field)	American eel elvers (juveniles)	Marine	1 µA/cm^2 to 100 µA/cm^2	McCleave and Power 1978
Observed avoidance responses (electrofishing voltage used to direct fish out of an in-water work area)	Salmonids (adult and juvenile), other resident fish species	Freshwater (riverine ~1-6 ft. depth)	500 to 1,000 V pulsed DC @ 7.5 Hz	Johnson and Hoffman 2000
Observed avoidance responses (electrical fish barrier used to prevent access to an in-water work area)	Salmonids (adult and juvenile)	Freshwater (riverine ~1-6 ft. depth)	~0.5 to 100 V/M pulsed DC @ 2 Hz	Johnson and Hoffman 2000

Table 1 (continued). Electrical field strength associated with observed responses in various fish species.

Response Type	Species Type	Environment Type Where the Response was Observed	Electrical Field or Source Strength Associated with Observed Response	Source
Recommended voltage settings for electrofishing equipment to avoid fish injury (voltage requirements dependent on conductivity)	Salmonids (juvenile)	Freshwater	100 to 800 V pulsed DC @ ≤30Hz	WSDOT 2006
Electrofishing injury (electrofishing voltage settings associated with spinal and tissue injury)	Rainbow trout (juvenile)	Freshwater	300 V pulsed DC @ 30 Hz	McMichael et al. 1998
			1-9 V/cm within 100 cm of anode (produced by electrofishing at a setting of 350-400 V @ 60 Hz)	Dalbey et al. 1996
Stunning or unconsciousness	Rainbow trout (31 to 48 cm fork length)	Freshwater (conductivity 103 µS/cm @ 11ºC)	0.53-10.4 V/cm pulsed DC @ 20 Hz 0.92-6.5 V/cm pulsed DC @ 30 Hz 0.61-6.4 V/cm pulsed DC @ 60 Hz	Taube 1992 (as cited in Snyder 2003)
	Rainbow trout (21 to 50 cm fork length)	Freshwater (conductivity 530 µS/cm @ 18ºC)	0.54-0.70 V/cm pulsed DC @ 15 Hz 0.14-0.20 V/cm pulsed DC @ 60 Hz	Meismer 1999 (as cited in Snyder 2003)
Stunning or unconsciousness (continued)	Colorado pike minnow (30 to 39 cm fork length)	Freshwater (conductivity 530 µS/cm @ 18ºC)	0.25-0.36 V/cm pulsed DC @ 15 Hz 0.18-0.27 V/cm pulsed DC @ 60 Hz	Meismer 1999 (as cited in Snyder 2003)
	Atlantic salmon (adult)	Marine	15-250 V/M @ 50 Hz AC (depending on duration of exposure)	Roth et al. 2003

µV/cm = microvolts per centimeter
V/cm = volts per centimeter
V/M = volts per meter
µS/cm = microsiemens per centimeter (measure of electrical conductivity)
DC = direct current
Hz = Hertz
V = volts
ºC = degrees Celcius
Fork length = the length of a fish from the tip of the nose to the indent, or fork, in the middle of the tail fin

Table 2. Stray electrical current field strength under the I-90 bridge, under existing and proposed conditions

Source	Parameter	Existing Conditions	Proposed LRT Conditions	Notes
Existing cathodic corrosion protection system	Electrical field intensity	Maximum: 26.2 µV/cm DC Typical: 13.1 µV/cm DC	Similar to existing conditions.	LRT operation will have little impact on the potential strength of the stray current field. Maximum rectifier output is the limit of the rectifier specifications. Most units are operating about half the rated output. Planned upgrades in rectifier and anode design will maintain current conditions, or possibly reduce field intensity.
	Maximum electrical field size around each cathode/anode	30 meters (horizontal) 21 meters (vertical)	30 meters (horizontal) 21 meters (vertical)	The electric field will be concentrated between the cathode (anchor cable) and the anode, which are spaced approximately 30 meters apart. Each anode is suspended 10 to 11 meters below the surface and is between 10 to 21 meters in length.
	Minimum horizontal distance between each field	10 meters (horizontal) Pontoons A & R; 5 meters pontoon J; 100 meters remaining pontoons.	10 meters (horizontal) Pontoons A & R; 5 meters pontoon J; 100 meters remaining pontoons.	
Stray electrical current from LRT system	Maximum electrical field intensity	n/a	Uncertain but will most likely range from 10^{-1} to 10^{-2} µV/cm DC	The proposed LRT system will produce a stray DC current field, but the design and additional shielding mechanisms will limit the intensity of this field to very low levels (essentially negligible in comparison to the existing cathodic corrosion protection system). The size and orientation of the potential stray DC current field is difficult to determine. Stray current could leak to the aquatic system through a number of pathways on the structure, including drainpipes, power lines, the cathodic protection system, and even the concrete structure itself when wet with rain. It is not practical to analyze each of these potential pathways for the purpose of this analysis. Given the limited intensity of the field however, its size and orientation would appear to be irrelevant with regards to potential effects.
	Field size and orientation	n/a	Unknown	

Source: Wetzel 2008.
AC = alternating current
DC = direct current
LRT = light rail transit

As shown in Table 2, operation of the LRT system on the I-90 bridge will not change the output of the cathodic corrosion protection system in any significant way, meaning that the existing electrical field intensity and orientation associated with this feature will remain unchanged under proposed conditions (Wetzel 2008).

The LRT system is expected to produce a stray electrical current field in and around the I-90 bridge. Because this current can discharge along any conduction pathway, the location and extent of this field is difficult to predict. However, much of the discharge is likely to occur from the stray current mitigation system. The intensity of this stray current field is expected to be on the order of 10^{-1} to 10^{-2} μV/cm DC (Wetzel 2008).

Comparison of Stray Current Field Intensity to Established Response Thresholds

Retrofitting of the I-90 bridge to support the LRT system could conceivably alter the electrical field associated with the structure through two pathways: 1) modification of the cathodic corrosion protection system; and 2) creation of a stray electrical current field leaking from the DC electrical system used to power the trains. As shown in Table 2, the size and intensity of the electrical field produced by the existing cathodic protection system is not expected to change under the proposed conditions. As there is no related change in stressor exposure for fish Lake Washington species, there is no further need to consider this particular issue.

The stray current field produced by the LRT system will result in a change in potential electrical exposure from the existing conditions. However, the range of electrical field intensity likely to occur from stray current leakage appears to be lower than levels necessary for sensory detection or physiological effects in Lake Washington species. The intensity of the stray current field will range between 10^{-1} to 10^{-2} μV/cm DC. These levels are one to three orders of magnitude lower than observed physiological response limits in Atlantic salmon and American eel (7-70 μV/cm DC) (McCleave et al. 1974). These species are representative of the likely sensitivity of the majority of Lake Washington species exposed to stray electrical current.

Lamprey are the most electroreceptive, and thereby the most potentially sensitive of the Lake Washington fish species to stray current field exposure. At least one and possibly two species of lamprey (Pacific and river lamprey) are known to occur in the Lake Washington basin (a third species, western brook lamprey, may also be present). Even in the case of lamprey however, the anticipated stray current field appears to be at least one to as much as two orders of magnitude below known physiological and behavioral response thresholds (Bodznick and Preston 1983; Muraveiko 1984).

In recent years, concerns have emerged regarding the potential health effects of long-term exposure to low intensity electro-magnetic fields. Theoretically, long-term exposure even at levels below behavioral response thresholds could lead to adverse effects that would otherwise go undetected. Considerable research effort has been devoted to this concern. For example, Weaver et al. (1998) examined the biochemical response profile of various cellular systems to electromagnetic field exposure in order to evaluate the potential for human health effects. They developed a model to estimate the minimum threshold limits at which an electromagnetic field could potentially cause harmful changes in cellular level physiological systems. They determined that 90 µV/cm was the minimum field intensity necessary to alter physiological systems at the cellular level in species lacking specialized electroreceptive organ systems. Like the physiological and behavioral response thresholds discussed previously, the anticipated I-90 stray DC current field is well below this threshold.

Conclusions

The East Link project proposal to locate LRT on the I-90 bridge is likely to create a low intensity stray current field around the bridge structure. The size and intensity of this field cannot practically be determined with accuracy. However the best possible estimate indicates that stray current intensity will be one to three orders of magnitude below physiological or behavioral response thresholds for even the most sensitive Lake Washington fish species. Given these findings, the conclusion of this screening level assessment is that stray current from LRT operation is unlikely to lead to adverse effects on aquatic life, and there is no need to investigate the issue further.

Chapter 1

Introduction

An ecosystem is the interaction between plants, animals, microorganisms, and the physical environment in which they live. Ecosystems are made up of living organisms, including humans, and the environment they inhabit. Understanding this relationship is basic to the environmental review process and the assessment of impacts on ecosystems. This technical report addresses the ecosystem components—aquatic resources, vegetation and wildlife, and wetlands—in the vicinity of the East Link Project alternatives. The report describes the affected environment as well as the expected temporary construction impacts and permanent operational impacts on these ecosystem resources for each of the project alternatives. It also discusses measures intended to avoid and minimize impacts and compensatory mitigation for unavoidable impacts. This report is organized into five main parts, beginning with a summary of data-gathering activities, identification of related laws and regulations, definition of the study area, and assumptions (Section 1.0); followed by Section 2.0, Study Objectives and Methods; Section 3.0, Affected Environment; Section 4.0, Environmental Consequences; and Section 5.0, Potential Mitigation Measures. Section 6.0 provides reference information.

1.1 Data Gathered

Sound Transit conducted a literature and data review to identify and characterize potentially affected resources in and near the project vicinity. Existing documentation and information was compiled and reviewed first so that the field reconnaissance effort could focus on filling information gaps. Existing natural resource information was gathered from many local, state, and federal agencies. This information included published and unpublished reports, maps, websites, aerial photographs, and interviews with agency staff familiar with resources within the project vicinity. The data sources are listed in the following subsections.

1.1.1 Agency and Public Contacts

Sound Transit contacted the following local jurisdictions, agencies, organizations, and individuals for up-to-date information on ecosystems resources:

- City of Bellevue Development Services, Transportation, Utilities, and Parks departments
- City of Redmond Planning and Community Development and Public Works departments
- East Lake Washington Chapter of the Audubon Society
- Friends of Marymoor Park
- Friends of Mercer Slough
- King County Department of Natural Resources, Parks Department, and Water Resource Inventory Area (WRIA) planning group
- Muckleshoot Indian Tribe
- Snoqualmie Tribe
- Suquamish Tribe
- Tulalip Tribe
- Yakama Tribe
- Duwamish Tribe
- National Marine Fisheries Service (NMFS)
- U.S. Army Corps of Engineers (USACE)

- U.S. Fish and Wildlife Service (USFWS)
- Washington Department of Fish and Wildlife (WDFW)
- Washington Department of Natural Resources (DNR) Natural Heritage Program
- Washington State Department of Ecology (Ecology)

1.1.2 Maps and Existing Documentation

Maps and other existing reports were an important resource used to identify ecosystem features within the project vicinity. The following map resources were used:

- Aerial photography of the project corridor
- Bear Creek Basin Plan (King County, 1992)
- Bear Creek Parkway Extension Final Supplemental Environmental Impact Statement (EIS) (City of Redmond, 2004)
- Bel-Red Corridor Project Draft EIS (City of Bellevue, 2007b)
- Bel-Red Corridor Project Final EIS (City of Bellevue, 2007)
- Best Available Science Review for King County, City of Redmond, and City of Bellevue
- Catalog of Washington Streams and Salmon Utilization maps
- Cities of Bellevue, Mercer Island, and Redmond for sensitive and protected species and habitat information
- Comprehensive plans for the Cities of Bellevue, Mercer Island, Redmond, and Seattle (2007)
- Draft Puget Sound Salmon Recovery Plan (Shared Strategy Development Committee, 2005)
- Hydric Soils of King County (Natural Resources Conservation Service [NRCS])
- I-405 Corridor Program: NEPA/SEPA Draft EIS and Draft Preliminary Section 4(f) Evaluation (June 2002)
- I-405 Bellevue Nickel Improvement Project: Wetlands Discipline Report (WSDOT, 2006)
- I-90 Two-Way Transit and HOV Operations EIS (Sound Transit and WSDOT, 2004)
- Information from reports, maps, and personal communications from local WDFW habitat biologists
- King County Conservation District (KCD) Soil Descriptions and Soil Report (KCD, 2000)
- King County sensitive areas map folio and wetland inventory (King County, 1990)
- Mapping information from sources such as wetland delineation reports and stream studies by other consulting firms, as available
- Publications of the Washington Natural Heritage Program (WNHP), available at http://www.dnr.wa.gov/nhp/refdesk/pubs/index.html
- Reports, maps, and personal communications from City of Bellevue and WRIA sources
- Salmon and Steelhead Habitat Limiting Factors Report for the Lake Washington Watershed (WRIA 8) (Kerwin, 2001)
- Sammamish River Corridor Conditions and Enhancement Opportunities Report (King County, 1993)
- Sound Transit Central Link Light Rail EIS (Sound Transit, 1999)
- Sound Transit Technical Back-up on Ecosystems: Central Link Light Rail Final EIS (Sound Transit, 1999)
- Stream inventory maps for the City of Bellevue
- U.S. Geological Survey (USGS) topographic maps (1:24,000)

- U.S. Soil Conservation Service (SCS) soil survey maps of King County (U.S. Department of Agriculture [USDA] SCS, 2008)
- USFWS National Wetlands Inventory (NWI) maps (1:24,000)
- WDFW fish distribution database (http://wdfw.wa.gov/fish-sh.htm)
- WDFW Priority Habitats and Species (PHS) maps (1:24,000)
- Wetland and stream inventory maps for the Cities of Bellevue, Mercer Island, Redmond, and Seattle, as available
- Shoreline Inventory Report – Technical Appendix Volume I, Wetlands (City of Bellevue, 2008)
- Shoreline Inventory Report – Technical Appendix Volume II, Habitat (City of Bellevue, 2008)
- Wildlife Habitat Profile (King County, 1987)
- Kelsey Creek and Tributaries 2006 Salmon Spawner Surveys (City of Bellevue, 2007a)
- Kelsey Creek and Tributaries 2008 Salmon Spawner Surveys (City of Bellevue, 2009)

1.2 Related Laws and Regulations

The following federal, state, and local laws, regulations, and agency jurisdiction and management guidance describe the applicable requirements for wetlands; threatened and endangered species, wildlife, and aquatic species and habitat for these species; and high-value habitats and species:

- Critical Area Ordinances (CAOs) for the Cities of Bellevue, Mercer Island, Redmond, and Seattle and King County
- Endangered Species Act (ESA)
- Executive Orders 89-10, 90-40, and 11990
- Growth Management Act (GMA) (Revised Code of Washington [RCW] 36.70A)
- Migratory Bird Treaty Act (MBTA)
- Bald and Golden Eagle Protection Act
- Local agency Shoreline Master Programs (SMPs)
- Magnuson-Stevens Fishery Conservation and Management Act (MSA)
- National Environmental Policy Act (NEPA)
- Sections 404, 402, and 401 of the Clean Water Act (CWA)
- Washington State Water Pollution Control Act
- Shoreline Management Act (SMA)
- State Environmental Policy Act (SEPA)
- Washington State Hydraulic code (Washington Administrative Code [WAC] Chapter 222-110)
- WDFW PHS Management Recommendations

1.3 Study Areas

Each resource required a specific study area, described below.

1.3.1 Aquatic Resources

Aquatic habitats include ponds, lakes, rivers, and streams. The study area for aquatic resources is defined as 100 feet upstream and 300 feet downstream from where project limits cross a stream and the entire stretch of any stream, then runs parallel to a project alternative within 200 feet of the edge of the alternative. The 300-foot downstream limit is based on WAC 73-201A-400 and reflects the length of mixing zones in streams and rivers as agreed to by NMFS and USWFS for ESA consultation.

1.3.2 Vegetation and Wildlife Resources

Sound Transit has established distinct study areas for vegetation and wildlife resources.

For vegetation, the study area is within 100 feet of either side of the project alternatives and the area within the vicinity of stations, maintenance facilities, park-and-ride lots, traction power substations, and roadway widening, including any trees of significance (as defined by the applicable jurisdiction) within these areas.

For wildlife, the study area was determined by the types of species known to exist near the project.

1.3.3 Wetland Resources

Wetlands are defined by soil characteristics, presence or absence of hydrology, and dominance of vegetation adapted to wet environments. Many wetlands in the study area are considered jurisdictional waters of the United States by the USACE and are protected by federal regulations and local CAOs. The wetland study area is defined as wetlands and wetland buffers within 200 feet of either side of the project alternatives and the area within the project limits, including the trackway, stations, maintenance facilities, park-and-ride lots, traction power substations, and roadway widening. Wetland buffers, which are necessary to evaluate project impacts, may extend beyond the wetland study area.

1.4 Assumptions

1.4.1 Impact Assessment

The process of analyzing and estimating project impacts requires a series of assumptions regarding the physical extent of impacts, the duration of impacts, site restoration following construction, and measures that would be implemented to avoid or minimize potential impacts. This includes temporary construction impacts (between the permanent project right-of-way and the construction limits), and permanent operational impacts within the project right-of-way. The following subsections identify these assumptions.

1.4.1.1 Temporary Construction Impacts

Sedimentation Risk on Aquatic Resources

The spatial extent of water bodies and aquatic resources that may be adversely affected by construction activities varies depending on the type and magnitude of impact. The primary temporary construction impacts would be from sediment-related inputs to streams. Minor inputs would likely affect relatively short sections of stream before sediment settles out of suspension. Major inputs of sediment may be carried for longer distances. A short distance might be approximately 100 feet, while a major sedimentation event might affect a stream for 1,000 feet or more. Impacts from temporary turbidity are generally less than for sediment deposition. However, the distance the impact might cover is greater. The lighter the suspended particulates are, the longer it stays in suspension. Clay particulates settle out the slowest.

In this context, risk is the inherent potential for sediment–related impacts on aquatic resources, such as sedimentation or turbidity, and is site specific (hereafter referred to as sedimentation risk). Table 1-1 describes several example situations for assessing sedimentation risk. The greatest sedimentation risk would be where earthwork is conducted close to a stream or river, or on steep slopes with unstable soils, while the lowest risk would be from earthwork conducted at a greater distance from a stream on flat ground.

Erosion is caused when water from rain or snowmelt flows over ground surfaces that have bare or erodible soil that is not bound by plant roots. The more highly vegetated a surface is, the less likely that erosion will occur. The looser or inherently unstable a soil is, the more likely that erosion will occur for any given precipitation rate. The steeper the slope is, the more likely that erosion or even landslides might occur. The closer that erosion occurs to streams or other water bodies, the more likely that erosion-transported sediment will reach those water bodies.

TABLE 1-1
Example Situations for Assessing Sedimentation Risk to Aquatic Resources within the Study Area

High Sedimentation Risk	Moderate Sedimentation Risk	Low Sedimentation Risk
Earthwork that is done: • Within OHWM • Very close to water body • On steep slopes next to water body • On bare or erodible soil types on moderate to steep slopes • During wet season	Earthwork that is done: • Moderately close to water body • On level ground next to water body • On bare or erodible soil types on shallow slopes	Earthwork that is done: • Distant from water body • Separated from water body by vegetated buffer • Adjacent to piped water body • With minimal earthwork or soil disturbance

OHWM – ordinary high water mark

Measures to minimize sedimentation risk at a given site would be commensurate with risk, such as protecting exposed soils, constructing during the dry season, and implementing erosion controls. This may require multiple best management practices (BMPs) in some situations. Ultimately, BMP performance would determine the degree of impacts, if any.

Limits of Construction and Right-of-Way

For wetlands, and vegetation and wildlife, the construction limit is the area that would be disturbed during construction. This area is typically the 35-foot-wide strip on each side of the 30-foot-wide permanent right-of-way, which totals 100 feet wide. However, for many areas, the project engineers defined the specific construction footprint, which varies from the 100-foot (typically more narrow). In these areas, the engineers provided the construction limits. For analysis purposes, Sound Transit assumed that all lands within the construction limit would be disturbed during construction and that all vegetation would be removed.

Definition of Temporary Impacts

The duration of temporary construction impacts on wetlands would vary depending on the vegetation type and associated habitat functions that would be affected. As defined by Ecology et al. (2006a), temporary impacts are defined as follows:

- Short-term temporary impacts last for a limited time, and functions return to pre-impact performance fairly soon (about one year or within one growing season of the impact). For example, clearing emergent vegetation (e.g., cattails, rushes, sedges, or grasses) for temporary construction impacts associated with a road (for example, for a short-term staging area) changes how the wetland functions for a short time. Emergent vegetation might return within one growing season if the disturbance is not severe. Compensatory mitigation is often not required for short-term temporary impacts.

- Long-term temporary impacts affect wetland functions in such a way that they can be restored, or will eventually be restored over time, but not within a year or so. Long-term temporary impacts or alterations carry a risk of permanent loss, such as when soil is compacted by equipment, deep excavation is required, or pipeline trenches alter the water regime. Clearing a forested wetland for a temporary access road changes the plant community and degrades functions, such as songbird habitat provided by the tree canopy. It may take many years to grow back and re-establish the previous level of function. Long-term temporary impacts normally require compensatory mitigation but at a lower ratio than permanent impacts.

Wetland Impacts under Elevated Guideway

Since the Draft EIS was released in 2008, impacts on wetlands have been updated to reflect additional design input and updated information on construction techniques based on experience from the Sound Transit Central Link project. Additionally, the Draft EIS conservatively assumed that the area under the elevated guideway would be a permanent operational impact on wetlands because of possible shading from the structure. However, as learned from the Sound Transit Central Link project, in most cases, the shading impacts on wetlands are minimal (and at times beneficial) because the guideway structure would be relatively narrow (30 feet wide) and high enough above the ground surface (generally 15 feet or greater) to allow wetland herbaceous plants and shrubs to grow underneath. Height estimates of the elevated guideway refer to the distance from the existing ground surface to the bottom of the guideway structure. Beneficial impacts sometimes occur in the first summer following planting and perhaps for some time afterwards, from shading preventing the young, shallow-rooted plantings from drying out and dying.

The construction limits for all alternatives was limited to a total width of 100 feet, which includes the 30-foot-wide permanent right-of-way and a 35-foot-wide construction impact on each side of the right-of-way.

Wetland Buffer Impacts

Impacts on wetland buffers within the 35-foot-wide construction corridors and staging areas would be temporary. These buffers would be restored and replanted with native vegetation, which may often be an improvement over existing non-native weeds such as Himalayan blackberry. For purposes of the Final EIS, impacts on buffer areas within the 30-foot-wide operational right-of-way under the elevated guideway are included as a permanent impact. Sound Transit would re-evaluate this assumption during the permitting phase of the project to identify specific situations where buffer vegetation under the elevated guideway structure could be restored (where the guideway would be high enough to allow rain during the growing season).

Vegetation within buffer areas receives water directly from precipitation. Therefore, the elevated guideway may create a rainshadow effect and in some cases may have a low clearance that could also limit sunlight. At several locations along Sound Transit's Central Link route, project wetland specialists observed places where vegetation within buffers under the elevated guideway was having difficulty re-establishing because of limited summer water and/or light.

Estimating this impact is complicated and depends on multiple variables, such as slope, aspect, soil conditions, and stormwater dispersion from the elevated guideway. All these variables make for a complicated buffer impact analysis that exceeds the site and design information available during the Final EIS.

A 2009 study on shading impacts on vegetation was conducted for the SR 520 I-5 to Medina: Bridge Replacement and HOV Project (Parametrix et al., 2009). The study synthesized the results of four previous studies, including in situ light and vegetation measurements at several locations on SR 520 and I-90. The study was specific to two wide interstate bridge structures across Lake Washington, which are considerably wider than the elevated guideways proposed for the light rail system. However, some general conclusions from the study can be applied to the East Link Project. For example, the study found that the low, wide SR 520 bridge decks create deep shade beneath the bridge. The study also concluded that higher, narrower bridge decks can let in substantial amounts of light and more light reaches the ground or water surface area underneath these structures; vegetation cover (including trees and dense shrubs) can be quite high in these areas. The elevated guideways will generally be higher and much narrower than the SR 520 bridges studied. Therefore, substantial vegetation growth is expected to be possible under the high elevated guideway sections.

1.4.1.2 Permanent Operational Impacts

The permanent impacts on aquatic resources may include beneficial impacts (improved habitat conditions or fish passage) and adverse impacts when stream channels are either enclosed within new culverts or shaded by overhead guideways (i.e., riparian function impacts). Sound Transit assumes that an overhead structure 30 feet wide extending over stream channels or riparian vegetation could result in potential shading. The width of riparian vegetation used to calculate the area of impact is defined by the Cities of Bellevue and Redmond CAOs and varies by stream type. Additional permanent impacts may include stormwater runoff to surface waters and accidental spills during operation of the maintenance facilities.

For vegetation and wildlife resources, the permanent project limit is the width of the trackway (30 feet) and stations (approximately 60 feet by 380 feet) after construction. Removal of high-quality habitat supporting wildlife functions within the project limit would be permanently affected by project facilities and considered to have direct permanent impacts. Impacts of operational noise on wildlife would likely be relatively minor compared to existing traffic noise. To prevent trees and branches from interfering with operation of the light rail, existing high-quality, forest-dominated vegetation and wildlife habitat under and within 20 feet of each side of the elevated guideways would be converted to shrub and short-tree habitat, which may become high-quality habitat for some species. Existing low-quality, weed-dominated and disturbed vegetation and wildlife habitat under and within 20 feet of each side of the elevated guideways would be converted to shrub and short-tree habitat, which would be a substantial environmental improvement.

Permanent wetland impacts resulting from removal of wetland area and function are those that would occur within the project limits of the project alternatives (i.e., at-grade alternatives, columns for elevated alternatives, stations, maintenance facilities, park-and-ride lots, traction power substations, permanent access roads, stormwater facilities, and road widening). Sound Transit assumes that these areas would be permanently affected and all wetlands and/or buffers within these areas would be lost. Additional permanent impacts might also include stormwater runoff to surface waters during operation of the light rail facilities (see Section 4.9, Water Resources, in the Final EIS).

1.4.2 Site Restoration

For purposes of analysis and discussion of temporary impacts, Sound Transit assumed that areas supporting native upland or wetland vegetation and streambanks located outside of the project limits would be restored to their former condition after completion of construction. Site restoration features would be installed immediately following construction in each project segment. As noted above, the length of time that would be required for site restoration to effectively replace pre-project wetland functions would vary.

1.4.3 Avoiding and Minimizing Impacts on Sensitive Ecosystem Resources

Appendix A of this report provides a compilation of BMPs that could be used to avoid or minimize project construction and operational impacts on sensitive natural resources, including state and federal protected species and their habitats, wetlands, and aquatic resources. These BMPs are either required by state or federal agencies to obtain the permits that would be necessary for the project or may be required to comply with permit conditions. Sound Transit assumes that these BMPs would be implemented at appropriate locations and that they would perform as intended to avoid or minimize impacts.

This page intentionally left blank.

Chapter 2

Study Objectives and Methods

This chapter describes the objectives and methods used to study the aquatic resources (Section 2.1), vegetation and wildlife resources (Section 2.2), and wetland resources (Section 2.3).

2.1 Aquatic Resources

This section describes the objectives of the aquatic resources investigations and the methods used to characterize aquatic resources within the study area and identify potential impacts on those habitats.

2.1.1 Aquatic Resources Study Objectives

The purpose of the aquatic resources investigation was to describe the aquatic resources in the East Link Project vicinity and the potential impacts on these resources. Objectives included the following:

- Identify important fisheries resources, such as anadromous and resident species reported to inhabit water bodies within the study area. Describe relevant aspects of salmonid seasonal use and life histories.
- Identify any federal- or state-listed endangered, threatened, or candidate aquatic species reported to inhabit water bodies within the study area.
- Conduct a reconnaissance-level physical habitat survey of water bodies within the study area that may potentially be affected by all project alternatives to describe fish and amphibian habitats and riparian conditions.
- Conduct a quantitative physical habitat survey of streams within the study area that may be affected by the preferred alternative routes.
- Describe potential impacts on aquatic resources that may result from the project alternatives, including temporary construction impacts and permanent operational impacts.
- Propose mitigation measures to avoid, minimize, and compensate for any adverse impacts.

2.1.2 Aquatic Resources Methods

2.1.2.1 Review of Existing Information

Sound Transit performed a literature and data review to identify and characterize potentially affected resources in the study area. Sound Transit reviewed the sources listed in Section 1.1 to collect information regarding the presence of streams, rivers, and lakes and the resident and anadromous fish species and habitat within and near the study area. Existing documentation and information were compiled and reviewed first so that the field reconnaissance effort could focus on filling information gaps.

2.1.2.2 Agency Coordination

Federal, state, and local agencies were contacted for information regarding existing conditions in the study area. For example, WDFW was contacted for information on PHS. The Washington Conservation Commission provided a copy of the Lake Washington watershed habitat limiting factors report (Kerwin, 2001). Kit Paulson with the City of Bellevue provided information on species occurrence, habitat, watershed conditions, spawner surveys, and fish passage assessments at culverts for streams in the Kelsey Creek watershed.

2.1.2.3 Reconnaissance of Water Bodies

Sound Transit conducted reconnaissance-level aquatic habitat surveys during March 2007 at least 100 feet upstream and 300 feet downstream from each of the study area water-body crossings and along the entire reach of any stream running parallel to the project within 200 feet from the edge of the alternative and facilities. Aquatic habitat suitability (i.e., functional status) was evaluated based on the fish life histories, spawning and rearing habitat requirements, seasonal use, and field observations. The following stream habitat information was assessed during field reconnaissance:

- Overall habitat quality rating
- Habitat quality trend
- Water quality
- In-stream habitat
- Riparian habitat

2.1.2.4 Anthropogenic factors

The habitat quality rating was subjective. The fisheries biologists who determined the ratings have extensive experience doing quantitative stream habitat surveys using King County methods (1991); the Urban Stream Baseline Assessment Evaluation Method (USBEM); Timber, Fish, and Wildlife (TFW) methodology (Scheuett-Hames et al., 1994); and other methods. They have experience applying data to rating systems such as USBEM, National Oceanic and Atmospheric Administration (NOAA) Fisheries Pathways and Indicators, and others. The USBEM method was developed for King, Snohomish, and Pierce counties for ESA compliance purposes (R2 Consultants et al., 2000). In addition, aquatic resources were described, when possible and applicable, in a subbasin or drainage area context. Culverts were described and visually assessed for fish passage.

2.1.2.5 Detailed Analysis of Preferred Alternative

Sound Transit conducted quantitative aquatic habitat surveys in September 2009 at the stream crossings along the preferred alternative routes. Two methods were used:

- Crossings without anticipated impacts were assessed using the King County level one method with a Wolman pebble count added (King County, 1991).
- Crossings where impacts were anticipated were assessed using the watershed assessment method developed for the TFW program by Scheuett-Hames et al. (1994).

The King County method was used because it is the most widely used method in urban settings within King County and thus has the best comparative value. The TFW method was used at the request of the Muckleshoot Indian Tribe. Both methods give a quantitative assessment of stream habitat conditions.

2.1.2.6 Water Body Classification and Stream Buffer Width Designations

Water body classification was determined based on the King County, DNR, City of Redmond, and City of Bellevue classification systems. The King County system is hierarchical and based on stream flow and salmonid usage. The King County system categories are as follows:

- Class 1: Streams that are designated as “Shorelines of the State”
- Class 2: Streams that are smaller than Class 1 and flow year-round during years of normal rainfall, or those used by salmonids
- Class 3: Streams that are intermittent or ephemeral during years of normal rainfall and are not used by salmonids
- Unclassified: A watercourse that has been identified but has not been classified

The DNR classification system categories are as follows:

- Type S: Shorelines of the State or Shorelines of Statewide Significance
- Type F: Fish
- Type Np: Nonfish – Perennial
- Type Ns: Nonfish – Seasonal
- Letter U: Unknown

The City of Bellevue classification system categories are as follows:

- Type S water: All waters, within their bankfull width, as inventoried as “shorelines of the state,” including periodically inundated areas of their associated wetlands

- Type F waters: Segments of waters that are not Type S waters and that contain fish or fish habitat, including waters used by hatcheries
- Type N waters: All segments of waters that are not Type S or F waters and that are physically connected to Type S or F waters by an aboveground channel system, stream, or wetland
- Type O waters: All segments of waters that are not Type S, F, or N waters and that are not physically connected to Type S, F, or N waters by an aboveground channel system, stream, or wetland

The City of Redmond classification system categories are as follows:

- Class I: Streams identified as Shorelines of the State under the City of Redmond Shoreline Master Program
- Class II: Natural streams that are not Class I and are either perennial or intermittent and have salmonid fish use or the potential for salmonid fish use
- Class III: Natural streams that are not Class I or Class II and are either perennial or intermittent and have one of the following characteristics:
- Non-salmonid fish use or the potential for non-salmonid fish use
- Headwater streams with a surface water connection to salmon-bearing or potentially salmon-bearing streams (Class I or II)
- Class IV: Natural streams that are not Class I, Class II, or Class III and are either perennial or intermittent, do not have fish or the potential for fish, and are non-headwater streams
- Intentionally Created Streams: Manmade streams defined as such in these regulations, and which do not include streams created as mitigation; purposeful creation must be demonstrated to the City of Redmond through documentation, photographs, statements, and/or other evidence; intentionally created streams may include irrigation and drainage ditches, grass-lined swales, or other artificial watercourses unless they are used by salmonid fish or created for the purpose of stream mitigation.

Cities and counties (in areas that are not incorporated) have jurisdiction over stream buffers, which are regulated through the city's CAOs. Table 2-1 lists the stream buffer widths for the various stream classifications. The City of Redmond has different restrictions in the "inner" and "outer" portions of regulated buffers.

TABLE 2-1
Classification and Buffer Requirements for Streams Located in the Study Area

Stream Classification System	Stream Type/Class	Stream Buffer Requirements (feet)
City of Bellevue	Type S	100
	Type F	100
	Type N	50
	Type O	25
City of Redmond	Class I	150 (inner), 50 (outer)
	Class II	100 (inner), 50 (outer)
	Class III	100
	Class IV perennial	36
	Class IV intermittent	25

City of Bellevue Critical Areas Ordinance (2006) (Land Use Code 20.25H.025).
City of Redmond Critical Areas Ordinance (2005)

2.1.2.7 Impact Assessment

Sound Transit evaluated potential impacts of the East Link Project on aquatic resources by overlaying the map of the project design on the habitat characterization map created for the project; including the location and size of storm drain pipes and stormwater treatment/detention ponds. Sound Transit reviewed proposed construction staging areas and construction methods to determine where erosion, dust, and vegetation disturbance/removal would directly or indirectly affect tributaries in the study area. Sound Transit also evaluated reports and assessments of similar projects.

2.2 Vegetation and Wildlife Resources

This section describes the objectives of the vegetation and wildlife investigations and the methods used to characterize the vegetation and wildlife habitats within the East Link Project vicinity and to identify potential impacts on those habitats. It includes a discussion of threatened and endangered species, species of concern, and high-value habitats within the vegetation and wildlife study areas.

2.2.1 Vegetation and Wildlife Resources Study Objectives

The purpose of the vegetation and wildlife investigations was to describe the ecological resources in the study area and identify and describe potential impacts of the light rail system on them. Objectives included the following:

- Identify important terrestrial habitats and wildlife resources, such as migratory and resident species reported to occupy habitats within and adjacent to the project
- Identify any federal- or state-listed endangered, threatened, or candidate species that may occur within the study area
- Identify suitable habitat for any federal-or state-listed endangered, threatened, or candidate species that may occur within the study area
- Conduct a reconnaissance-level survey of terrestrial habitats to describe plant communities and wildlife habitats within the study area that might be affected by the project
- Describe potential impacts from the project's build alternatives on plant communities and wildlife habitats, including temporary construction impacts and permanent operational impacts
- Propose mitigation measures to avoid, minimize, or compensate for any adverse impacts

2.2.2 Vegetation and Wildlife Resources Methods

2.2.2.1 Review of Existing Information

Sound Transit obtained and reviewed existing data on study area plant communities, wildlife, and wildlife habitat from several sources, including local, state, and federal agencies. Sound Transit also obtained and reviewed existing maps and aerial photographs of the study area.

General wildlife guides, including Peterson guides to mammals, birds, and butterflies, were used to obtain basic distribution maps and general habitat requirements. More detailed distribution and status information was gathered from gap analysis data from the University of Washington (Smith, et al., 1997), *Wildlife-Habitat Relationships in Oregon and Washington* (Johnson and O'Neil, 2001), *Atlas of Oregon Wildlife* (Csuti et al., 1997), and *Ecology and Conservation of the Marbled Murrelet* (Ralph et al., 1995). Wildlife and plant databases were also accessed using internet resources; the NatureServe database (NatureServe, 2007) was one of the primary sources of information for plants and wildlife. Other sites used include the University of Montana's Butterflies and Moths of North America website (2007), the WDNR (2005), and the plant database for the United States Department of Agriculture (2007).

2.2.2.2 Identification of Threatened and Endangered Species and Species of Concern

Sound Transit analyzed the likely presence or absence of listed wildlife and plant species based on their known distributions and the presence of suitable habitat within the project vicinity, referred to as high-value habitat in this analysis. This process was also conducted to narrow the list of federally and state-listed species present in each of the project segments.

USFWS was contacted regarding federally listed plants and animals that may occur in the project vicinity. Data regarding the distribution of ESA-protected species were obtained from the USFWS online database (2007c).

Publications and general occurrence and distribution data for rare wildlife and plants were obtained from the WNHP website (2007). WNHP maintains site-specific data regarding rare, endangered, threatened, and sensitive wildlife, plants, and important ecological communities. WNHP publications that were reviewed included the currently updated version of the 1997 *Endangered, Threatened and Sensitive Vascular Plants of Washington* (WNHP, 1997), *Plant Associations in Washington's Puget Trough Ecoregion* (WNHP, 2007a), *Known High-Quality Rare Ecological*

Communities by (Washington) County (WNHP, 2007b), and *Washington Herp Atlas* (an online atlas of information on rare amphibians and reptiles) (DNR et al., 2005).

Priority species in Washington include all state endangered, threatened, sensitive, and candidate species, as well as federal endangered, threatened, candidate, and species of concern. State monitor species are not considered priority species but are monitored for status and distribution. They are managed by the WDFW, as needed, to prevent them from becoming endangered, threatened, or sensitive. WDFW maintains several geographic information system (GIS) databases that contain information on priority species in Washington. Sound Transit obtained data regarding rare species and habitats from the WDFW PHS database. In addition to publicly available information, WDFW provided site-specific data regarding the occurrence of rare plant communities, plants, wildlife, and wildlife habitat in the project vicinity in response to a project-specific request for these data. WDFW publications that were reviewed included *Priority Species and Habitats* and several volumes of *Management Recommendations for Washington's Priority Species* (WSFW, 1991).

Further literature reviews were required to determine whether habitat suitable for any state priority or listed species occurred within the project vicinity. This research was necessary because of the nature of PHS wildlife distribution data, which typically are very complete for larger, higher-profile species that are easily monitored and for which there are active monitoring efforts, but are often less comprehensive for lower-profile species.

Sound Transit used additional literature review combined with general habitat determinations for each affected potential habitat area to evaluate habitat suitability and potential presence for all PHS wildlife species occurring and likely occurring within the study area. Species that are not likely to occur in the study area were removed from consideration. Species occurrence in the study area was further assessed based on the habitat requirements of that species, habitats present in the study area, the location of known populations, and whether any historical or recent sightings of that species have occurred in King County. Any species that fit those criteria were added as either known to occur in the study area, likely present (i.e., having known historical or recent sightings and suitable habitat present), possibly occurring (i.e., habitat requirements fulfilled at the site and populations known to occur in the study area), or rare in the study area.

High-value habitats are identified as areas with unique or significant value to many species. These areas are not protected by state regulations. However, WDFW has developed management guidelines for land use activities that may affect high-value habitats. Field investigations were conducted in March and April 2007 to verify any priority species or habitats identified by WDFW and to assess potential impacts on these resources from the East Link Project.

Field investigators also surveyed low- and moderate-value habitats to assess their use to wildlife species, and cumulative impacts within the study area for low- and moderate-value habitats. These habitats might potentially be used by a variety of wildlife species, including priority species, though their expected occurrence is lower than for high-value habitats. Research indicates that low- and moderate-value habitats in an urban setting may still be important for some wildlife as they are often used to meet a specific need or life cycle (Marzluff et al., 2001).

2.2.2.3 Coordination with Agencies and Interest Groups

Local, state, and federal agencies were contacted for information regarding existing site conditions for areas located within the study area. The King County DNR, the King County Parks Department, the City of Bellevue Parks Department, WDFW, and USFWS were contacted for information regarding the presence of sensitive or protected habitats, wildlife, and plant species. Sound Transit met with representatives of the Muckleshoot and Snoqualmie Tribes to discuss their concerns regarding the project.

Robert Schafer from the City of Bellevue Parks and Community Services Department provided a list of special-status and listed species for Mercer Slough (Schafer, 2007). Sharon Claussen of the King County Parks Department provided design maps of the mitigation wetland located in Marymoor Park (Claussen, 2007). Bill Ritchie of WDFW was contacted for additional information regarding the protective buffers for bald eagle (*Haliaeetus leucocephalus*) nests located in the study area (Ritchie, 2007). Cathy Beam from the City of Redmond offered information on the status listing and management of red-tailed hawks and great blue herons within their jurisdictional boundaries (Beam, 2007).

Sound Transit also discussed the East Link Project with interest groups such as Friends of Mercer Slough and Friends of Marymoor Park to obtain additional information about the particular area and potential impacts.

Michael Hobbs from Friends of Marymoor Park provided a detailed history on the two bald eagle nests and the status of the purple martin *(Progne subis)* and osprey *(Pandion haliaetus)* nests at Marymoor Park (Hobbs, 2007a and b). In addition, Don Norman from Norman Wildlife Consulting and Herons Forever provided information regarding the status of the historical heronry on SE Leary Way in Redmond (Norman, 2007a and b).

2.2.2.4 Vegetation Classification, Mapping, and Field Investigations

The system used to classify vegetation types within the study area was based on the accepted vegetation classification system used for Sound Transit's Central Link Project (Sound Transit, 1999), which was developed from the King County Wildlife Habitat Profile (1987). However, there are several differences between the basic characteristics of the vegetation types used for the East Link Project and those described by Sound Transit for the Central Link Project. For the East Link Project, the mapped vegetation types included the following and described in Table 2-2 (for more description, see Section 3.2 of this report):

- Riparian forest
- Urban mostly vegetated – coniferous forest
- Urban mostly vegetated – deciduous forest
- Urban mostly vegetated – mixed forest
- Urban moderately vegetated
- Urban sparsely vegetated
- Blackberry

TABLE 2-2
Vegetation Types and Associated Wildlife Habitat Value for East Link Project

Vegetation/Habitat Type[a]	Description	Habitat Value
Riparian forest	Vegetated banks along river and stream edges. Often dominated by willow and red alder. Large big-leaf maple, black cottonwood, and red alder trees might occur. Non-native shrubs (Himalayan blackberry and Scot's broom), grasses, thistles, and other weeds are common.	High
Urban mostly vegetated – coniferous forest	Forest patches generally dominated by Douglas-fir with lesser amounts of black cottonwood, big-leaf maple, red alder in the overstory. Occasionally shore pine and red cedar. Canopy cover variable but generally greater than 40 percent. Douglas-fir trees mostly taller than 50 feet. Shrub layer often dominated by Himalayan blackberry but also includes salmonberry, snowberry, salal, Indian plum, rhododendron, and others. Herb layer, when present, includes grasses, sword fern, fringe cup, and nettles.	High
Urban mostly vegetated – deciduous forest	Forest patches with black cottonwood, big-leaf maple, red alder (40 to 70 feet tall), and few conifers in the overstory. Canopy cover 40 to 80 percent. Understory tree cover may include big-leaf maple, black cottonwood, red alder, and Pacific madrone. Shrubs similar to those of coniferous forest type.	High
Urban mostly vegetated – mixed forest (coniferous/deciduous)	A few small areas with a roughly even mix of deciduous trees and conifers in the overstory.	High
Urban moderately vegetated	Dominated by open mowed lawns. Large native and ornamental trees (generally 40 to 70 feet tall) also present. Some patches of ornamental and native shrubs may occur. Tree and shrub canopy cover values generally less than 30 percent.	Moderate
Urban sparsely vegetated	Commercial and industrial properties, road rights-of-way, and neighborhoods with a few or small patches of ornamental and native trees and considerable human activities.	Low
Blackberry	Areas dominated by blackberry were classified separately from riparian forest because of the much lower habitat value of blackberry-dominated areas.	Low
Open water	Highly variable community including saline and fresh waters, deep or shallow waters, rivers, creeks, and large water bodies.	High (except for Lake Bellevue)

[a] East Link vegetation types adapted from designations developed for the Central Link study area by Sound Transit (1999) from the King County (1987) Wildlife Habitat Profile.
[b] East Link wildlife values were modified from those assigned to the Central Link Project based on field observations.

Other habitat types, such as open waters and wetlands, are also mapped and addressed in other sections of this report. The first four vegetation types (riparian and urban mostly vegetated) are viewed as offering high-value habitat for a variety of wildlife species. For purposes of wildlife habitat, the last three vegetation types (moderately, sparsely, and blackberry vegetation) offer only moderate- or low-value habitat.

There are minor differences between the vegetation types used for East Link and those used for Central Link. For Central Link, Sound Transit described the urban, mostly vegetated type as "dominated by open mowed lawns; large native and ornamental trees (generally 40–70 feet tall); some patches of ornamental and native shrubs may occur" and assigned a high habitat value rating to these areas (Sound Transit, 1999). During the East Link study, however, Sound Transit did not find areas with mowed lawns and enough of an overstory of trees and shrubs to allow the areas to be classified as "mostly vegetated." Identified areas with characteristics approaching this condition were classified instead as urban, moderately vegetated for several reasons. First, Sound Transit mapped smaller polygons for East Link than were mapped for the Central Link analysis. This allowed areas with mowed lawns to be distinguished from areas with a more natural understory or ground cover. Second, and more important, the canopy cover of trees and shrubs described in Sound Transit's 1999 Central Link Project EIS was considerably lower than the canopy cover of more natural areas. These were classified for East Link as urban mostly vegetated—coniferous forest, urban mostly vegetated—deciduous forest, and riparian forest. Most of the areas classified as urban, moderately vegetated for East Link have higher habitat values than those classified by Sound Transit in 1999 because of the location of these areas and their connectivity or association with larger habitat patches.

Wildlife habitat values were not attributed to each occurrence of a vegetation type along the project corridor but instead were assigned to the vegetation type as a whole. Habitat value within a vegetation type at a specific location can vary and depends on several factors, such as size of the area; presence of (or proximity to) other valuable habitat; level and type of human disturbance; diversity of plant species; presence of multiple vegetation layers (i.e., tree, shrub, forb, and emergent layers); presence of threatened, endangered, or sensitive species; and extent of invasive weeds.

Areas within 100 feet of either side of the project alternatives that appeared to provide some level of potential value for wildlife were initially mapped using 1 inch = 200 feet scale color aerial orthophotographs (i.e., aerial photographs adjusted for topography, lens distortion, and camera tilt). Vegetation type polygons were classified and mapped regardless of size or upland/wetland designation. Vegetation type polygons were digitized onto aerial photographs (scaled at 1 inch = 200 feet) for subsequent use in field reconnaissance of the study area.

All vegetation polygons were visited during the field reconnaissance to verify the initial classification. The initial vegetation classification and polygon boundary was modified if needed based on the field review.

2.2.2.5 General Wildlife Habitat Value

Aerial photographs were used to locate all forested areas, which Sound Transit then assessed for plant diversity, plant density, and signs of wildlife use. Each of the urban mostly vegetated types (coniferous forest, deciduous forest, and mixed forest) and riparian forest polygons were assessed in the field by two biologists. A qualitative wildlife habitat functional value assessment form was adapted from the Washington State Department of Transportation (WSDOT) *Wetland Functions Characterization Tool for Linear Projects* (WSDOT, 2000) for use in evaluating general wildlife habitat value in the study area. The template for the data form is provided in Appendix B, and completed forms are available upon request. The qualitative functional value form assessed factors such as the following:

- Relative vegetation density, age, and growth form, and species and structural diversity
- Dominant plant species composition
- Location relative to sources of human disturbance
- General levels of development in the vicinity of the site
- Connectivity to other areas of valuable wildlife habitat
- Presence of movement barriers
- Presence of water and, if present, water type
- Specific factors affecting the potential habitat value for amphibians, mammals, and birds

These qualitative wildlife habitat assessment forms were not completed for wetlands because a separate wetland functional assessment form was used for those areas (see Section 2.3, Wetland Resources). The results of the wetland delineation and wetland functional assessment were used to identify important wildlife habitats of wetlands. These data were used to supplement information received from WNHP and WDFW, which covered both upland and wetland species.

2.2.2.6 Impact Analysis

Vegetation and Habitat

Expected impacts from project construction and operations on vegetation and wildlife habitat were determined by evaluating the acreage of major vegetation types that would be directly or indirectly impacted by the alternatives.

Wildlife

Sound Transit assessed impacts on wildlife using several approaches, including quantitative and qualitative methods, and measured direct habitat loss based on the extent of impacts to various plant communities. The qualitative assessment was accomplished based on factors, such as the regional significance of the habitat, its value (such as a site's role as a wildlife movement corridor), the degree of fragmentation and loss of the habitat following project implementation, overall habitat quality, and the potential for enhancing or restoring unique plant communities or wildlife habitat or connectivity.

Temporary construction and permanent operational impacts on wildlife, including disturbances from increases in human access, noise, light, and habitat fragmentation, were also evaluated. Information presented by the USFWS regarding the impacts of noise on wildlife was used to assist in this aspect of the analysis (USFWS, 2007a). The potential for the introduction and/or removal of noxious and/or invasive species invasions because of the project were also evaluated. Impacts on rare species were assessed by considering both direct habitat loss and indirect impacts from habitat loss and human disturbance.

A program called VIEWSHED GIS was used to determine potential impacts on bald eagles. The program predicts whether project construction activities occurring with the one-half-mile nest buffer could be seen from each of the eagle nest sites. Recorded features include the presence of large hills or open areas and the position of the nest or roost in the landscape. The program also considers topographic features to conduct the analysis. When the required data are gathered, viewsheds are created using the VIEWSHED GIS software. These viewsheds show the lands within one-half mile that are visible from each bald eagle nest or roost. Potential impacts are assessed based on distances between bald eagle nests or roosts and construction areas and whether there is an unobstructed line-of-sight between the nest or roost and construction areas.

2.3 Wetland Resources

2.3.1 Wetland Resources Study Objectives

Earlier project reconnaissance findings show that wetlands are located within the construction limits for several project alternatives. As a result, specific objectives of this analysis include the following:

- Catalog the existing conditions of the wetlands and wetland buffers located within 200 feet of either side of the proposed project alternatives.
- Determine each project alternative's temporary construction and permanent operational impacts on wetlands.
- Describe measures to avoid, minimize, or compensate for impacts.

2.3.2 Wetland Resources Methods

Wetlands were identified through existing mapping inventories and published documents, field evaluations, and communications from various agencies. Federal, state, and local regulations were referred to assist in classifying and rating wetlands and to confirm project compliance with existing laws.

2.3.2.1 Review of Existing Information

Existing wetland data were gathered from a variety of sources—including federal, state, and local agencies—reviewed in the office, and then evaluated in the field. Existing digital GIS information was obtained from the

Cities of Bellevue and Redmond, and the USFWS National Wetlands Inventory (NWI). The NWI database was the primary wetland mapping tool used.

2.3.2.2 Agency Coordination

During this review, several state and local agencies were contacted. The Cities of Bellevue and Redmond were contacted regarding their wetland map inventories. WSDOT was contacted for permission to access the Mercer Slough wetlands along the Interstate 90 (I-90) overpass and for information regarding the wetland existing on the old WSDOT property adjacent to 118th Avenue SE in Bellevue. The King County Parks Department was contacted for information regarding the Marymoor Park mitigation wetland. Construction plans for the mitigation wetland were obtained and permission granted for accessing the site for evaluation.

2.3.2.3 Wetland Determination

General field reconnaissance work was completed in February and March 2007 for the East Link Project using aerial photographs from 2005. The aerial photographs were at a scale of 1:24,000 (1 inch = 200 feet) and were used to evaluate existing mapped wetlands and to help pinpoint potential sensitive areas that were not included in any of the wetland maps or inventories. To determine whether wetlands were present, potential existing wetland data were plotted onto the aerial photograph map books created for the project, and the East Link Project alternatives were then added to the map books with 100-foot boundaries from the centerline. The boundary widths were placed on either side of the centerline to expand the study area in case the centerlines were shifted or adjusted along their route. In addition, Sound Transit examined an additional 200 feet on either side of the project alternatives to locate any additional wetland resources that might have been omitted from the existing wetland inventories and maps and that might have included buffers that intersect the study area.

The *2004 Washington State Wetland Rating System for Western Washington Manual* (Ecology publication #04-06-025) (Hruby, 2004) was used to determine the presence, class, and category of wetlands in the study area. For the Draft EIS, reconnaissance-level wetland assessments were completed for all alternative routes. Formal wetland delineation was conducted in 2009 for the *Preferred Alternative* routes identified as part of the Final EIS. Using the Ecology manual, each of the potential wetland sites was evaluated for the presence or absence of hydric soils, the dominance of hydrophytic vegetation, and the presence or absence of wetland hydrology. A discussion of these three wetland criteria is included in the methodology sections below. Once the sites were visited, if they were classified as wetlands, they were added into the project database and identified on project maps.

Soils

To help locate potentially missed wetland sites, Sound Transit used data obtained from the USDA Natural Resources Conservation Service (2008) and from King County (King County GIS Data, 2007)) to create 1:2,400 mapbooks that show the different soil boundaries and soil types within the study area. Before entering a site, the mapped soil types were verified to be either hydric or nonhydric soils. This information was especially useful for areas in the City of Bellevue and Bel-Red corridor area because access to several properties was not allowed. Wetland soil determinations were based on existing soil classification for the following known wetland complexes: Bear Creek (WR-12), West Tributary to Kelsey Creek Ponded (WR-7), West Tributary to Kelsey Creek Riparian (WR-8NW, WR-8N, and WR-8SE), 118th Avenue SE (WR-5), and Mercer Slough/I-90 (WR-4) wetlands.

In areas where property access was allowed, Sound Transit dug 16-inch-deep soil pits to view the soil profile. Soil matrix color was noted using a Munsell Soil Color Chart (Greytag Macbeth, 2000). Matrix texture was also noted. Within the upper 12 inches of the soil profile, soils were only considered wetland soils if the soil chroma had a value of 2 or lower with redoximorphic features on the Munsell Soil Color Chart, or with a value of 1 or lower without such features. If redoximorphic features were present in the soil, the color, size, abundance, and texture were noted. Soil pits were dug in 8 of the 13 wetlands located within the study area. Soil pits were not dug in the other wetlands because access restrictions were not resolved at the time of the Draft and/or Final EIS. Wetland data at the WSDOT property located east of 118th Avenue SE were obtained from the *I-405 Bellevue Nickel Improvement Project Wetlands Discipline Report* (WSDOT, 2006).

Vegetation

Plant communities were evaluated in February and March 2007 to determine the presence and dominance of hydrophytic vegetation. Deciduous and herbaceous species were still dormant during this time of year, so dormant shrubs and trees were identified by bark, branch growth patterns, and fallen leaves around the base of the plant. Herbaceous vegetation was identified by last year's growth, which was still evident on most species.

Hydrophytic vegetation exists when more than 50 percent of the dominant plants in each strata (i.e., tree layer, shrub layer, and/or herb layer) are either obligate, facultative wetland, or facultative indicator plants (Table 2-3). Wetland indicator status was determined using the 1996 *National List of Vascular Plant Species That Occur in Wetlands* (Reed, 1988).

TABLE 2-3
Wetland Plant Indicator Status

Indicator Status	Indicator Symbol	Wetland Definition
Obligate Wetland Plants	OBL	Plants that occur almost always (estimated probability >99%) in wetlands under natural conditions, but which might also occur rarely (estimated <1%) in nonwetlands
Facultative Wetland Plants	FACW	Plants that occur usually (estimated probability >67 to 99%) in wetlands, but which also occur (estimated probability 1 to 33%) in nonwetlands
Facultative Plants	FAC	Plants with a similar likelihood (estimated probability33 to 67%) of occurring in wetlands and nonwetlands
Facultative Upland Plants	FACU	Plants that occur sometimes (estimated probability 1 to <33%) in wetlands, but which occur more often (estimated probability >67 to 99%) in nonwetlands
Obligate Upland Plants	UPL	Plants that occur rarely (estimated probability <1%) in wetlands, but occur almost always (estimated probability >99%) in nonwetlands under natural conditions

Source: Reed, 1988

Hydrology

The hydrology of each site was also evaluated during February and March 2007. Signs of water were followed toward their sources. Indicators of wetland hydrology, including water-stained vegetation and debris dams, were noted. Aerial maps were used to determine the water sources and where to extend the search.

2.3.2.4 Wetland Functions and Classification

Wetlands were classified following federal and state guidelines. The Cowardin system (Cowardin et al., 1979) was used to define and describe the vegetation characteristics of wetlands in the study area (Table 2-4). In addition, the Hydrogeomorphic Classification (HGM) (Brinson, 1993) for each wetland was ascertained using guidance found in the *Washington State Wetland Rating System for Western Washington Revised* (Hruby, 2004). The HGM classification system breaks wetlands down into categories based on their hydrodynamics, hydrologic source, and geographic setting (such as depressional, riverine, or slope).

TABLE 2-4
Cowardin Classifications of Wetlands Located within the East Link Study Area

Cowardin Classification	Definition
Palustrine Emergent (PEM)	Vegetation standing in a few inches to 3 feet of water. PEM are dominated by erect, rooted herbaceous freshwater hydrophytic vegetation.
Palustrine Scrub-Shrub (PSS)	Areas dominated by woody vegetation <6 meters (20 feet) tall. Woody shrub component consisting of shrubs and small trees.
Palustrine Forested (PFO)	Areas dominated by woody vegetation >6 meters (20 feet) tall.

Ecology's *Rating System for Western Washington* (Hruby, 2004) as adopted by local CAOs was used to determine the category of each wetland based on functional capabilities. Higher quality functions result in higher ratings, with Category 1 being the highest functioning wetlands and Category 4 the lowest. Wetland-buffer width varies with a given wetland category, which also varies with the specific jurisdiction (Table 2-5). Wetland buffers are not given their own category but are associated with the category of wetland they abut.

TABLE 2-5
Wetland Categories and Buffer Requirements for Wetlands Located in the East Link Study Area

Classification System	Wetland Category	Buffer Requirements[a,b]
City of Bellevue[b]	Category 1: Category 2: Category 3: Category 4:	75 – 225 feet 75 – 225 feet 60 – 110 feet 40 feet with no setback
City of Redmond [c]	Category 1: Category 2: Category 3: Category 4:	75 – 300 feet 75 – 300 feet 60 – 150 feet 40 – 50 feet

[a] Variations in buffer width are due to functional scores and other criteria for each jurisdiction. Similarly, variations in mitigation ratios are based upon the type of mitigation offered (e.g., creation, restoration, re-establishment) and the Cowardin class affected.
[b] All Category 1, 2, and 3 Wetlands in Bellevue have a 20-foot setback that prohibits placement of any structure within 20 feet of the wetland boundary.
[c] The impact of adjacent land use anywhere in the City of Redmond is at least moderate, so the narrowest possible buffers shown in the City of Redmond CAO would not apply.

Wetland buffers were added to mapped wetlands and shown on aerial maps to display the total wetland footprint (including both wetland and buffer) occurring within the construction limits of each project alternative. In some cases, existing buildings, parking lots, and roads within wetland buffer areas reduced buffer widths.

2.3.2.5 Wetland Functional Assessment

The functions and values that exist in each wetland and their level of performance were evaluated during site visits. The presence and quality of functions provided by each wetland resource were assessed using the *Washington State Wetland Rating System for Western Washington Revised* (Hruby, 2006). The rating system defines three main wetland functional categories (i.e., hydrologic, water quality, and habitat). The wetland rating scores for each function group can be converted into general groups (low, moderate, or high) according to the *Focus Sheet: Using the Wetland Rating System in Compensatory Mitigation* (Ecology, 2008).

Chapter 3

Affected Environment

The East Link Project would be constructed in a generally urban area with variable levels of existing human activity. Portions of the project would be constructed in highly urbanized cities such as Seattle, Bellevue, and Redmond or along heavily traveled highways, including I-90, I-405, and State Route (SR) 520. This chapter describes the affected environments for aquatic resources (Section 3.1), vegetation and wildlife resources (Section 3.2), and wetland resources (Section 3.3).

3.1 Aquatic Resources

The East Link Project would be constructed in an urban area that has already experienced a moderate to high degree of alteration to aquatic habitats. The degree of alteration varies from water body to water body, with the greatest alteration occurring where urban development is the greatest, such as some of the tributaries to Kelsey Creek and Sturtevant Creek in Bellevue. Some of the smaller streams and headwater reaches have been placed in long pipe systems. The least-altered stream in the study area is Bear Creek in Redmond. However, recent development in that watershed has been extensive.

3.1.1 Drainage System Configuration

The Lake Washington Watershed (i.e., WRIA 8) is composed of two major subbasins: the Sammamish River and the Cedar River. Table 3-1 lists the water bodies that would be potentially affected by the East Link Project. The Kelsey Creek system, the primary watershed with associated potential impacts from the project, is located in Segments B, C, and D. Exhibit 3-1 shows the water bodies in and around the study area.

3.1.2 Fish and Other Aquatic Species and Habitat

This section describes the aquatic species and habitat in the study area by segment. Exhibits 3-2 through 3-5 show streams and fish passage features along and nearby Segments B through E, respectively, within each related segment subsection in this chapter. (This results in some exhibits appearing out of sequence in this section.)

3.1.2.1 Segment A

Lake Washington is the second largest lake in Washington, with a surface area of 22,138 acres. The lake lies at an elevation of 22 feet. The lake is about 20 miles long, averages about 1.5 miles wide, and is oriented in a north-south direction. The maximum depth is 214 feet. The major sources of water that enter the lake are the Cedar River (55 percent of the average inflow) and the Sammamish River (27 percent of the average inflow). The remainder of inflow comes from May Creek, Kelsey Creek, Juanita Creek, Thornton Creek, Lyon Creek, and other, smaller creeks. The lake drains to Puget Sound through the Lake Washington Ship Canal, an artificial waterway constructed in 1916. The ship canal was built to allow ship traffic to access freshwater moorage in Lake Union and Lake Washington via the Hiram Chittenden (Ballard) Locks, which were built at the same time as the ship canal.

Many species of resident fish, both native and introduced, inhabit Lake Washington (Table 3-2). Several species of introduced fish are very abundant, such as yellow perch (*Perca flavescens*) and smallmouth bass (*Micropterus dolomeiui*). Many of these species were introduced when the live fish exhibit at the 1909 Alaska-Yukon-Pacific Exposition was released into Lake Washington. These include tench (*Tinca tinca*) and common carp *(Cyprinus carpio)*, both native to Europe.

TABLE 3-1
Description of Water Bodies Potentially Affected by the East Link Project

Water Body	Alternatives Crossing or Adjacent to Water Body[a]	WRIA Number	King County Class	WDNR Class	Local CAO Stream Class or Type and Buffer Width (ft)	Stream Length (miles)	Drainage Area (square miles)	Comments
Cedar River Subbasin								
Lake Washington	*Preferred A1*	8	1	S	NA:	NA	692	A regionally important lake and designated as a Shoreline of Statewide Significance.
Mercer Slough	*Preferred B2M*, B1, B2A, B2E, B3, B3 Design Option, B7	8-0059	1	S	Class Type S: Buffer: 100	1.2	2.1	Chinook gather at the mouth of Mercer Slough under the I-90 crossing. All salmonids destined for Kelsey Creek pass through Mercer Slough. Designated as a Shoreline of Statewide Significance.
Mercer Slough West	*Preferred B2M*, B1, B3, B3 Design Option, B2A, B2E	8-0059	1	S	Type F: Buffer: 100	1.2	2.1	Western channel between 112th Avenue SE and Bellefield Office Park. Designated as a Shoreline of Statewide Significance.
Sturtevant Creek	B3 Design Option, *Preferred C11A, C9T,* C1T, C2T, C3T, C4A, C7E, C8E, C9A, C14E	8-0262	2	F	Type: F Buffer: 100	1.0	1.2	Urbanized area results in rapidly fluctuating flow regimes.
Kelsey Creek	B7	8-0259	2	F	Type: F Buffer: 100	8.6	11.4	The largest stream in Bellevue. This is an urban stream of regional significance due to high presence of Chinook.
West Tributary to Kelsey Creek	*Preferred D2A*, D2E, D3, D5	8-0264	2	F	Type: N Buffer: 50	2.8	1.6	Pacific giant salamander documented. Urbanized area results in rapidly fluctuating flow regimes. Impassable culvert at Bel-Red Road, below the project study area.
Goff Creek	*Preferred D2A*, D2E, D3, D5, MF3	None	2	F	Type: F Buffer: 100	1.5	1.1	Impassable culvert at Bel-Red Road, below the project study area. Urbanized area results in rapidly fluctuating flow regimes.
Unnamed Tributary to Kelsey Creek	*Preferred D2A*, D2E, D3	None	3	Ns	Type: O Buffer: 25	Unk	Unk	Very small, intermittent. Urbanized area results in rapidly fluctuating flow regimes. Impassable culvert at Bel-Red Road, below the project study area.
Valley Creek	*Preferred D2A*, D2E, D3, D5	8-0266	2	F	Type: F Buffer: 100	2.5	2.2	Urbanized area results in rapidly fluctuating flow regimes.

TABLE 3-1 CONTINUED
Description of Water Bodies Potentially Affected by the East Link Project

Water Body	Alternatives Crossing or Adjacent to Water Body[a]	WRIA Number	King County Class	WDNR Class	Local CAO Stream Class or Type and Buffer Width (ft)	Stream Length (miles)	Drainage Area (square miles)	Comments
Sears Creek	D3	8-0267	2	F	Type: F Buffer: 100	0.6	0.9	Most of drainage is piped. Urbanized area results in rapidly fluctuating flow regimes.
Sammamish River Subbasin								
Sammamish River	*Preferred E2*, E1, E4	8-0057	1	S	Class: I Buffer: 150	13.8	240	All salmonids destined for Bear and Issaquah creeks pass through the Sammamish River.
Bear Creek	*Preferred E2*, E1, E4	8-0105	1	S	Class: I Buffer: 150		50	Identified as one of the top six natural resource drainages in King County. Designated as a Shoreline of Statewide Significance.

Note: Alternatives not listed would not affect any water bodies.

E4 = Leary Way
MF3 = Maintenance Facility 3

Five species of anadromous salmonids are resident to the Lake Washington Watershed (sockeye, Chinook, coho, steelhead, and sea-run cutthroat trout). Table 3-3 lists the species present and their stock status. Anadromous fish are those species that begin their life in freshwater, migrate to the ocean to rear, and then return to freshwater as adults to spawn. The most abundant of these is sockeye salmon (*Oncorhynchus nerka*). Sockeye is the only species to rear in the lake for a whole year as juveniles. Sockeye enter the lake as adults starting in June and remain until September, when temperatures drop in the tributary streams where they spawn. The primary spawning areas are in the Cedar River, Issaquah Creek, and Bear Creek, but substantial numbers also use nearly all of the larger tributary streams, including Kelsey Creek. Juveniles enter the lake as fry during late winter and early spring, and most rear in the lake for one year. Sockeye smolts leave the lake in spring to enter Puget Sound, and then migrate to the open ocean. A resident form of sockeye, called Kokanee, does not migrate out to sea but remains in fresh water throughout its life cycle.

Adult spawner Chinook salmon (*Oncorhynchus tshawytscha*) enter Lake Washington from early July through the end of October. Their residence time in the lake is thought to be relatively brief, although the early-arriving fish may linger if tributary temperatures are too high. When tributary temperatures drop in fall, Chinook migrate up into the tributary streams and rivers to spawn. There is a major hatchery program for Chinook at the Issaquah Creek hatchery and a smaller program at the University of Washington. All Chinook in the Lake Washington system are “ocean-type,” meaning they rear in freshwater as juveniles for only 3 to 6 months. There are two juvenile life-history variants in the population. One variant enters the lake as fry and rears in the lake until late spring/early summer before entering Puget Sound. The second variant rears in streams until late spring/early summer before migrating into and through the lake and out to sea. This second, and most common, variant does not spend much time in the lake.

TABLE 3-3
Summary of Stock Status in Lake Washington Watershed: Anadromous Salmonids

Species	Stock[a]	Stock Status	Stock Origin	Escapement Range[b]	Escapement Average	Production Notes
Summer/fall Chinook	Issaquah	Healthy	Non-native	500 – 5,000	2,000	Composite production[c]
Summer/fall Chinook	Cedar River	Unknown	Native	600 – 4,300	1,900	Wild production
Sockeye	Lake Washington	Healthy	Non-native	76,000 – 625,000	275,000	Wild production
Coho	Lake Washington/ Sammamish tributaries	Depressed	Mixed	Unknown	Unknown	Composite production[c]
Coho	Cedar River	Healthy	Mixed	Unknown	Unknown	Wild production
Steelhead	Lake Washington Basin	Depressed	Mixed	470 – 1,820	Unknown	Composite production
Cutthroat trout	Lake Washington Basin	Healthy	Native	Unknown	Unknown	Wild production

Source: WDFW et al. (1992); Kerwin (2001)
[a] A stock is an interbreeding population.
[b] Escapement = Number of fish that make it to the spawning grounds.
[c] Composite production: Hatchery plus wild production. Hatchery production is at the WDFW hatchery in Issaquah and to a lesser degree at the University of Washington hatchery.

Adult spawner coho (*Oncorhynchus kisutch*) begin entering Lake Washington around mid-August and continue through the end of January. Their residence time is variable. Spawning occurs in nearly all tributaries, including Bear Creek, Kelsey Creek, and Kelsey Creek tributaries. Juveniles enter the lake in April and May on their way out of the system after rearing in streams for 1.5 years. A few juveniles are thought to rear in the lake as well. A large number of coho are produced at the WDFW salmon hatchery in Issaquah, but most coho in the system are from natural production.

Steelhead and resident rainbow trout *(Oncorhynchus mykiss)* are present in the Lake Washington system but are not abundant. Adult spawner steelhead enter the lake starting in December and continue to enter the lake until April. They spawn in late winter and spring in tributary streams and rivers, including Bear Creek. Wild juvenile steelhead rear in tributaries for two years. Hatchery steelhead reared in the Issaquah hatchery rear for one year. Steelhead smolts move into Lake Washington from tributary streams in April on their way out of the system. They stay in the lake for a month or two, migrating out before mid-June (Kerwin, 2001). Resident rainbow trout are present in the lake all year long.

Coastal cutthroat trout in both resident and anadromous forms are present in Lake Washington in moderate abundance. Resident fish are present in the lake all year long. Sea-run cutthroat enter the lake in late winter and early spring to spawn in spring in tributary streams. Juveniles return to the lake at one to two years of age. The resident fish stay, and the anadromous smolts migrate out later in spring and early summer to rear in Puget Sound. Resident cutthroat trout are found in the smallest streams that can support salmonids.

Bull trout (*Salvelinus confluentus*) have been observed entering Lake Washington through the fish ladder viewing area at the locks, where every year, one or two fish are seen traveling into the lake. Many researchers believe that these fish are seasonal transient strays (i.e., not residents) rather than fish produced within the system. However, the USFWS assumes for regulatory purposes that natural production is possible in the system.

3.1.2.2 Segment B

Exhibit 3-2 shows the streams and fish passage features in Segment B. The primary features are discussed in the following subsections.

Mercer Slough

Mercer Slough is a remnant of a much larger embayment that was left after Lake Washington was drawn down 10 feet when the Montlake Cut connection between Lake Washington and Lake Union was established in 1916. Exhibit 3-2 shows the current location and extent of the slough. The Mercer Slough Nature Park (which contains most of the Mercer Slough water body and associated wetland complex) was part of this former bay of Lake Washington. The upper half mile of the slough is split into two channels—Mercer Slough East and West—by a large island with an office park on it. The distance from the Kelsey Creek outlet to Lake Washington is about 1.75 miles. The area that drains into Mercer Slough through Kelsey Creek is about 19,200 acres. The impervious surface area ranges from 32 to 68 percent of the drainage area. The slough is at the same elevation as Lake Washington, so the water input from Kelsey Creek does not result in any perceptible flow.

EXHIBIT 3-6
Mercer Slough along 112th Avenue SE

Mercer Slough averages about 40 feet wide and is probably no more than 8 feet deep (Exhibit 3-6). Although the bottom could not be observed due to turbidity during the study, it is reasonable to assume that the bottom is composed largely of organic material and silt. The upper end of Mercer Slough, just downstream of the Kelsey Creek outlet, may have some gravel and sand deposits from the creek. The habitat character would be better described as lake or lacustrine habitat rather than pool habitat morphology. There are no riffles, runs, or glides. The riparian area on the west side of Mercer Slough West is narrow in the vicinity of the office park (along 112th Avenue SE), averaging about 30 to 200 feet wide. Along the western bank of Mercer Slough West, the dominant vegetation is Himalayan blackberry (*Rubus armeniacus*), which is a state-listed noxious weed, and mowed lawn with only a few scattered shrubs and trees such as red alder (*Alnus rubra*), big-leaf maple (*Acer macrophyllum*), willow (*Salix* sp.), and Douglas-fir (*Pseudostuga menziesii*) or Sitka spruce (*Picea sitchensis*). The eastern bank of Mercer Slough West closest to the office park is dominated by lawn or a very narrow strip of vegetation such as Douglas spirea (*Spiraea douglasii*) and weeds such as reed canarygrass (*Phalaris arundinacea*). In the lower mainstem of the slough, south of where the east and west channels join, Mercer Slough is bordered on both sides by the Nature Park and the riparian area is very wide and largely dominated by native trees, shrubs, emergents, and some non-native noxious weeds.

Overall salmonid habitat quality, however, is poor due to the lack of riffles and gravel as well as high summer water temperatures. Salmon runs throughout the Kelsey Creek drainage pass through Mercer Slough as a migratory corridor. Some rearing function is possible, especially for coho during the cooler months. Run size varies from year to year. In 2006, escapement (the number of fish returning to the stream) was 229 Chinook, 503 sockeye, and 5 coho. Steelhead and cutthroat numbers are unknown because they were not surveyed.

Kelsey Creek

Kelsey Creek is one of the largest independent tributaries to Lake Washington. It has a drainage area of 2,816 acres. The mainstem is about 8.6 miles long, with headwaters at Phantom Lake in east Bellevue. Including tributaries, there are about 19 miles of open stream channels in the drainage. Kelsey Creek first flows north until the vicinity of Bel-Red Road, where it turns west, then south before flowing into Mercer Slough in south Bellevue. The impervious surface area is about 42 percent of the drainage area. Topographic relief through the drainage is 300 feet for an average slope of 0.7 percent, which is fairly gradual. Kelsey Creek has a number of tributaries, including the West Tributary, Goff Creek, Unnamed Tributary, Valley Creek, Sears Creek, Sunset Creek, and Richards Creek.

Kelsey Creek supports runs of anadromous salmonids, including Chinook salmon, coho salmon, sockeye salmon, and sea-run cutthroat trout. Steelhead are presumed to be present in this system, but this has not been confirmed. Resident fish include rainbow trout, cutthroat trout, sculpins, lampreys, and suckers. Peamouth migrate in from Lake Washington to spawn in lower Kelsey Creek, numbering in the thousands. Chinook are known to occur as far upstream as Larson Lake. Coho salmon are known to occur where Chinook occur, and probably farther upstream as well. Sockeye are known to spawn up to river mile 5.0 (which is upstream of the study area). A 2006 spawner survey for Kelsey Creek and tributaries estimated run size at 200 Chinook, 5 coho, and 503 sockeye (Watershed Company, 2007). Factors limiting the production of salmonids in Kelsey Creek and all its tributaries are those common to urban streams. Fine sediment levels are high in spawning riffles, which impairs egg survival and aquatic insect production. Logging and urban development have lowered pool density and channel complexity. Hydrology has been altered due to an increase in the amount of impervious surfaces, which causes higher peak flows and lower summer base flows. Stormwater draining from roadways and degraded riparian areas, which reduces shading, have caused water temperature to increase. Kelsey Creek is on the Ecology 303(d) list of streams with impaired water quality for exceeding allowable levels of fecal coliform bacteria and three pesticides: dieldrin, heptachlor epoxide, and dichloro-diphenyl-trichloroethane (DDT).

Overall salmonid habitat quality, however, is only fair due to sand embeddedness in riffles and gravel, low abundance of large woody debris (LWD), and high summer water temperatures. Salmon runs throughout the Kelsey Creek drainage pass through Mercer Slough as a migratory corridor.

In the vicinity of where the proposed BNSF Alternative (B7) would cross Kelsey Creek at 118 Avenue SE, the creek is in a culvert (Exhibit 3-7). On the upstream side of the Alternative B7 crossing, the creek is in a long but fish-passable culvert under I-405. On the downstream side of the crossing at 118th Avenue SE, the culvert outlet drops into a concrete fish ladder that empties directly into Mercer Slough. Habitat value in this reach is limited to a fish migratory corridor and is considered poor.

EXHIBIT 3-7
Kelsey Creek Fish Ladder downstream of culvert at 118th Avenue SE and I-405

Sturtevant Creek

Sturtevant Creek is a small, highly urbanized stream draining 773 acres of Bellevue, including much of the downtown area. This drainage is 1.9 miles long, starting in the vicinity of Lake Bellevue. The stream flows generally south, with its outlet at Mercer Slough. The topographic drop is 120 feet. All tributary inflow is through piped systems. The impervious surface area is 68 percent of the drainage area. As a result of the high percentage of impervious surface area and general lack of stormwater detention facilities, Sturtevant Creek has a highly “flashy” flow regime, meaning it is quick to peak after a rainfall event then a quick to drop back to base flow. Much of the drainage, including the mainstem, is in pipes and culverts. Chinook salmon, sockeye salmon, and cutthroat trout are known to use Sturtevant Creek up to I-405, where there is an impassable culvert next to the Hilton Hotel. The stream also supports peamouth spawning.

The SE 8th Street crossing is through a large-diameter, fish-passable culvert set into grade with a flat gradient and natural sand/silt substrate surface. The reach downstream is a short, deep glide backwatered by Mercer Slough. Banks are stable, and the narrow riparian area is moderately thick with mixed conifer and alder trees. The reach upstream between SE 8th Street and SE 6th Street is largely an unstable, narrow, incised glide with a silty bottom. It has the appearance of a channel that was once channelized straight through a wetland area then no longer maintained, and it is readjusting to site conditions by side-cutting to meander. It breaks into multiple channels in the wetland as a result of beaver activity. Riparian vegetation is patchy, alternating between willow and reed canarygrass. Spawning and rearing habitat quality is poor in this reach.

3.1.2.3 Segment C

Exhibit 3-3 shows the main streams and fish passage features in Segment C.

Sturtevant Creek

The reach of Sturtevant Creek beginning from SE 6th Street and moving northward up to I-405 improves in habitat quality steadily in the upstream direction until reaching the impassable culvert at I-405. Just upstream from the SE 6th Street crossing, the creek is generally a shallow, wide glide on sandy substrate. In this reach, the creek flows next to one office building and under another. There is no riparian vegetation in much of this reach. Spawning and rearing habitat quality is poor. Large woody debris is generally absent (one piece observed).

In the short reach adjacent to the Hilton Hotel, north of the SE 6th Street crossing (see Exhibits 3-3 and 3-8, where an elevated guideway might be located depending on alternative, the gradient increases and transforms into a pool/riffle complex (Exhibit 3-8). There is abundant gravel in the riffles, although the gravel is embedded 25 to 50 percent with sand, which reduces the quality of this spawning area. Although there is ample shade due to large bordering trees, all of the streamside cover of trees or shrubs have been cleared and lawn has been established on both sides. Despite this, stream habitat quality is considered good because there are pools and riffles with moderately clean gravel. This reach represents virtually the only usable spawning habitat in Sturtevant Creek for salmonids. The upstream end of this reach ends at the impassable I-405 culvert. Also, peamouth are known to spawn in Sturtevant Creek. The habitat components are as follows: 32 percent riffle, 42 percent glide, 12 percent pool, and 14 percent culvert. Most of the glide habitat is in the reach downstream of the Hilton Hotel (Exhibit 3-8).

EXHIBIT 3-8
Sturtevant Creek upstream of NE 8th Street

Sturtevant Creek leaves Lake Bellevue as a featureless glide in the ditch alongside of the former BNSF Railway tracks (Exhibit 3-9). Riparian vegetation is sparse and mostly grasses or blackberries. There is also a group of willows and cottonwood just below Lake Bellevue. The bottom substrate composition is silt and organic material. Habitat quality is poor. This reach is above two fish passage blocks.

09/25/2009 12:32

EXHIBIT 3-9
Sturtevant Creek next to Hilton Hotel at 114th Avenue SE

Lake Bellevue

Lake Bellevue is a small lake that forms the headwaters to Sturtevant Creek. It is entirely surrounded by offices and businesses, most of which are built on pilings in the lake. The only fish species known to be present in the lake is goldfish (*Carassius auratus*).

3.1.2.4 Segment D

Exhibit 3-4 shows the streams and fish passage features in Segment D.

West Tributary to Kelsey Creek

The West Tributary to Kelsey Creek starts in the vicinity of the I-405/SR 520 interchange. It flows southeast, then south, entering Kelsey Creek at river mile 2.6. There are 2.8 miles of open channel with many long culverts in this 1,001-acre drainage area. The average channel slope is gradual at 0.8 percent. The drainage is close to completely built out, with industrial areas in the upper reaches and residential developments elsewhere. The impervious surface area is 44 percent of the drainage area. Chinook salmon, coho salmon, sockeye salmon, and cutthroat trout have been reported in the lower reaches of the West Tributary. The current upstream limit to migratory fish is at Bel-Red Road. The City of Bellevue conducted electro-fishing at two upstream locations and caught no fish. They did, however, catch a Pacific giant salamander (*Dicamptodon tenebrus*).

09/28/2009 12:36

EXHIBIT 3-10
West Tributary to Kelsey Creek at detention pond (also Wetland WR-7)

Preferred NE 16th At-Grade Alternative (D2A) Crossing

Preferred Alternative D2A would cross the West Tributary to Kelsey Creek along the southern edge of a stormwater detention facility pond (Exhibit 3-10). The stormwater detention facility consists of a large concrete dam and associated spillway. The area upstream of the dam floods periodically and has abundant signs of beaver activity. There is a narrow strip of riparian willow and alder trees bordering the southern edge of the pond. The depth of water along the proposed guideway ranges from zero to several feet, depending on how the facility is managed at any given time. There is no salmonid spawning habitat in this reach. If fish have access, rearing habitat is good.

NE 16th Elevated (D2E) and NE 20th (D3) Alternatives Crossing

Alternatives D2E and D3 would cross the West Tributary to Kelsey Creek at a location downstream of the *Preferred Alternative* between the flood control dam and a concrete weir (Exhibit 3-11). The weir is about 3 feet high and causes the channel to pond in this reach. The weir is an impassable barrier to fish movement. The water in the pond is 2 to 3 feet deep with a bottom composition of silt and organic material. The riparian vegetation is composed of medium to large red alder and willow. The width of the riparian area is very narrow, with a building on one side and a commercial parking lot on the other. There is no salmonid spawning in this reach, but rearing habitat quality is good if fish have access to it. The West Tributary enters a culvert immediately downstream of the concrete weir and remains in a pipe system the remaining distance downstream to Bel-Red Road.

09/28/2009 12:44

EXHIBIT 3-11
West Tributary to Kelsey Creek at weir, which forms the southern end of Wetland WR-8SE

SR 520 Alternative (D5) Crossing

Alternative D5 would cross the West Tributary to Kelsey Creek in a narrow ponded reach with a riparian area that is tightly confined (i.e., 100 feet wide) between a bus parking lot and a Safeway bakery (Exhibit 3-12). The riparian area, while narrow, is forested with mature alder and willow. The channel is completely impounded by beaver dams throughout the entire reach, and during field reconnaissance, a beaver was observed swimming in a pond. The bottom of the West Tributary in this area could not be seen, so the depth is unknown but is at least 3 feet. The bottom is probably silt and organic material. There is no spawning habitat for salmonids. Rearing habitat is good, if salmonids have access to it.

EXHIBIT 3-12
West Tributary to Kelsey Creek (also Wetland WR-8NW) at the proposed crossing of Alternative D5

Goff Creek

The 680-acre Goff Creek drainage is small and narrow. Its headwaters are in Bridle Trails State Park. The stream flows south for about 1.4 miles, entering the West Tributary to Kelsey Creek just south of Bel-Red Road. The drainage is suburban/rural in the upper reach, residential in the middle reach, and commercial in the reach south of SR 520. The impervious surface area is 30 percent of the drainage area. The drainage overall has a slope of 2 percent.

Cutthroat trout are known to inhabit Goff Creek throughout its length. Sockeye and Chinook salmon use the lower reach for spawning. During the 2006 spawner survey, 12 live Chinook and 8 carcasses were observed in Goff Creek (City of Bellevue, 2007a). An impassable culvert at Bel-Red Road prevents fish access to upstream reaches.

Preferred NE 16th At-Grade Alternative D2A, NE 16th Elevated (D2E), and NE 20th (D3) Alternatives Crossing

Goff Creek is confined in a culvert for over 200 feet in either direction of the crossing centerline of *Preferred Alternative D2A* and Alternatives D2E and D3. The City of Bellevue lists this piped segment as impassable. Habitat for salmonids was rated as poor in this reach.

SR 520 Alternative (D5) Crossing

Alternative D5 crosses Goff Creek on the highway fill slope of SR 520 (Exhibit 3-13). The culvert under the crossing is perched with a 5-foot drop and is thus impassable to fish. The 200-foot reach upstream from the crossing is all in a culvert under SR 520. The reach downstream from the crossing is tightly confined between a parking lot and a commercial building. The stream is confined on each side with 4- to 6-foot-high rock walls because the streambed is set below the parking lot and building. There is no riparian vegetation other than planted ornamental ivy and a few low shrubs, but the channel receives afternoon shading from the building. Channel morphology is mostly riffle on fairly clean small gravel. Substrate conditions are suitable for trout spawning. There are only two pools in the survey reach. Overall spawning and rearing habitat quality was rated as fair during the survey.

EXHIBIT 3-13
Goff Creek downstream of SR 520

Unnamed Tributary to Kelsey Creek

The Unnamed Tributary to Kelsey Creek is very small (with a channel less than 4 feet wide) and sometimes intermittent. It is located between Goff Creek and Valley Creek and runs north-south parallel to them. This watercourse's base flow is greater than 0.05 cubic feet per second (cfs). The entire drainage lies within a commercial district. The creek exits a pipe system just south of NE 20th Street on the shoulder of 136th Place NE. The creek then flows south for about 500 feet, where it enters a piped system. It remains in that piped system most of the way to its confluence with Kelsey Creek at Bel-Red Road. With no spawning habitat and a fish passage blockage at the confluence with Kelsey Creek, the Unnamed Tributary cannot currently support salmonids.

Preferred NE 16th At-Grade Alternative D2A, NE 16th Elevated (D2E), and NE 20th (D3) Alternatives Crossing

In the vicinity of the *Preferred Alternative D2A* and Alternatives D2E and D3 crossings, this watercourse is a grass-lined ditch (Exhibit 3-14). There are no habitat features such as pools or riffles. The gradient is flat, and substrates consist of grass, silt, and sand. Riparian vegetation consists of mowed grasses. There are a few pools downstream of culvert outlets. The habitat components are 76 percent glide, 2 percent pool, and 22 percent culvert. The 849 feet surveyed represent the entire open channel in this stream system. Spawning habitat is absent and rearing habitat was rated as poor. As the creek flow crosses 136th Place, most but not all of the water is intercepted by a pipe system that conveys the water south to NE 16th Street, then east until it reconnects with the creek's natural channel.

09/22/2009 15:05

EXHIBIT 3-14
Unnamed Tributary to Kelsey Creek at 136th Place NE

Valley Creek

Valley Creek originates in Redmond just north of the Bellevue/Redmond city limits. The drainage area is 1,391 acres. The creek flows through commercial areas between SR 520 and Bel-Red Road. It flows in a southerly direction for 2.5 miles to enter Kelsey Creek at Bel-Red Road and 140th Avenue NE. The drainage is mostly built out, with single-family residences dominating the land use. The impervious surface area is approximately 32 percent of the drainage area. The drainage slope is gradual at 1.1 percent. Historical information shows sockeye, Chinook, and coho salmon present throughout the mainstem of Valley Creek as far upstream as the Bellevue Municipal Golf Course outfall culvert. Cutthroat and steelhead trout are assumed to be present throughout the drainage as well.

NE 20th Alternative (D3) Crossing

The Alternative D3 route crosses Valley Creek at NE 20th Street (Exhibit 3-15). The reach downstream of the crossing is riffle/run morphology with a few pools. The wetted width was about 6 to 10 feet at the time of survey in March 2007. Substrate character is mostly small gravel with excessive sand, thus making spawning conditions marginal to poor. Riparian vegetation is mature red alder and willow, starting at 20 feet wide and getting much wider in the downstream direction. Bank condition is good and overall spawning and rearing habitat quality is rated as good.

Preferred NE 16th At-Grade (D2A), NE 16th Elevated (D2E), and SR 520 (D5) Alternatives Crossing

These alternatives' routes cross Valley Creek over the SR 520 culvert. The reach downstream from SR 520 is confined between buildings and parking lots. The reach between SR 520 and NE 21st Street is a shallow, featureless glide with a sand/silt bottom. There are no pools, riffles, or LWD. The riparian community is mostly mowed grasses with building structure or asphalt within 10 to 20 feet of the channel. Part of the reach has a 10-foot-wide cluster of willow shrubs on the west side of the channel. Spawning and rearing habitat quality is poor in this reach.

09/21/2009 14:29

EXHIBIT 3-15
Valley Creek downstream of SR 520

The reach between NE 21st Street and NE 20th Street is a diverse mixture of habitat types (Exhibit 3-16). The stream has a meandering character, thereby forming a few good pools; at the pools, the banks are undercut. There is a riffle with clean gravel of a size suitable for salmon (Exhibit 3-17). The riparian community on the west side of the creek is almost entirely dominated by blackberries, with some small alder trees. The riparian community on the east side is mostly reed canary grass, with a few blackberry patches. A mayfly hatch occurred while the survey was being conducted. Mayflies are an indicator of good water quality conditions. Habitat in this reach is considered to be good.

EXHIBIT 3-16
Valley Creek downstream of NE 20th Street

Overall, the two reaches together have fairly good spawning and rearing habitat based on the in-stream characteristics. The pool/riffle ratio is 50/50, which is considered optimal. The habitat components are 35 percent pool, 31 percent riffle, 7 percent run, 15 percent glide, and 12 percent culvert.

Sears Creek

Sears Creek is a small, 577-acre drainage. Most of the drainage's surface water flows through a piped system, with only a small fraction in an open channel. Although the drainage is 1.5 miles long, the length of open channel is only about 1,100 feet. The impervious surface is 64 percent of the drainage area. The average slope in the drainage is 4.3 percent. Considerable use by Chinook salmon, coho salmon, and cutthroat trout occurs up to the NE 20th Street culvert.

09/21/2009 15:26

EXHIBIT 3-17
Valley Creek between NE 20th and NE 21st Streets

NE 20th Alternative (D3) Crossing

The Alternative D3 route would cross Sears Creek at NE 20th Street. The culvert under NE 20th is approximately 450 feet long. The outlet is about 150 feet downstream from the street and about 8 to 10 feet lower than the street. The City of Bellevue GIS database indicates that this culvert is a fish passage blockage. The stream in this reach is tightly confined between NE 21st Street and a parking lot for a strip mall; NE 21st Street is only about 15 feet from the channel and the parking lot is only 3 to 5 feet from the channel (Exhibit 3-18). The riparian area is composed of bare, bark-mulched ground and a few small, scattered alder trees and blackberry vines. The banks in this reach consist entirely of riprap. Despite these deficiencies, the reach was rated as fair spawning and rearing habitat quality because there are several pools formed intentionally with riprap boulders, and there are patches of clean gravel in short riffles. The channel is straight, but there is a fair amount of channel complexity.

EXHIBIT 3-18
Sears Creek downstream of NE 20th Street

3.1.2.5 Segment E

Exhibit 3-5 shows the streams and fish passage features in Segment E.

Sammamish River

The Sammamish River is 13.8 miles long, extending from the outlet of Lake Sammamish in Redmond to the inlet of Lake Washington in Kenmore. The subbasin drains 240 square miles, of which 97 are in the Lake Sammamish drainage, 50 in the Bear Creek drainage, and the balance in the Swamp Creek, North Creek, and Little Bear Creek drainages. The Sammamish River once looked very different from how it does today. Prior to Euro-American settlement, the Sammamish River was twice as long and had a complex, highly sinuous, meandering channel with abundant associated forested wetlands. Much of the lower river was backwater from Lake Washington. The area was logged from the 1870s through the early twentieth century. When Lake Washington was lowered by 10 feet in 1916, the overall gradient in the Sammamish River was increased accordingly, and many wetland areas were drained. As agriculture expanded in the Sammamish Valley, more wetlands were drained and turned into farmed fields. Farmers began to straighten the channel around 1911. In 1962, the USACE deepened and channelized the river to its present location.

At present, habitat in the Sammamish River is highly degraded. In the vicinity of the three potential river crossings, river character is essentially the same. Channel morphology is all glide habitat, which is one of the least desirable habitat types for salmonids. Glides make up 98.2 percent of the river’s length (R2 Resource Consultants, 1999). When the river was dredged, all of the LWD was removed, and the only LWD present today was installed in a few locations. When the land was cleared, the riparian trees were removed as well. The current riparian community is composed primarily of Himalayan blackberry vines and reed canarygrass, both of which are non-native and invasive. The trees are mostly young alder. This leaves the river exposed to sunlight, which causes high temperatures in the summer. The river is on Ecology’s 303(d) list for violation of state temperature and oxygen standards. Substrate consists of sand and silt, and it probably never contained much gravel due to the low gradient and position below Lake Sammamish.

The Sammamish River provides little rearing or spawning function for salmonids but serves as an important migratory corridor for tributaries. Holly Coccli, Muckleshoot Indian Tribe biologist, cites a personal communication with Jim Mattila as reporting that cutthroat trout spawn at the mouths of tributaries where there is gravel (Muckleshoot Indian Tribe, 2009). The river is known to seasonally contain Chinook salmon, coho salmon, sockeye salmon, and Kokanee salmon, steelhead, and cutthroat trout. Most of the sockeye are bound for Bear Creek and most of the Chinook are bound for the WDFW hatchery in Issaquah.

Preferred Marymoor Alternative (E2) Crossing

The *Preferred Alternative E2* route would cross the Sammamish River to the south and just upstream of the SR 520 bridge (Exhibit 3-19). Most of the habitat found in the vicinity of this

EXHIBIT 3-19
Sammamish River at SR 520

crossing is glide, which is typical for the entire Sammamish River. The exception to this is 200 feet upstream of the Bear Creek confluence, where there is a large pool. Substrates are uniformly sand and silt except directly under the SR 520 Bridge, where it is cobble and riprap. The banks under the bridge are also riprap. The riparian area is about 30 to 50 feet wide and mostly vegetated by blackberry vines and young alder trees. There are some young conifer plantings on the north side of the bridge. Overall spawning and rearing habitat conditions are poor. Some afternoon shade would be provided in the future when the young riparian trees grow taller.

Redmond Way Alternative (E1) Crossing
The Alternative E1 crossing is located on the upstream (south) side of the Redmond Way bridge (Exhibit 3-20). Habitat is all glide except for a short riffle on either side of a manmade gravel bar. The gravel bar is enhanced by two large rootwads. There are other log clusters on the banks as well, which has the appearance of a habitat enhancement project. The riparian area is a narrow band of mixed deciduous trees on the west bank of the river and a narrow band of blackberries or grasses on the east bank. Except for the gravel bar, bottom composition is sand and silt and overall spawning and rearing habitat quality is poor.

EXHIBIT 3-20
Sammamish River at Redmond Way

Leary Way Alternative (E4) Crossing
The Alternative E4 crossing is located to the south and upstream of the Leary Way bridge (Exhibit 3-21). As elsewhere in the Sammamish River, glide habitat is dominant in this reach. However, there is a short, manmade riffle composed of riprap on the north, downstream side of the existing bridge. Other than this artificial riffle, substrate is composed of sand and silt. The riparian area is narrow with asphalt trails on either side of the river and has only 40 to 50 feet of width on steep banks. The riparian vegetation is composed almost entirely of blackberry vines with a few scattered small alder trees. Just upstream from the bridge, there is a group of larger red alder trees on the south bank that provides some afternoon shade. Overall spawning and rearing habitat quality in this reach is poor.

EXHIBIT 3-21
Sammamish River at Leary Way

Bear Creek

The Bear Creek drainage drains about 50 square miles of suburban and rural land. The drainage has three subdrainages: Bear Creek, Cottage Lake Creek, and Evans Creek. Throughout the drainage, there are more than 100 miles of streams, 9 lakes, and over 2,000 acres of wetlands. Urban development is spreading throughout the drainage, with an associated shift from forest to impervious surfaces and landscaped areas; however, Bear Creek remains one of the most productive systems in the region. The diversity and number of aquatic resources in the Bear Creek drainage distinguished it as one of the top six natural resource areas in King County in the Waterways 2000 Program (Kerwin, 2001).

The Bear Creek drainage is known to support Chinook salmon, coho salmon, sockeye salmon, Kokanee salmon, steelhead, and cutthroat trout. The drainage also might support bull trout, although none have been found to date. Spawner counts have not been made in the drainage, but WDFW operates a smolt trap at the location of the potential rail crossing under the East Link Project Segment E alternatives. In 1999, the estimated number of smolt or fry outmigrants was 14,525 Chinook smolts, 1,772 steelhead smolts, 3,413 cutthroat smolts, and 1,514,669 sockeye fry; the count for coho in 1997 was 64,102 smolts (Seiler, 2000).

Preferred Marymoor Alternative (E2), Redmond Way (E1), and Leary Way (E4) Alternatives Crossing

The crossing of Bear Creek by *Preferred Alternative E2* and Alternatives E1 and E4 is at the same location as the existing abandoned former BNSF Railway timber bridge (Exhibit 3-22). Habitat in the vicinity is a mixture of pools and runs. Substrates are gravel and cobble. This is a known sockeye spawning area. Blackberry vines dominate the riparian area upstream of the bridge. Downstream from the crossing, riparian vegetation on the north bank is medium-sized mixed conifer and deciduous trees. On the south bank, vegetation is patchy mixed conifer and deciduous trees and grassy areas planted with willow and conifer trees. This area serves as an overflow channel/wetland area. It was built in association with a major channel relocation/habitat enhancement project downstream of the crossing. There are more than 100 logs with rootwads embedded in the banks of the meandering channel. Beaver activity is apparent, and the willow plantings are suffering from it. Habitat values of the riparian community will be good when the plantings mature. Overall spawning and rearing habitat quality in this reach is good.

EXHIBIT 3-22
Bear Creek at former BNSF Railway crossing

3.1.3 Tribal Fishing

There are no non-tribal commercial fisheries in the study area, but there are tribal fisheries, most of which are commercial in nature. Sound Transit consulted with the Muckleshoot Indian Tribe about Usual and Accustomed Treaty Rights that provide Tribes with unique fishing, hunting, and gathering rights. The Tribe expressed concern about the effects of the project on their fisheries (Walter, 2008). Their fisheries are set (species, harvest numbers, and dates) through consultation with the Pacific Salmon Fisheries Commission and can span between July and December. The Tribe asked to be notified if and when in-water work was planned in Lake Washington.

3.1.4 Federal and State Threatened, Endangered, and Candidate Species

Table 3-4 lists the federal- and state-threatened, endangered, and candidate aquatic species known to occur in the study area. The following subsections describe the distribution of these species.

TABLE 3-4
Federal and State Threatened, Endangered, and Candidate Aquatic Species Known to Occur in the Study Area

Species	Federal Status	State Status
Puget Sound Chinook salmon	Threatened	Candidate
Puget Sound steelhead	Threatened	None
Coastal-Puget Sound bull trout	Threatened	Candidate
River lamprey	Species of concern	Candidate
Western toad	Species of concern	Candidate

3.1.4.1 Puget Sound Chinook Salmon

Chinook salmon are present in a number of the larger streams in the study area. Their known distribution in the project vicinity is as follows:

- Lake Washington
- Mercer Slough
- Kelsey Creek: At outlet, in Mercer Slough, and upstream of study area
- Sturtevant Creek up to the I-405 culvert

- West Tributary to Kelsey Creek: Up to Goff Creek
- Goff Creek: Up to Bel-Red Road
- Valley Creek: Up to the Bellevue Golf Course (above SR 520)
- Sears Creek: Up to NE 20th Street
- Sammamish River
- Bear Creek: In and north of the study area

3.1.4.2 Puget Sound Steelhead

Steelhead are present in low numbers throughout the Lake Washington basin in the larger tributaries. Their known distribution within the study area is as follows:

- Lake Washington
- Mercer Slough
- Kelsey Creek: Currently not known to be present in the entire drainage; however, their presence historically is probable and assumed for purposes of ESA consultation
- Sammamish River: Throughout the study area and upstream
- Bear Creek: In and upstream from the study area

3.1.4.3 Coastal-Puget Sound Bull Trout

Bull trout are only known to use Lake Washington and possibly tributaries as seasonal rearing areas. Spawning and early rearing areas have not been found to date. Such areas may be present, however, in upper tributaries to the Cedar River and possibly coldwater tributaries to Bear Creek.

3.1.4.4 River Lamprey

Although there are no direct observations of river lampreys in the study area, their presence is likely. They are known to exist in tributaries to Lake Washington and Lake Sammamish such as the Cedar River and Issaquah Creek.

3.1.4.5 Western Toad

Western toads (*Bufo boreas*) use three different types of habitat: breeding habitats, terrestrial summer range habitat, and winter hibernation sites. Their preferred breeding sites are permanent or temporary water bodies that have shallow sandy bottoms. After breeding, adult western toads disperse into terrestrial habitats such as forests and grasslands. They may roam far from standing water, but they prefer damp conditions. Western toads spend much of their time underground; although they are capable of digging their own burrows in loose soils, they generally shelter in small mammal burrows, beneath logs, and within rock crevices. They hibernate in burrows below the frost line, up to 3.6 feet underground. The PHS database for the study area did not have sighting evidence for the western toad. However, they are known to exist in the region and may be present in small numbers within the study area. Suitable habitats may exist in Mercer Slough; along larger, low-gradient rivers and streams; and in adjacent undeveloped uplands.

3.1.5 WDFW Priority Habitats and Species

The list of WDFW priority species and habitats shown in Table 3-5 was obtained from the WDFW PHS database. The list was reduced to species documented or believed to be present in water bodies in the study area. Reports of green sturgeon *(Acipenser medirostris)* in Lake Washington are old. Channel catfish *(Ictalurus punctatus)* are rare and non-native. Only a few bull trout have been documented in Lake Washington, and they were observed entering the lake through the fish ladder at the locks.

TABLE 3-5

Unk – Possible presence of species, but verification is unknown.

3.2 Vegetation and Wildlife Resources

The urban nature of the project vicinity negatively affects species diversity, thus favoring species that can use altered environments and are more tolerant of human activity. However, the project vicinity also includes a few areas with large, established habitats that support an array of wildlife species, more than are typically found in highly urbanized areas.

The investigation identified nine vegetation types, including wetlands and open water, within the East Link study area, using color aerial photographs and field verification. Table 3-6 provides descriptions of these vegetation types and examples of where they occur within the study area. Exhibits 3-23 to 3-26 show the mapped vegetation types.

TABLE 3-6
Vegetation Types Identified in East Link Vegetation and Wildlife Study Area

Vegetation Type	Habitat Value	Examples of Occurrence	Description
Riparian forest	High	South end of Mercer Slough Nature Park	Vegetated banks along river edges. Often dominated by willow and red alder. Large big-leaf maple, black cottonwood, and red alder trees may occur. Non-native shrubs (Himalayan blackberry and Scot's broom), grasses, thistles, and other weeds are common. Areas dominated by blackberry were classified separately from riparian forest because of the much lower habitat value of blackberry-dominated areas.
Urban mostly vegetated – Coniferous forest	High	West side of Bellevue Way	Forest patches generally dominated by Douglas-fir with lesser amounts of black cottonwood, big-leaf maple, red alder in the overstory, and occasionally shore pine and red cedar. Canopy cover variable but generally greater than 40 percent. Douglas-fir trees mostly taller than 50 feet. Shrub layer often dominated by Himalayan blackberry but also includes salmonberry, snowberry, salal, Indian plum, rhododendron, and other shrubs. Herb layer, when present, includes grasses, sword fern, fringe cup, and nettles.
Urban mostly vegetated – Deciduous forest	High	East side of Bellevue Way	Forest patches with black cottonwood, big-leaf maple, red alder (40 to 70 feet tall) and few conifers in the overstory. Canopy cover 40 to 80 percent. Understory tree cover may include big-leaf maple, black cottonwood, red alder, and Pacific madrone. Shrubs similar to those of coniferous forest type.
Urban mostly vegetated – Mixed forest (deciduous/coniferous)	High	East side of the BNSF Railway	A few small areas with a roughly even mix of deciduous trees and conifers in the overstory.
Urban moderately vegetated	Moderate	Areas of parks that have been planted with trees and shrubs, as in Marymoor Park	Dominated by open mowed lawns. Large native and ornamental trees (generally 40 to 70 feet tall) also present. Some patches of ornamental and native shrubs may occur. Tree and shrub canopy cover values generally less than 30 percent.
Urban sparsely vegetated	Low	Landscaping along highways	Commercial and industrial properties, road rights-of-way, and neighborhoods with a few or small patches of ornamental and native trees and considerable human activities.
Blackberry	Low	Along roads and highways	Areas dominated by blackberry with little or no tree canopy.
Open water	High	Lake Washington	Highly variable community including saline and fresh waters, deep or shallow waters, rivers, creeks, and large water bodies.

- The relative function of each vegetation type in providing habitat for wildlife are described based on reconnaissance-level field observations, literature review (including *Wildlife-Habitat Relationships in Oregon and Washington* [Johnson and O'Neil, 2001]), professional opinion, and agency consultation. The following habitats provide high-value habitat:
- Urban mostly vegetated – coniferous forest
- Urban mostly vegetated – deciduous forest
- Urban mostly vegetated – mixed forest (deciduous/coniferous)
- Riparian forest

3.2.1 Beneficial Habitats

Wildlife use of urban habitats depends on the general location of the habitat, the size and type of undisturbed habitats, the degree of connectivity and extent of travel corridors between and among these habitats, and the types and levels of human activity. Much of the East Link Project would occur in commercial, industrial, and residential areas that provide habitat only for adaptable species such as sparrows, finches, doves, rats, mice, raccoons, opossums, and squirrels. Larger habitat patches and those connected to other natural areas or heavily vegetated residential neighborhoods support a larger variety of species, including several species of songbirds, black-tailed deer, and raptors such as American kestrel *(Falco sparverius)*, red-tailed hawk *(Buteo jamaicensis)*, and great horned owl *(Bubo virginianus)*. Species such as the American robin *(Turdus migratorius)*, song sparrow *(Melospiza melodia)*, Steller's jay *(Cyanocitta stelleri)*, American crow *(Corvus brachyrhynchos)*, spotted towhee *(Pipilo maculates)*, black-capped chickadee *(Poecile atricapillus)*, white-crowned sparrow *(Zonotrichia leucophrys)*, northern flicker *(Colaptes auratus)*, Bewick's wren *(Thryomanes bewickii)*, and red and white breasted nuthatches *(Sitta spp.)* are also fairly common. Streams and larger water bodies provide habitat for many waterfowl species, including Canada goose *(Branta canadensis)*, belted kingfisher *(Megaceryle alcyon)*, red-breasted merganser *(Mergus serrator)*, common merganser *(M. merganser)*, western grebe *(Aechmophorus occidentalis)*, double-crested cormorant *(Phalacrocorax auritus)*, mallard *(Anas platyrhynchos)*, lesser scaup *(Aythya affinis)*, American coot *(Fulica Americana)*, as well as many of the species associated with wetlands.

There are several large areas of native habitat in East Link Project study area, the largest of which is Mercer Slough Nature Park. However, this park is surrounded on all sides by residential and commercial developments, roads, and highways, which limits its value for wildlife species that require large undisturbed areas and undeveloped travel corridors.

Patches of deciduous, coniferous, and mixed forests occur in Segments B, D, and E. Most of these areas are fragmented and separated from surrounding habitat areas by commercial, urban, and residential developments and roads. Despite their isolation, these areas still provide habitat for forest-associated resident and migratory songbirds, as well as for hawks, owls, great blue herons *(Ardea herodias)*, woodpeckers, reptiles, and small mammals. These areas include the Mercer Slough I-90 wetland (WR-4) in Segment B, the forested area located in the southern portion of the BNSF Matrix wetland (WR-6) in Segment D, the Redmond Center forest in Segment E, and small forested patches along SE Leary Way and West Sammamish Parkway in Segment E. These habitat areas are described below and shown in Exhibits 3-23 to 3-26 and Exhibits 3-1 to 3-5 in Section 3.1. Many of these sites are recognized as WDFW priority habitats. There is no beneficial habitat in Segment C; therefore, it is not discussed in the following sections.

3.2.1.1 Segment A

Lake Washington supports a wide variety of aquatic and semi-aquatic fish and wildlife species. More than 15 species of waterfowl use the lake at different times of the year. It is also used by foraging bald eagles, osprey, peregrine falcons *(Falco peregrinus)*, and great blue herons, among many other species.

3.2.1.2 Segment B

Mercer Slough Nature Park in Segment B is the largest freshwater wetland remaining along the shores of Lake Washington. The park encompasses 320 acres and is composed of herbaceous, scrub-shrub, and forested wetlands; upland forests; meadows; and a blueberry farm. More than 170 bird species are listed as breeding, foraging, or migrating through the park. Amphibians, reptiles, and a number of small mammal species, including red-winged blackbird *(Agelaius phoeniceus)*, yellow-rumped warbler *(Dendroica coronata)*, common yellowthroat *(Geothlypis trichas)*, violet-green swallow *(Tachycineta thalassina)*, cliff swallow *(Petrochelidon pyrrhonota)*, barn swallow *(Hirundo rustica)*, Anna's hummingbird *(Calypte anna)*, and several species of wading birds, in addition to several bat species, are also found within the park's boundaries. Red-tailed hawks and great blue herons are also regularly seen in this area.

3.2.1.3 Segment D

Wetlands with some ponding water and riparian areas with small-stemmed emergent vegetation provide habitat for amphibians. In Segment D, these areas include West Tributary to Kelsey Creek Ponded (WR-7), West Tributary to Kelsey Creek Riparian (WR-8NW, WR-8N, and WR-8SE), East of 140th Avenue NE (WR-10W), West of 140th NE (WR-11), and BNSF Matrix (WR-6) wetlands (see Exhibit 3-28 in Section 3.3, Wetlands).

The West Tributary to Kelsey Creek runs through the study area, eventually flowing into Kelsey Creek. The Creek is surrounded by commercial and urban development for most of its length. A flood control dam next to the Metro bus maintenance facility off of 124th Avenue NE creates a large ponded area before the creek exits the other side of the road. An active beaver dam is located just upstream from the dam in a forested riparian corridor, dominated by deciduous trees. The habitat just downstream from the water control device is a mixed emergent, scrub-shrub, and riparian area. This area supports breeding and migratory songbirds and waterfowl and likely supports amphibians and small mammals.

Exhibit 3-26
Vegetation and Wildlife Habitat
Segment E
East Link Project

3.2.1.4 Segment E

In Segment E, the Sammamish River (also known as Sammamish Slough) is bordered by a mowed grass park with widely planted ornamental trees to the east and by roads and residential and commercial development to the west. The riparian corridor south of the NE Redmond Way Bridge is dominated by Himalayan blackberry from the top of the bank down to the water's edge. Although the bank offers little habitat for wildlife, the watercourse is still used by a variety of waterfowl. Canada geese, mallards, great blue herons, and double-crested cormorants were observed in the slough during visits in May 2007. Signs of beaver activity were also observed along the slough near the NE Redmond Way Bridge. South of the SR 520 bridge, a red-breasted merganser, common merganser, belted kingfisher, and lesser scaup were observed during site visits in mid-April 2007. In addition, approximately 36 double-crested cormorants use two cottonwood trees behind SE Leary Way as a winter roost. The roost is located just above the western bank of the Sammamish River.

There is a small coniferous forested area located adjacent to SE Leary Way and the Sammamish River. The Redmond Center heronry was located in this forested section until its abandonment in 2004 due to bald eagle harassment and the increase in development immediately adjacent to the forest stand. The forest is dominated by Douglas-fir trees and has an understory of Indian plum and Himalayan blackberry. Since 2004, portions of the forested stand have been cleared for road improvements and building construction. Continuing development adjacent to the forested stand, coupled with the continued presence of bald eagles in the area, have discouraged the birds from returning.

Beaver and other small mammals, as well as woodpeckers, forest- and wetland-associated songbirds, common waterfowl, hawks, and owls occur along Bear creek and its associated riparian habitats. Special-status avian species observed at Bear Creek include great blue heron, osprey, and bald eagle. One or more bat species may forage in and around the creek and riparian area. A restoration project along the banks of Bear Creek exists downstream from the proposed light rail crossing of the creek. Non-native vegetation has been removed and replanted with native shrubs and tree saplings.

Marymoor Park was once part of the floodplain of Lake Sammamish. Currently, the Sammamish River runs through a portion of the park and enters Lake Sammamish at the southern boundary of the park. Marymoor Park is 640 acres and has a variety of habitats, including herbaceous, scrub-shrub and forested wetlands, riparian corridors, deciduous upland forests, and grassy fields. Two bald eagle nests, an osprey nest, and a red-tailed hawk nest are located within the park's boundaries. Three pairs of red-tailed hawks were observed at several locations at Marymoor Park during the vegetation surveys conducted in April 2007. Several nest boxes are set up for purple martins at the south end of the park, and they have used these nest boxes in the past. However, since 2008, use of these boxes by purple martins is uncertain (Hobbs, 2011). More than 195 bird species have been recorded, primarily breeding and migratory songbirds and waterfowl. Reptiles and a variety of small mammals and deer also occur in the park. Although habitat exists within the park boundaries for several bat species, none are listed as occurring at Marymoor Park and no formal bat surveys have been conducted. Salmon migrate up the Sammamish River destined for spawning areas upstream. During the salmon spawning runs, groups of juvenile bald eagles congregate in Marymoor Park along the Lake Sammamish shoreline. Approximately 31 juvenile bald eagles were counted one evening in September 2006. A small mitigation wetland is located on the northern end of the park, abutting the park's boundary with SR 520.

3.2.2 WDFW Priority Habitats and Vegetation Types

Table 3-7 lists the types of WDFW-designated priority habitats that occur in the East Link Project study area and the location of key habitats.

TABLE 3-7
WDFW Priority Habitats That Occur in East Link Project Study Area

WDFW Priority Habitat Type	WDFW Criteria for Designation as a Priority Habitat Type	Corresponding Project Vegetation Types and Locations[a]
Freshwater Wetlands and Fresh Deepwater	Comparatively high fish and wildlife density, high fish and wildlife species diversity, important fish and wildlife breeding habitat, important fish and wildlife seasonal ranges, limited availability, high vulnerability to habitat alteration	Wetland and open water, including Lake Washington (*Preferred A1*) and much of Mercer Slough Nature Park (*Preferred B2M*, B1, B2A, B2E, B3, B7)
In-stream	Comparatively high fish and wildlife density and species diversity, important fish and wildlife seasonal ranges, limited availability, high vulnerability to habitat alteration, dependent species	Kelsey Creek, West Tributary to Kelsey Creek, Valley Creek (*Preferred D2A*, D2E, D3, D5) Goff Creek (D5) Bear Creek and Sammamish River (*Preferred E2*, E1, E4)
Riparian	High fish and wildlife density, high fish and wildlife species diversity, important fish and wildlife breeding habitat, important wildlife seasonal ranges, important fish and wildlife movement corridors, high vulnerability to habitat alteration, unique or dependent species	Riparian areas along: Mercer Slough (B7) West Tributary to Kelsey Creek (*Preferred D2A*, D2E, D3, D5) Bear Creek *(Preferred E2*, E1, E4)
Biodiversity Areas and Corridors	Areas of habitat that are relatively important to various species of native fish and wildlife.	Urban mostly vegetated – coniferous forest and deciduous forest (*Preferred B2M*, B1, B2A, B2E, B3, B7)

3.2.3 Federal and State Threatened, Endangered, and Candidate Species and Species of Concern

Other than the aquatic species discussed in Section 3.1 of this report, there is one ESA-listed species (marbled murrelet *[Brachyramphus marmoratus]*), which is listed but not likely present, and four federal candidate or species of concern that are likely to be present in the study area. These species are described herein. Other state-priority species known or likely to be present in the study are identified in Table 3-8. Appendix C lists the ESA-listed and state-priority species that are known in the study area and that are likely present and possibly present within the project vicinity based on the known or general distribution of the species, their habitat preferences, and the presence of potentially suitable habitat for the species. This report does not discuss wildlife species “possibly present” other than by way of addressing the high-value habitats that may be suitable habitat for these species.

Site-specific distribution data are available for only a few of these species, and no species-specific surveys or habitat assessments were conducted for this project. The USWFS Threatened and Endangered Species System website for species and habitats listed in King County indicated that there is a federally threatened wildlife species under the ESA: the marbled murrelet. ESA-listed fisheries resources that may potentially occur within the study area were addressed in Section 3.1, Aquatic Resources, of this report. Database searches indicated that there are no federal-listed nor state-listed plants in the study area. Based on the available known and general distribution data, habitat requirements, and habitats present in the vicinity of the study area, no priority terrestrial small mammal, large mammal, reptile, or insect species other than butterflies occur or are likely to occur within a half mile of any of the project segments.

TABLE 3-8
State Priority Species Likely or Known to Occur in East Link Project Study Area

Name	State Status[a]	Presence, Preferred Habitat, and Probable Location in Study Area
Bird		
Pileated woodpecker (*Dryocopus pileatus*)	State candidate	Known in the study area. Typically found in forests with a component of dead and dying trees and snags for foraging and nesting. Found at Marymoor Park and throughout the study area. One bird observed near I-405 south of SE 8th Street. Likely habitat along the BNSF (B7) and *Preferred Marymoor (E2)* alternatives due to larger clusters of larger trees and snags.
Purple martin (*Progne subis*)	State species of concern	Known in the study area. Nests in structures over water bodies, including natural cavities, pilings, and manmade housing structures. Forages over open water or wet areas for insects while in flight. Nesting observed at Marymoor Park in 2003 (*Preferred Alternative E2*). Habitat may also be present in Segment B.
Western grebe (*Aechmophorus occidentalis*)	State species of concern	Known in the study area. Nests in colonies numbering up to several hundred birds east of the Cascade Mountains and is a winter resident on Lake Washington and Puget Sound The highest likelihood of occurrence is in Segment A.
Merlin (*Falco columbarius*)	State species of concern	Likely present in the study area. Seen during the nesting season at Marymoor Park. Commonly found throughout western Washington, including urban areas, in winter and during migration. Might occur in Segments A, B, D, and E.

[a] Washington priority species include only native Washington fish and wildlife species that are listed as endangered, threatened, or sensitive, or as candidates for these designations as established in the Washington Administrative Code.

3.2.3.1 Marbled Murrelet

The marbled murrelet is listed as a federal and state threatened species and might occur in Segment A. The population is rapidly declining, and the USFWS has determined that the population is currently not self-sustaining (Csuti et al., 1991; Ralph et al., 1995; Wahl et al., 2005). During the nonbreeding season, marbled murrelets are rare and infrequent visitors to Lake Washington that have been observed on the lake in the past but have not been documented to use the lake since the early 1990s and only once in the last 50 years. As such, they are not expected to be in the project vicinity.

3.2.3.2 Bald Eagle

Bald eagles were listed as threatened under the ESA until July 2007, when they were delisted because the successful recovery efforts. However, bald eagles are still protected by two other federal laws: the Bald and Golden Eagle Protection Act and the MBTA. Both laws prohibit killing, selling, or otherwise harming eagles, their nests, or eggs. On June 5, 2007, the USFWS clarified its regulations implementing the Bald and Golden Eagle Protection Act and published a set of National Bald Eagle Management Guidelines. These actions are designed to give landowners and others clear guidance that actions they take on their property are consistent with the Bald and Golden Eagle Protection Act and the MBTA. The Bald Eagle Protection Act requires the establishment of rules defining buffers around bald eagle nest and roost sites. If the activity is within a half mile of an eagle nest or within a quarter mile of an eagle roost, WDFW is notified and works with the landowner to develop a Bald Eagle Management Plan (see WAC 232-12-292, Section 4.4).

There are no communal bald eagle roosts, winter concentration areas, or buffers for such areas within a half mile of any of the proposed alternatives or project elements. However, there are five active eagle territories located within a half mile of one or more of the alternatives (eagle territories vary in size depending upon the amount of food available and the density of eagles in the area). Three of the territories were known to be active with incubating adults in April 2007. The other two territories were active in 2006, but their status for 2007 is unknown. Bald eagles have strong site fidelity, so it is likely the birds are still within their territories and may have built new nests nearby. Therefore, all five nesting territories were included in this analysis. Table 3-9 presents the location of bald eagle nests in relation to the project alternatives and the results of the VIEWSHED analysis.

Four bald eagle nests are located either on the shoreline of Lake Washington or near the lake. Bald eagles are sighted in Segments A, B, and E. WDFW and the bald eagle recovery plan designated 800-foot-wide buffers around nests and shoreline foraging areas (see Appendix D for detailed WDFW management recommendations). The USFWS also designated larger territories around bald eagle nests and foraging areas. The buffers and territorial designations include relatively large areas of Lake Washington shoreline. None of the alternatives is located within any of the 800-foot-wide nest or shoreline buffers. *Preferred Interstate 90 Alternative (A1)* and Bellevue Way (B1), 112th SE At-Grade (B2A), 112th SE Elevated (B2E), 112th SE Bypass (B3), and BNSF (B7) Alternatives are within the larger territories of three nests.

TABLE 3-9
Location of Bald Eagle Nests in Relation to Project Alternatives, Visibility from Nests, and Distance from Nest to Alternative

WDFW PHS Bald Eagle Nest Number	Segments Within Half Mile of Nest	Shortest Distance, Nest to Segment (miles)	Segments Likely Visible from Nest	Minimum Distance to Visible Part of Segment (miles)	Area Visible from Nest
4712252059	*Preferred A1*, I-90	0.4	*Preferred A1*, I-90	0.4	Short sections of Mercer Island
4712252952	*Preferred A1*, I-90	0.6	*Preferred A1*, I-90	0.6	Short sections of Mercer Island
4712252056	*Preferred A1*, I-90 B1, Bellevue Way	0.5	*Preferred A1*, I-90	0.5	Much of Mercer Island
4712252017	B1, Bellevue Way	0.5	None	> 1	Much of Mercer Island and east quarter of Lake Washington
4712261026	E1, Redmond Way E4, Leary Way	0.5	None	> 1	None

There is an additional bald eagle nest located just over a half mile from SR 520 and *Preferred Marymoor Alternative (E2)*. This nest is very hard to see because it is hidden in a fork in a large maple or cottonwood tree in a densely forested area of Marymoor Park. Neither the highway nor *Preferred Alternative E2* would be visible from this nest site because of its location below the top of the forest canopy and the dense surrounding forest.

As many as 33 bald eagles, all but 2 of them juveniles, and several herons have been reported foraging along the shore of Lake Sammamish during the fall period (Norman, 2007b). The shortest distance between the study area and Lake Sammamish is about 0.75 mile, and there is no direct line of sight between the lake and the study area. Bald eagles are suspected of foraging for salmon along Bear Creek during the fall and winter.

3.2.3.3 Peregrine Falcon

Peregrine falcons are a federal-species of concern and state-monitored species. The WDFW PHS database indicates that there are three peregrine falcon nests within a half mile of the study area. One is located under the I-90 bridge across Lake Washington just above the Seattle shoreline, and the second is located under the East Channel bridge on the Mercer Island side. This nest was confirmed in 2006 and 2009 by WDFW (WDFW, 2010). Recent nesting activity is unknown. A third nest is located in Downtown Bellevue (WDFW, 2010). Sightings and potential viable habitat occur in Segments A, B, and E.

3.2.3.4 Olive-Sided Flycatcher

The olive-sided flycatcher (*Contopus borealis*) is a federal species of concern. It nests in coniferous forest and mixed coniferous-deciduous forests and woodland, often with service berry and mountain-mahogany. They also are attracted to burned-over areas with standing dead trees. Most nesting sites contain dead standing trees, which are used as singing and feeding perches. The cause of precipitous declines in their populations across known distributions is not fully understood. The small brood size, climate changes, deforestation in wintering areas, and declines in insect populations might all play a role in olive-sided flycatcher decline. It breeds in coniferous forests in North America. The olive-sided flycatcher is common in most forest openings throughout Washington and is sometimes found in city parks or suburban areas, especially during migration. This species might have potential habitat in Segments B and E.

3.2.3.5 Willow Flycatcher

Willow flycatchers *(Empidonax traillii)* are a federal species of concern. Willow flycatchers are strongly tied to brushy areas of willow, alder, and similar dense stands of riparian shrubs, especially where such riparian areas are bordered by open stands of cottonwood. They prefer thickets, open second growth with brush, swamps, wetlands, stream sides, and open woodlands. Water and deciduous shrubs appear to be their essential habitat elements for nesting areas. This species is declining because of several factors, including loss of riparian vegetation cover from recreational uses and grazing pressure, and heavy nest parasitism by cowbirds. Water diversions and flood control that prevent willow and alder regeneration and deforestation on wintering grounds are also likely factors in their long-term population instability. The willow flycatcher breeds in deciduous thickets, especially in willow thickets. Nest sites are often close to water. They are known to be present in Segments B and E.

3.2.4 Critical Area Ordinances

Title 21A of the GMA requires counties and cities in Washington to designate and protect critical areas, in accordance with RCW 36.70A.170. The GMA requires local jurisdictions to designate and protect critical areas using the best available science in developing policies and regulations to protect critical area functions and values. The GMA is intended to protect the public's health and safety by requiring county and city governments to create locally based plans and regulations that are centered on land use and natural resource issues as guided by the state legislature. Critical areas are one of the two primary natural resource areas addressed in the GMA planning process. Critical areas include wetlands, critical recharge areas for potable water aquifers, frequently flooded areas, geological hazard areas, and fish and wildlife habitat conservation areas.

Fish and wildlife habitat conservation areas are the primary way the WDFW works to conserve wildlife habitat in Washington. While WDFW is charged with protecting and maintaining fish and wildlife populations, WDFW has little authority over the habitats used by fish and wildlife species. Protection is primarily achieved through the voluntary actions of landowners and through existing state regulations, including SEPA, the GMA, the Forest Practices Act, and the SMA. WDFW primarily serves an advisory role by reviewing proposals for development and offering guidelines for species management on private property. WDFW has written management guidelines for all state- and priority-listed species. Priority species include species and wildlife congregations that are priorities for conservation due to their population status, sensitivity to disturbance, and economic, recreational, or tribal importance. These species may or may not be listed as an endangered, threatened, sensitive, or candidate species by the state or federal government. The management recommendations are generalized guidelines and are not enforceable regulations, except through CAOs enforced by local jurisdictions.

In order to meet the requirements established by the GMA, King County and the Cities of Bellevue, Mercer Island, and Redmond created CAOs to ensure the management and protection of lands used by listed and locally important species. The details of these ordinances and management recommendations are available in Appendix E.

The following paragraphs summarize applicable ordinances within the study area:

- Section 198 of the King County Comprehensive Plan requires the county to protect the active breeding sites of these species, as well as the immediate area surrounding each site to prevent any disturbance to breeding activities. The species include the bald eagle, great blue heron, osprey, peregrine falcon, northern spotted owl (*Strix occidentalis*), marbled murrelet, Townsend's big eared bat (*Corynorhinus townsendii)*, Vaux's swift, red-tailed hawk, and goshawk (*Accipiter gentilis*).
- The City of Mercer Island Comprehensive Land Use Plan includes Ordinance No. 05C-12, which details its critical areas regulations. In order to streamline its critical areas regulations, the City of Mercer Island adopted WDFW's PHS program in its entirety in 1998.
- Under Bellevue's Land Use Code 20.25H.025, any habitat associated with a species of local importance is to be designated a critical area. Furthermore, if a habitat associated with a species of local importance is impacted by a proposed development, the proposal shall implement the WDFW wildlife management recommendations designed for that species. If the habitat does not include a critical area or critical area buffer, but is occupied by a locally important species, then only the guidelines in the wildlife management recommendations need to be followed. Species of local importance include great blue heron, red-tailed hawk, bald eagle, peregrine falcon, osprey, pileated woodpecker, purple martin, common loon (*Gavia immer*), western grebe, merlin, great egret, green heron, Vaux's swift, Townsend's big-eared bat, and western toad.
- The City of Redmond's Critical Areas Ordinance (Ordinance #2259) applies species protection to state species of concern, Priority species designated by WDFW, and locally important species. The only locally important species is the great blue heron.

3.3 Wetland Resources

The 17 wetlands identified in the study area are discussed in Section 3.3.2. No wetlands were found in Segment A, so this segment is not included in exhibits or discussions of wetlands. Exhibits 3-27 through 3-29 illustrate the wetlands found in the study area. Most of these wetlands are associated with Mercer Slough, Sturtevant Creek, the West Tributary to Kelsey Creek, or Bear Creek. In addition to these larger systems, several smaller wetlands were found in the study area in the vicinity of Valley Creek and near the former BNSF Railway corridor in the Bel-Red corridor. All wetlands in the study area have been altered and are surrounded by urban and residential environments.

3.3.1 Analysis of Wetland Determinations

3.3.1.1 Soils

The Natural Resources Conservation Service (NRCS) soil survey map for King County lists 20 soil series in the study area (Table 3-10). Of these 20 series, six are classified as hydric soils: Bellingham silt loam, Norma sandy loam, Puget silty clay Loam, Seattle muck, Snohomish silt loam, and Tukwila muck (USDA SCS, 1988).

TABLE 3-10
Soil Series Found within East Link Project Study Area

Soil ID	Soil Name and Description	Soil Location	Hydric?
AgC	Alderwood gravelly sandy loam 6 – 15% slope	Steep slope west of West Sammamish Parkway	No
AgD	Alderwood gravelly sandy loam 15 – 30% slope	118th Avenue SE	No
AmC	Arents, Alderwood material 6 – 15% slope	Bus parking lot	No
Bh	Bellingham Silt Loam	Between 152nd Avenue NE and 156th Avenue NE in Overlake	Yes
Ea	Earlmont silt loam	Along Bear Creek Parkway	No
EvB	Everett gravelly sandy loam 0 – 15% slope	Redmond	No
EwC	Everett-Alderwood gravelly sandy loams 6 – 15% slope	West of Bellevue Way	No
InA	Indianola loamy fine sand 0 – 4% slope	Along 520 in Redmond	No
KpB	Kitsap silt loam 0 – 8% slope	118th Avenue SE	No
KpC	Kitsap silt loam 8 – 15% slope	118th Avenue SE	No
KpD	Kitsap silt loam 15 – 30% slope	118th Avenue SE	No
No	Norma sandy loam	Downtown Bellevue	Yes
Ur	Urban land	Bellevue, Overlake, Redmond	No
Pc	Pilchuck loamy fine sand	On the upper banks of the Sammamish River	No
Pu	Puget silty clay loam	Bellevue, Redmond	Yes
Re	Renton silt loam	Segment C west of Lake Bellevue	No
Sk	Seattle muck	West Tributary to Kelsey Creek Riparian area, Mercer Slough	Yes
So	Snohomish silt loam	Southwest Mercer Slough	Yes
Su	Renton silt loam	By the horseshoe-shaped detention pond	No

Exhibit 3-29
Wetland Resources
Segment E
East Link Project

All the hydric soils listed in Table 3-10 have a seasonal water table that reaches above or just below the surface. Runoff is slow for these soils, and available water capacity is high. In addition, the hazard of stream overflow is severe. Soil descriptions can be found at the King County Conservation District website (http://www.kingcd.org/pub_soil_des.htm) and the USDA website that is the source for Table 3-10.

3.3.1.2 Vegetation

Invasive non-native and opportunistic native plant species dominate the wetlands within the study area. These species tolerate many disturbances and can out-compete less tolerant native species and thus dominate a wetland. This cycle lowers wetland diversity, habitat complexity, and the range and level of functions the wetland provides. Disturbances that can lead to wetland dominance by invasive non-native and opportunistic native plant species include altered water regimes, filling, and disturbance to soils. Non-native species that are dominant in the study area include Himalayan blackberry, evergreen blackberry *(Rubus laciniatus)*, reed canarygrass, and purple loosestrife *(Lythrum salicaria)*. Portions of Mercer Slough and Bear Creek, and the small Mercer Slough tributary is dominated by a solid Himalayan blackberry monoculture. The riparian emergent stratum at Sturtevant Creek is solid reed canarygrass that reaches nearly 4 feet in height. Native opportunistic plant species include soft rush (*Juncus effusus*) and horsetail (*Equisetum arvense* and *E. telmatiea*). Both of these species were present in most of the wetlands surveyed.

3.3.1.3 Hydrology

Signs of altered hydrology were evident throughout the study area. Along Segment B, portions of wetland that were once a part of the main Mercer Slough complex are separated by paved roads, office complexes, and medium-density residential communities. Hydrologic connection between these wetlands and Mercer Slough still exists via culverts that run beneath 118th Avenue SE as well as via groundwater movement. In addition, several wetland complexes have been created or enlarged due to human activities in the study area. Both drainage wetlands adjacent to Valley Creek in Segment D (WR-10E, WR-10W, and WR-11) receive most of their source water from SR 520 runoff and other impervious surface runoff from surrounding office and retail buildings and parking lots. In Segment E, the Marymoor Park mitigation wetland (WR-13) was built in a historic floodplain area of Bear Creek. The surface and floodwater connection between the area south of SR 520 and Bear Creek, however, has been severed due to road and building construction in the Redmond area.

3.3.1.4 Jurisdictional Determination

Sound Transit has not requested formal wetland jurisdictional determinations from the local, state, or federal regulatory agencies. Some jurisdictions may not regulate all the wetlands. During permitting of the preferred alternatives, Sound Transit will request jurisdictional determinations of those wetlands that are likely to be affected along the preferred alternative routes.

3.3.2 Wetland Descriptions

The following section describes the wetland complexes located in the study area by segment as illustrated in Exhibits 3-27 through 3-29 and listed in Table 3-11.

3.3.2.1 Segment B

Mercer Slough Wetland (WR-1/2)

The Mercer Slough wetland complex is located in the southwestern quadrant of Bellevue. One hundred and fifty years ago, Mercer Slough and its wetlands were a mix of swamps, marshes, and shallow watered areas along Lake Washington. When the Lake Washington Ship Canal and Hiram Chittenden Locks were completed in 1916, the water level in Lake Washington dropped approximately 10 feet, exposing most of the banks now seen along Mercer Slough. Today, the 326-acre Mercer Slough Nature Park encompasses most of the remaining wetland complex and the slough. For this study, the Mercer Slough wetland includes WR-1/2, and four smaller sub-wetlands that are hydrologically connected to Mercer Slough and exist outside the park's boundaries—Sturtevant Creek wetland (WR-3) to the north, 118th Avenue SE wetland (WR-5) to the east, the Mercer Slough/I-90 wetland (WR-4) to the southeast near 118th Avenue SE and I-90 overpass, and the Bellefield Lane Park wetland (WR-14) to the northwest. Bellevue (2008) prepared an inventory of the shoreline-associated wetlands surrounding Mercer Slough as part of an update to their Shoreline Master Plan (SMP).

EXHIBIT 3-30
Mercer Slough Wetland (WR-1/2)

The Mercer Slough wetland is a mixture of palustrine forested (PFO), palustrine scrub-shrub (PSS), and palustrine emergent marsh (PEM) wetlands. Many, if not most, of the wetlands in the Mercer Slough complex grow in deep organic soils. PEM dominates the east and west tributaries of Mercer Slough. Throughout Mercer Slough Nature Park, reed canarygrass dominates the understory. Dominant tree species of PFO/PSS include black cottonwood (*Populus balsamifera*) and red alder, with an understory of willow (*Salix* spp.), red-osier dogwood (*Cornus sericea*), and salmonberry (*Rubus spectabilis*). In disturbed areas, Himalayan blackberry is also common in the shrub layer, primarily along the West Tributary to Mercer Slough, near the I-90 overpass at the southern end of the park, and along the park boundary adjacent to Bellevue Way SE (see Exhibit 3-30).

The southern and mid-section of Mercer Slough Nature Park support several different wetland types. Lake Washington forms the southern boundary of the park. Emergent vegetation with patches of shrubs and small trees dominate the wetlands just north of the lake. Labrador tea (*Ledum groenlandicum*) with a shrub overstory of Pacific willow (*Salix lasiandra*) dominates the PEM/PSS situated in the central portion of the park. Soils found in this area of Mercer Slough Nature Park are peat and Seattle muck.

The northern section of the park is highly fragmented and disturbed. Office complexes are located within 20 feet of Mercer Slough West. Himalayan blackberry and other non-native plant species dominate the banks of the slough. A portion of the wetland on the west side of the park remains drained and pumped for the production of blueberries. The City of Bellevue (2008) rated Mercer Slough wetland as Category 2. In addition there are five WSDOT wetland mitigation sites and two Marriott mitigation sites within Mercer Slough Nature Park (see Table 3-12 and Exhibit 3-27).

Mercer Slough/I-90 Wetland (WR-4)

Located where I-90 crosses 118th Avenue SE, the Mercer Slough/I-90 wetland receives runoff from I-90 and an office park complex adjacent to the wetland. Water quality observed during field visits in March 2007 was low. The water emitted a faint sulfidic odor, and thick mats of orange bacteria were present throughout the length of the watercourse. Salmonberry is the dominant shrub, and the forest canopy is well established with red alder and black cottonwood. This site has patches of Japanese knotweed *(Polygonum cuspidatum)* along its southern bank. Sound Transit rated this wetland as Category 4 (see Exhibit 3-31).

EXHIBIT 3-31
Mercer Slough/I-90 Wetland (WR-4)

118th Avenue SE Wetland (WR-5)

This forested depressional wetland is located between I-405 and 118th Avenue SE on property that formerly housed a WSDOT facility. The wetland discharges to Mercer Slough through a culvert under 118th Avenue SE. As part of the *I-405 Bellevue Nickel Improvement Project* in 2006, WSDOT (2006) rated this wetland as Category 2 (referred to in their document as Wetland 12.4L). Willow and red alder dominate the wetland, and it also contains reed canarygrass (see Exhibit 3-32).

EXHIBIT 3-32
118th Avenue SE Wetland (WR-5)

Sturtevant Creek Wetland (WR-3)

Sturtevant Creek emerges from Lake Bellevue and travels southwest towards Mercer Slough. Just north of Mercer Slough, a riparian wetland complex has developed on the east and west banks of Sturtevant Creek. This wetland complex has good diversity of shrubs established within its boundary, including Pacific ninebark (*Physocarpus capitatus*), Douglas spirea, red-osier dogwood, Indian plum *(Oemleria cerasiformis)*, salmonberry, willow, and cottonwood and alder saplings. The herbaceous layer is a monoculture of reed canarygrass. Himalayan blackberry is also found in several thickets. Bellevue (2008) rated this wetland as Category 2 (see Exhibit 3-33).

Bellefield Park Lane Wetland (WR-14)

According to the City of Bellevue (2008), the Bellefield Park Lane Wetland is an approximately 0.6-acre depressional wetland surrounded by an apartment complex. It is located west of 112th Avenue SE, which separates the wetland from the Mercer Slough wetland. Water drains from the wetland through a culvert beneath 112th Avenue SE and cascades approximately 10 to 15 vertical feet down a channel into Mercer Slough West. The wetland contains a large, permanently inundated pond, surrounded by saturated areas. Reed canarygrass, buttercup, and lady fern grow along banks of the inundated area with some black cottonwood, weeping willow, and alder interspersed occasionally. Bellevue (2008) rated this wetland as Category 4.

EXHIBIT 3-33
Sturtevant Creek Wetland (WR-3)

3.3.2.2 Segment C

Hilton Stormwater Pond (WR-16)

This small (0.2-acre) depressional stormwater pond is located between the Hilton Hotel and Sturtevant Creek (Exhibit 3-34). Wetland characteristics were observed around the pond. Vegetation consists of a band of unmowed, thick-stemmed emergent and mowed bird’s foot trefoil (*Lotus corniculatus*) around three sides of the open water pond. One red alder tree is located on the west side of the pond. Water marks observed on the wall that forms the northern side of the pond indicate that the water surface elevation rises approximately 18 inches above the summer low. The wetland offers no special habitat features and has only mowed park-like and developed

EXHIBIT 3-34
Hilton Hotel Stormwater Pond (WR-16)

buffers. Sound Transit rated the wetland as Category 3. Some or all of the jurisdictions may not regulate this pond as a wetland. Sound Transit will discuss the jurisdictional determination of this pond with the regulatory agencies during the permitting process.

3.3.2.3 Segment D

BNSF Matrix Wetland (WR-6)

In January 2008 the Watershed Company (2008a) conducted a wetland delineation study for the Children's Hospital project that has been constructed and is now operating. This wetland information was incorporated into the database for the East Link Final EIS because it is more current and more detailed than the initial reconnaissance that Sound Transit conducted for the Draft EIS. According to the report prepared by the Watershed Company (2008a), WR-6 is a depressional palustrine forested wetland, which flows to an adjacent drainage ditch east of the property boundary along the neighboring former BNSF Railway corridor (Exhibit 3-35). Groundwater and precipitation are the primary sources of hydrology. Dominant vegetation in the wetland consists of black cottonwood, Pacific willow, hardhack, and Himalayan blackberry. The Watershed Company (2008a) rated this wetland as Category 3.

EXHIBIT 3-35
BNSF Matrix Wetland (WR-6)

120th Avenue NE/NE 12th Street Wetland (WR-17)

In July of 2010, the City of Bellevue conducted a delineation of the 120th Avenue NE/NE 12th Street wetland (WR-17) on the east side of 120th Avenue NE and immediately north of NE 12th Street (City of Bellevue, 2010a). This long, narrow depressional wetland is located at the toe of a disturbed slope between 120th Avenue NE and an industrial building (see Exhibit 3-36). Moist, hydric soils were found in the wetland. Hydrology appears to enter the wetland via surface and ground water and drain slowly through culverts to the south into Lake Bellevue. Dominant vegetation in this scrub-shrub wetland includes Pacific willow (*Salix lasiandra*), Douglas spirea, and an emergent stratum of bentgrass (*Agrostis* sp.). The wetland is roughly 0.2 acre in size and was rated Category 3.

EXHIBIT 3-36
120th Avenue NE/NE 12th Street Wetland (WR-17)

West Tributary to Kelsey Creek Riparian (WR-8NW, WR-8N, and WR-8SE) and Ponded (WR-7) Wetlands

The four wetlands identified in the study area along the West Tributary to Kelsey Creek are largely narrow, fringe wetlands growing along the creek and encroached by surrounding development. Riparian uplands extend for several more feet upslope of the fringe riparian wetlands.

Four ponds exist along the West Tributary to Kelsey Creek in the study area near the King County Metro Maintenance Base along 124th Avenue NE. A beaver dam at the road culvert forms a small pond to the west of 124th Avenue NE (wetland WR-8N). Just northwest of this wetland and upstream from a private road, is another similar riparian wetland (WR-8NW), which is formed by a beaver dam at the culvert that crosses under the private road (Exhibit 3-12). To the east of 124th Avenue NE, a flood control dam installed at the south end of the pond system has converted this reach of the West Tributary to Kelsey Creek into a stormwater detention pond (wetland WR-7), and several snags and weakened trees remain in the center of this pond (Exhibit 3-10). Shallow water and low-lying banks of the detention pond support a thick growth of reed canarygrass, while the upper banks are covered with shrubs and trees. Downstream of the detention pond dam, water collects in a small pond with an associated PEM/PSS wetland WR-8SE dominated by reed canarygrass, red-osier dogwood, and black cottonwood. The creek flows out of this pond over a weir and into a pipe system (Exhibit 3-11). All three ponded sections of the West Tributary are rated as Category 3 wetlands (see Exhibit 3-37).

Allied Waste Wetland (WR-9)

During field investigations, a small Category 4 wetland was located to the east of the Allied Waste Facilities parking lot. The wetland is located behind a retail office complex between 124th Avenue NE and 130th Avenue NE, and heavy industrial and retail development surround the site. The wetland measures roughly 30 feet by 30 feet and is dominated by reed canarygrass and Himalayan blackberry. Stormwater from the surrounding buildings drains into the wetland by following a 1- to 3-foot-wide drainage channel. The drainage ditch supports wetland plants tolerant of disturbances, including horsetail and soft rush. Soils in the canarygrass/blackberry patch were fill soils that met hydric soil criteria because mottles were present within 10 inches of the surface.

EXHIBIT 3-37
West Tributary to Kelsey Creek Riparian Wetland (WR-8SE)

East of 140th Avenue NE Wetlands (WR-10E and WR-10W)

In May 2009, Sound Transit delineated two separate wetlands east of 140th Avenue NE. The western wetland (WR-10W) is a riverine wetland with forested, shrub, and emergent vegetation classes associated with Valley Creek that flows from the north through two culverts under SR 520, and a small drainage swale that enters from the east (Exhibit 3-38). Valley Creek is the primary source of hydrology for the side of this wetland west of Valley Creek; the drainage swale receives stormwater runoff from adjacent parking lots, office buildings, and retail complexes. Dominant vegetation in the wetland included black cottonwood, red alder, Sitka and Pacific willow, Douglas spirea, and reed canarygrass. An unusual building at this location was constructed within the Valley Creek floodplain. The structure is built to allow floodwaters to flow under the building, although shading prevents vegetation from growing. The emergent vegetation in this wetland is regularly mowed. Sound Transit rated wetland WR-10W as Category 2.

EXHIBIT 3-38
East of 140th Avenue NE Wetland (WR-10W)

The eastern wetland (WR-10E) is a long, narrow, forested depression that forms a drainage swale between the SR 520 embankment and the fill from parking lots and building foundations (Exhibit 3-39). The drainage swale receives stormwater runoff from adjacent parking lots, office buildings, and retail complexes. Dominant vegetation in the wetland includes black cottonwood, red alder, Sitka willow, Douglas spirea, salmonberry, and reed canarygrass. Sound Transit rated wetland WR-10E as Category 4.

EXHIBIT 3-39
East of 140th Avenue NE Wetland (WR-10E)

West of 140th Avenue NE Wetland (WR-11)

In May 2009, Sound Transit delineated a long, narrow, forested depressional wetland west of 140th Avenue NE that forms a drainage between the SR 520 embankment and the fill from parking lots and building foundations (Exhibit 3-40). Dominant vegetation in the wetland included black cottonwood, red alder, Sitka and willow, Douglas spirea, red-osier dogwood, salmonberry, and reed canarygrass.

No surface connection of this wetland to Valley Creek was observed. Brown water observed in the wetland suggests water quality concerns. Trash was also abundant in the wetland, the likely result of stormwater draining directly to the wetland, and/or littering from adjacent business parking lots. Sound Transit rated this wetland as Category 3.

EXHIBIT 3-40
West of 140th Avenue NE Wetland (WR-11)

Unnamed Tributary to Kelsey Creek Wetland (WR-15)

In October 2009, Sound Transit delineated several narrow riverine emergent wetlands associated with the roadside ditches along 136th Place NE that convey the Unnamed Tributary to Kelsey Creek (Exhibits 3-41 and 42). Water was flowing in the ditches at the time of the field visit. These ditches appeared to be connected by several culverts under 136th Place NE. In ditch segments that were mowed, vegetation was dominated by reed canarygrass, bird's-foot trefoil, and buttercup. Japanese knotweed was also observed. Woody vegetation was generally absent. At the time of the field visit, BMW of Bellevue was under permit to widen an existing vehicle entry off of 136th Place NE, and this affected a portion of a roadside biofiltration swale. Mapping of this riparian bioswale was obtained from the Sensitive Areas Study prepared for that project by Talasaea Consultants (2007).

3.3.2.4 Segment E

Bear Creek Wetland (WR-12)

Bear Creek is part of the greater Lake Washington-Cedar River drainage, which includes Lake Sammamish and the Sammamish River and extends to Lake Washington. The Bear Creek drainage is 14,300 acres, and the creek itself is 12.4 miles long. Wetlands along the creek receive floodwaters regularly during the winter as well as during spring rain and snowmelt events. There are extensive restoration and flood detention projects along Bear Creek. The wetland and buffer areas along the creek where the *Preferred Alternative E2* and Redmond Way (E1) and Leary Way (E4) Alternatives are proposed to cross are heavily infested with reed canarygrass and Himalayan blackberry. In several areas, these two plant species exclude all other plant growth. Restoration activities downstream have removed the blackberry and most of the canarygrass and replaced non-native plants with native shrubs and tree saplings. A floodplain enhancement project along the south side of Bear Creek at the former BNSF Railway crossing buffers the creek from SR 520 and prevents any overbank flooding into surrounding upland areas. Willow cuttings and other shrubs have been planted to slow water flow through the detention area during flood events. The Bear Creek wetland is a Category 2 wetland.

EXHIBIT 3-41
Unnamed Tributary to Kelsey Creek Wetland (WR-15)

EXHIBIT 3-42
View of Unnamed Tributary to Kelsey Creek Wetland (WR-15)

Marymoor Park Mitigation Wetland (WR-13)

Historically, Marymoor Park received flood water from Bear Creek. In the late 1800s, pioneers drained and farmed the area. Today, Marymoor Park is a 630-acre facility with several natural wetlands and a mitigated wetland located on the property. The park's mitigation wetland is located adjacent to the Velodrome and is bordered to the north by SR 520. The wetland was created to compensate for impacts on a natural wetland that occurred in the early 1990s during the widening of the SR 520. The mitigation wetland was planted with a variety of native trees and shrubs, and site visits in March and April of 2007 found the plantings thriving and in good health, with red alder, black cottonwood, and wild rose dominating the site. However, reed canarygrass is invading the site and competing with the native plants for resources. The Marymoor Park mitigation wetland is a Category 3 wetland.

3.3.3 Wetland Mapping

The 17 wetlands identified in the East Link Project wetland analysis are expected to be jurisdictional wetlands regulated by the local jurisdictions, Department of Ecology, and/or the USACE. Exhibits 3-27 to 3-29 show the 17 wetlands. Table 3-11 shows the location for each wetland resource and indicates where each resource is located in reference to the project alternatives. In Appendix F, Attachment 1, the wetlands are labeled as WR-1 through WR-17.

3.3.4 Wetland Ratings

Of the 17 delineated wetlands in the study area, five are Category 2, eight are Category 3, and four are Category 4 (Table 3-12).

Listed below are the highest category wetlands in the study area (Category 2), which are the larger, more complex wetlands and are mostly associated with streams:

- Mercer Slough Wetland (WR-1/2)
- Sturtevant Creek Wetland (WR-3)
- 118th Avenue SE Wetland (WR-5)
- East of 140th Avenue NE Wetland (WR-10W)
- Bear Creek Wetland (WR-12)

3.4 Wetland Function Assessment

The existing functions and attribute levels vary among project wetlands for several reasons: the location of the wetland in the landscape, the surrounding land use activities, and the past type and level of disturbances the wetland experienced. The scores for each wetland function (i.e., hydrologic, water quality, and habitat) are shown in Table 3-13.

Based on the *Rating System*, most of the wetlands that would be affected generally provide a moderate "potential" to improve water quality, and all have the "opportunity" to provide this function. These wetlands on average have a moderate potential to provide hydrologic functions, and the majority have the opportunity to provide these functions. All these wetlands have a moderate potential to provide habitat functions, and vary from low to moderate in their opportunity to provide habitat functions. Table 3-13 summarizes the potential and opportunity for each wetland to provide these functions. Using the scores obtained from the rating forms for each wetland, a qualitative functional rating (high, moderate, or low as defined in Table 3-14) is included in Table 3-13 and was based on the supplemental guidance provided by Ecology (2006a).

Chapter 4

Environmental Consequences

This section describes the expected temporary construction and permanent operational impacts of the East Link Project on the following resources:

- Aquatic resources (see Section 4.1)
- Vegetation, wildlife habitat, and wildlife resources, including Washington PHS, threatened and endangered species, and species of concern (see Section 4.2)
- Wetland resources (see Section 4.3)

The discussion of project impacts assumes that the BMPs described in Appendix A would be implemented and performed as expected to avoid and minimize certain impacts during construction. For potential mitigation measures, see Chapter 5.

During the Final EIS process, Sound Transit prepared a Biological Assessment for ESA consultation. Sound Transit expects that the Biological Assessment's effects determination for ESA-listed species will be a "may affect, not likely to adversely affect" and that there will be no adverse effects to Essential Fish Habitat under the Magnuson-Stevens Fishery Conservation and Management Act (MSA).

4.1 Aquatic Resources

Sound Transit considered the following potential impacts on aquatic resources:

- Direct fish mortality
- Permanent loss of physical habitat
- Permanent degradation of in-stream physical habitat, such as shading, chronic sedimentation, removal of boulders or LWD from the channel, and loss of riparian vegetation function (loss of nutrient inputs, LWD recruitment, and shade)
- Temporary loss of physical habitat (dewatering)
- Temporary degradation of habitat (sedimentation, removal of riparian vegetation, disturbance to stream banks)
- Altered hydrology (higher peak flows = increased scour/deposition downstream; decreased percolation from impervious surfaces = lower base flows)
- Permanent degradation of water quality (increased temperature, increased turbidity, increased loading of heavy metals and hydrocarbons)
- Lighting
- Temporary or permanent degradation of water quality (turbidity, temperature, toxicants)
- Impacts on fish passage at culverts and new culverts
- Facilitation of urban development
- Stray electric current field in Lake Washington
- Beneficial impacts associated with in-stream and riparian restoration, and daylighting existing culverts

Not all of these types of potential impacts would occur from the East Link Project. Impacts that are not discussed in this section are not expected to occur.

The analysis focuses on salmonids because it is the group of species of greatest concern in Pacific Northwest freshwater environments. Because the habitat requirements and mode of potential impacts are so similar for the salmonid species present, the analysis is generic and combined for all salmonid species. Species-specific impacts are identified where appropriate. The federally listed threatened and endangered aquatic species present in the study area are all salmonids and covered under in the combined analysis. The discussion herein is thus limited to the potential for impacts to each species based on the proximity of their known habitat in the project vicinity to sources of potential impacts from the project. A discussion of impacts relative to the MSA is similarly lumped into the generic analysis and not discussed separately.

4.1.1 Impacts Common to Most or All Build Alternatives

Table 4-1 summarizes potential temporary construction and permanent operational impacts, by segment and alternative, common to most or all the build alternatives.

4.1.1.1 Temporary Construction Impacts

Sedimentation and Turbidity

Any earthwork conducted within a watershed has the potential to cause sedimentation that would adversely affect the streams in the watershed downstream of the work. The most obvious situation in which sedimentation could occur is where earthwork construction occurs in or next to a stream channel. However, any earthwork in a watershed might contribute to the already serious sedimentation problems that exist in the streams in the project vicinity. This is because most stormwater in urban settings is collected in a system of pipes or ditches and conveyed directly to the nearest stream. An exception to this is in newer developments, where stormwater detention facilities trap much of the sediment carried by upstream sources before discharging into streams. But even in these developments, some of the finer particulates might be discharged to streams as the ponds fill with stormwater and overflow.

As defined in Section 1.4.1.1, sedimentation risk is the inherent potential for erosion to cause sediment-related impacts on aquatic resources based on the proximity of earthwork to streams and site conditions. The closer the earthwork is to a stream, the higher the risk of sediment delivery into the stream. In addition, earthwork that occurs during the wet season has a higher risk of delivering sediment to streams. The likelihood of sedimentation impact is the inherent risk at a given site minus the performance of the BMPs implemented to contain the risk. Impacts from turbidity are lesser than sediment deposition but cover greater areas due to the slower rate of settling out of the water column.

The types of adverse impacts from excessive sediment in streams are well documented, and the range of adverse impacts on salmonid ecosystems is wide. For example, excessive sediment might preclude salmonid spawning or successful egg incubation, or it might lower egg survival. The production and diversity of macrobenthic invertebrates, the primary food source of juvenile salmon and resident trout, is reduced as sediment loading increases. Shelter for juvenile salmonids is decreased as the voids between rocks are filled with sediment. Pools may become full of sediment if loading is high.

Alternatives with more earthworks, such as the alternatives with the most elevated guideways, which require more access roads, have higher sedimentation risk. In addition to more and wider access roads, elevated guideway sections are often required due to traversing steep terrain. Earthwork in steep terrain has the highest sedimentation risk. Tunneling alternatives, where the earthwork is sheltered and isolated from rainfall and stormwater runoff, have the lowest sedimentation risk. However, tunnels are not without sedimentation risk. Tunnels must be dewatered to remove groundwater seepage. This water can be treated to remove most of the particulates, but some may still be present after treatment. After treatment, the water is either discharged; ultimately ending up in streams through stormwater systems, or it is injected back into the ground. The at-grade alternatives, where there would be minimal road widening and access often from paved surfaces, have an intermediate level of sedimentation risk.

Erosion control BMPs are designed to avoid or minimize sediment delivery to streams. The degree to which they are effective depends on correct installation but also on unpredictable circumstances. For instance, conventional BMPs may fail when subjected to extreme rainfall or rain-on-snow events. Examples of BMPs are delineated construction limits; silt fences; protective ground covers such as straw, plastic sheeting, or jute mats; and straw bales in drainage features.

TABLE 4-1
Summary of Temporary Construction and Permanent Operational Impacts on Aquatic Resources

Segment/Alternative/ Connection	Water Body Affected	Type of Construction Activities and Locations	Potential Temporary Construction Impacts	Potential Permanent Operational Impacts
Segment A				
Preferred Interstate 90 Alternative (A1)	Lake Washington	Bridge joint replacement, track installation, possible in-water work for bridge upgrades.	Small potential fuel spilled from heavy equipment.	None.
Segment B				
Preferred 112th SE Modified Alternative (B2M) to C11A	Mercer Slough	Elevated and at-grade construction along Bellevue Way, 112th Avenue SE, and SE 8th Street.	Moderate potential for water quality degradation from runoff of sediment and pollutants at Mercer Slough. Stream buffer clearing for 1,690 linear feet (1.2 acre).	Worsened stream buffer encroachment along Mercer Slough for approximately 960 feet. A loss of 0.4 acre of stream buffer. Low-quality vegetation replaced by high-quality vegetation in the remaining buffer.
Preferred Alternative112th SE Modified Alternative (B2M) to C11A	Mercer Slough	Elevated and at-grade track construction along Bellevue Way and 112th Avenue SE.	Potential water quality degradation from runoff of sediment and pollutants.	Worsened stream buffer encroachment along Mercer Slough for about 350 feet.
Preferred 112th SE Modified Alternative (B2M) to C9T	Mercer Slough	Elevated and at-grade construction along Bellevue Way and 112th Avenue SE.	Moderate potential for water quality degradation from runoff of sediment and pollutants. Stream buffer clearing for linear 2,110 feet (1.0 acre).	Worsened stream buffer encroachment along Mercer Slough for approximately 1,660 feet. A loss of 1.1 acre of stream buffer. Blackberries replaced by quality vegetation in the remaining buffer.
Bellevue Way Alternative (B1)	Mercer Slough	At-grade track installation and the widening of Bellevue Way SE between I-90 and 12th Street intersection.	None.	None.
112th SE At-Grade Alternative (B2A)	Mercer Slough	Elevated and at-grade track construction along Bellevue Way SE and at grade construction along 112th Avenue SE.	Small potential water quality degradation from runoff of sediment and pollutants. Stream buffer clearing for 1,380 feet (0.5 acre).	Worsened stream buffer encroachment along Mercer Slough for about 710 feet. A loss of 0.1 acre of stream buffer. Low-quality vegetation replaced by high-quality vegetation in the remaining buffer.
112th SE Elevated Alternative (B2E)	Mercer Slough	Elevated track construction along Bellevue Way and112th Avenue SE.	Small potential water quality degradation from runoff of sediment and pollutants. Clearing 1,540 linear feet of stream buffer (0.7 acre).	Worsened stream buffer encroachment along Mercer Slough for about 1,580 feet. A loss of 0.4 acre of stream buffer. Low-quality vegetation replaced by high-quality vegetation in the remaining buffer.
112th SE Bypass Alternative (B3)	Mercer Slough	Elevated and at-grade track construction along Bellevue Way and 112th Avenue SE.	Small potential water quality degradation from runoff of sediment and pollutants. Stream buffer clearing for 1,260 feet (0.5 acre).	Worsened stream buffer encroachment along Mercer Slough for about 750 feet. A loss of 0.1 acre of stream buffer. Low-quality vegetation replaced by high-quality vegetation in the remaining buffer.

TABLE 4-1 CONTINUED
Summary of Temporary Construction and Permanent Operational Impacts on Aquatic Resources

Segment/ Alternative/ Connection	Water Body Affected	Type of Construction Activities and Locations	Potential Temporary Construction Impacts	Potential Permanent Operational Impacts
B3 - 114th Extension Design Option	Mercer Slough, Sturtevant Creek	At-grade construction along Mercer Slough, Elevated crossing of Sturtevant Creek.	Moderate potential water quality degradation from runoff of sediment and pollutants. Stream buffer clearing for 1,970 linear feet (1.3 acre).	Worsened stream buffer encroachment along Mercer Slough for about 1,000 feet. A loss of 0.3 acre of stream buffer. Low-quality vegetation replaced by high-quality vegetation in the remaining buffer. Elevated structure over water.
BNSF Alternative (B7)	Mercer Slough and Kelsey Creek	Elevated and at-grade track construction between113th Avenue SE and SE 8th Street.	Moderate potential for water quality degradation from runoff of sediment and pollutants. Stream buffer clearing for 300 feet (0.3 acre).	Loss of 0.2 acre of stream buffer. Elevated structure over water.
Segment C				
Preferred 108th NE At-Grade Alternative (C11A) from B2M	Sturtevant Creek	At-grade track installation, elevated track construction in the watershed. The channel would be diverted under the BNSF tracks and relocated next to the Hospital Station for approximately 300 feet.	Moderate potential for water quality degradation from runoff of sediment and pollutants.	Channel relocation next to the Hospital Station would be an improvement.
Preferred 108th NE At-Grade Alternative (C11A) from B3	Sturtevant Creek	Street widening and elevated track construction within watershed. Elevated guideway construction close to the creek for 420 feet and crosses it twice next to the Hilton Hotel. The channel would be diverted under the BNSF tracks and relocated next to the Hospital Station for approximately 300 feet.	Moderate potential water quality degradation from runoff of sediment and pollutants.	Impacts on stream buffer at creek crossings and where the guideway is close and parallel to the channel. Channel relocation next to the Hospital Station would be an improvement.
Preferred 108th NE At-Grade Alternative (C11A) from B3 Design Option or B7	Sturtevant Creek	Street widening and elevated track construction within watershed. Elevated guideway construction close to the creek for 720 feet and crosses it when next to the Hilton Hotel. The channel would be diverted under the former BNSF Railway tracks and relocated next to the Hospital Station for approximately 300 feet.	Moderate potential for water quality degradation from runoff of sediment and pollutants.	Impacts on stream buffer at creek crossings and where the guideway is close and parallel to the channel. Channel relocation next to the Hospital Station would be an improvement.
Preferred 110th NE Tunnel Alternative (C9T) from B2M	Sturtevant Creek	Same as *Preferred Alternative C11A* from *B2M.*	Same as *Preferred Alternative C11A* from *B2M.*	Same as *Preferred Alternative C11A* from *B2M.*
Preferred 110th NE Tunnel Alternative (C9T) from B3	Sturtevant Creek	Same as *Preferred Alternative C11A* from B3.	Same as *Preferred Alternative C11A* from B3.	Same as *Preferred Alternative C11A* from B3.
Preferred 110th NE Tunnel Alternative (C9T), including East Main Station Design Option, from B3 Design Option or B7	Sturtevant Creek	Same as *Preferred Alternative C11A* from B3 Design Option or B7.	Same as *Preferred Alternative C11A* from B3 Design Option or B7.	Same as *Preferred Alternative C11A* from B3 Design Option or B7.

TABLE 4-1 CONTINUED
Summary of Temporary Construction and Permanent Operational Impacts on Aquatic Resources

Segment/ Alternative/ Connection	Water Body Affected	Type of Construction Activities and Locations	Potential Temporary Construction Impacts	Potential Permanent Operational Impacts
Bellevue Way Tunnel Alternative (C1T)	Sturtevant Creek	Same as *Preferred Alternative C11A* from *B2M*.	Same as *Preferred Alternative C11A* from *B2M*.	Same as *Preferred Alternative C11A* from *B2M*.
106th NE Tunnel Alternative (C2T) from B2A or B2E	Sturtevant Creek	Same as *Preferred Alternative C11A* from *B2M*	Same as *Preferred Alternative C11A* from *B2M*.	Same as *Preferred Alternative C11A* from *B2M*.
106th NE Tunnel Alternative (C2T) from B3 112th SE	Sturtevant Creek	Same as *Preferred Alternative C11A* from B3	Same as *Preferred Alternative C11A* from B3.	Same as *Preferred Alternative C11A* from B3.
106th NE Tunnel Alternative (C2T) from B7	Sturtevant Creek	Same as *Preferred Alternative C11A* from B3 Design Option or B7.	Same as *Preferred Alternative C11A* from B7.	Same as *Preferred Alternative C11A* from B3 Design Option or B7.
108th NE Tunnel Alternative (C3T) from B2A or B2E	Sturtevant Creek	Tunneling or elevated guideway distant from water bodies.	Negligible.	None.
108th NE Tunnel Alternative (C3T) from B3	Sturtevant Creek	Tunneling and elevated guideway construction close to the creek for 420 feet and crosses creek twice next to the Hilton Hotel.	Moderate potential water quality degradation from runoff of sediment and pollutants.	Impacts on stream buffer at creek crossings and where the guideway is close and parallel to the channel.
108th NE Tunnel Alternative (C3T) from B7	Sturtevant Creek	Tunneling and elevated track construction within watershed. Elevated guideway construction close to the creek for 720 feet and crosses creek once next to the Hilton Hotel.	Moderate potential for water quality degradation from runoff of sediment and pollutants.	Impacts on stream buffer at creek crossings and where the guideway is close and parallel to the channel.
At-Grade Couplet Alternative (C4A) from B2A or B2E	Sturtevant Creek	Street widening and elevated track construction within watershed.	Minimal potential for water quality degradation from runoff of sediment and pollutants.	None.
At-Grade Couplet Alternative (C4A) from B3	Sturtevant Creek	Street widening and elevated track construction within watershed. Elevated guideway construction close to the creek for 420 feet and crosses it twice next to the Hilton Hotel.	Same as C3T from B3.	Same as C3T from B3.
At-Grade Couplet Alternative (C4A) from B7	Sturtevant Creek	Street widening and elevated track construction within watershed. Elevated guideway construction close to the creek for 720 feet and crosses it once next to the Hilton Hotel.	Same as C3T from B7.	Same as C3T from B7.
112th NE Elevated Alternative (C7E) from B2A or B2E	Sturtevant Creek	Elevated guideway construction in the watershed away from streams.	Minimal potential for water quality degradation from runoff of sediment and pollutants.	None.

TABLE 4-1 CONTINUED
Summary of Temporary Construction and Permanent Operational Impacts on Aquatic Resources

Segment/ Alternative/ Connection	Water Body Affected	Type of Construction Activities and Locations	Potential Temporary Construction Impacts	Potential Permanent Operational Impacts
110th NE Elevated Alternative (C8E) from B3	Sturtevant Creek	Elevated guideway construction close to the creek for 420 feet and crosses it twice next to the Hilton Hotel.	Same as C3T from B3.	Same as C3T from B3.
110th NE Elevated Alternative (C8E) from B7	Sturtevant Creek	Elevated guideway construction close to the creek for 720 feet and crosses creek twice next to the Hilton Hotel.	Same as C3T from B7.	Same as C3T from B7.
110th NE At-Grade Alternative (C9A) from B2A or B2E	Sturtevant Creek	Same as *Preferred Alternative C11A* from *B2M*.	Same as *Preferred Alternative C11A* from *B2M*.	Same as *Preferred Alternative C11A* from *B2M*.
110th NE At-Grade Alternative (C9A) from B3	Sturtevant Creek	Same as *Preferred Alternative C11A* from B3.	Same as *Preferred Alternative C11A* from B3.	Same as *Preferred Alternative C11A* from B3.
110th NE At-Grade Alternative (C9A) from B7 or B3 - 114th Design Option	Sturtevant Creek	Same as *Preferred Alternative C11A* from B3 Design Option or B7.	Same as *Preferred Alternative C11A* from B3 Design Option or B7.	Same as *Preferred Alternative C11A* from B3 Design Option or B7.
114th Avenue NE Elevated Alternative (C14E) from B3	Sturtevant Creek	Same as *Preferred Alternative C11A* from B3.	Same as *Preferred Alternative C11A* from B3.	Same as *Preferred Alternative C11A* from B3.
114th Avenue NE Elevated Alternative (C14E) from B7 or B3 - 114th Design Option	Sturtevant Creek	Same as *Preferred Alternative C11A* from B3 Design Option or B7.	Same as *Preferred Alternative C11A* from B3 Design Option or B7.	Same as *Preferred Alternative C11A* from B3 Design Option or B7.
Segment D				
Preferred NE 16th At-Grade Alternative (D2A) via BNSF (C1T, C2T), including both D2A – 120th Station and NE 24th Design Options	West Tributary to Kelsey Creek, Goff Creek, Unnamed Tributary to Kelsey Creek, Valley Creek	Elevated and at-grade earthwork in watersheds; elevated crossings at West Tributary; crossing a piped section of Goff Creek; lengthening of a culvert on the Unnamed Tributary.	Minor potential water quality degradation from runoff of sediment and pollutants at the West Tributary. Minimal potential at Unnamed Tributary and Valley Creek.	Impacts on stream buffer on West Tributary. 130 feet of new culvert on the Unnamed Tributary.
NE 16th Elevated Alternative (D2E), NE 12th (C3T, C4A, C7E, C14E) and via former BNSF (C1T, C2T)	West Tributary to Kelsey Creek, Goff Creek, Unnamed Tributary to Kelsey Creek, Valley Creek	Same as *Preferred Alternative D2A.*	Same as *Preferred Alternative D2A* except only a minimal potential for sedimentation impacts.	Same as *Preferred Alternative D2A.*
NE 20th Alternative (D3), NE 12th (C3T, C4A, C7E, C8E) and via former BNSF (C1T, C2T)	West Tributary to Kelsey Creek, Goff Creek, Unnamed Tributary to Kelsey Creek, Valley Creek	Elevated and at-grade earthwork in watersheds; elevated crossing at West Tributary; at-grade crossing a piped section of Goff Creek; lengthening of a culvert on the Unnamed Tributary; culvert lengthening of Valley Creek and a retained cut crossing over a piped section of Sears Creek.	Minimal potential for water quality degradation from runoff of sediment and pollutants at the West Tributary and Unnamed Tributary. Minor potential impacts at Valley Creek.	Impacts on stream buffer on West Tributary. Loss of all stream function and habitat for 30 feet on Valley Creek. About 130 feet of new culvert on the Unnamed Tributary.

TABLE 4-1 CONTINUED
Summary of Temporary Construction and Permanent Operational Impacts on Aquatic Resources

Segment/ Alternative/ Connection	Water Body Affected	Type of Construction Activities and Locations	Potential Temporary Construction Impacts	Potential Permanent Operational Impacts
SR 520 Alternative (D5), NE 12th (C3T, C4A, C7E, C8E) and via former BNSF (C1T, C2T)	West Tributary to Kelsey Creek, Goff Creek, and Valley Creek	Elevated structure earthwork in watersheds; elevated crossings at West Tributary.	Minimal potential for water quality degradation from runoff of sediment and pollutants at the West Tributary, Goff Creek and Valley Creek.	Impacts on stream buffer on West Tributary.
Segment E				
*Preferred Marymoor Alternative (E2),*including E2 - Redmond Transit Center Station Design Option	Sammamish River, Bear Creek	Elevated and at-grade construction in watersheds; elevated crossings at the Sammamish River and Bear Creek.	Minimal potential water quality degradation from runoff of sediment and pollutants.	Impacts on stream buffer at Sammamish River and Bear Creek crossings.
Redmond Way Alternative (E1)	Sammamish River, Bear Creek	Same as *Preferred Alternative E2.*	Same as *Preferred Alternative E2.*	Same as *Preferred Alternative E2.*
Leary Way Alternative (E4)	Sammamish River, Bear Creek	Same as *Preferred Alternative E2.*	Same as *Preferred Alternative E2.*	Same as *Preferred Alternative E2.*
Maintenance Facilities				
116th Maintenance Facility (MF1)	West Tributary	Earthwork in watershed.	Negligible potential for water quality degradation from runoff of sediment and pollutants.	Few, but potential impacts from hazardous materials spills from facility. New PGIS[a] inputs.
BNSF Maintenance Facility (MF2)	West Tributary	Earthwork in watershed.	Negligible potential for water quality degradation from runoff of sediment and pollutants.	Few, but potential impacts from hazardous materials spills from facility. New PGIS[a] inputs.
SR 520 Maintenance Facility (MF3)	Goff Creek	Two culverts replaced by two shorter culverts and channel restoration.	Moderate potential for water quality degradation from runoff of sediment.	Gain of 42 feet of new channel function. Low, but potential impacts from hazardous materials spills from facility. New PGIS[a] inputs.
SE Redmond Maintenance Facility (MF5)	Bear Creek	Earthwork in watershed.	Negligible potential for water quality degradation from runoff of sediment and pollutants.	Few, but potential impacts from hazardous materials spills from facility. New PGIS[a] inputs.

[a] PGIS = pollutant-generating impervious surface

Pollutant Spills

Anywhere heavy equipment is fueled or hydraulic systems are used during construction, fuel or hydraulic fluid has the potential to be spilled. Even though a spill prevention plan would be implemented, there is still a small potential that some of this material could be carried by stormwater and enter a stream. Because stormwater throughout a watershed ends up in a stream, stormwater entering a storm drain far from a stream is eventually carried to it. Spill prevention BMPs are designed to avoid or minimize construction-related pollutants from entering streams; however, despite precautions, there would still be a small potential.

4.1.1.2 Permanent Operational Impacts

The light rail system would not be pollution-generating; however, overall, the project would increase the amount of impervious surface area in the study area, and impervious surfaces can, without mitigation measures, increase stormwater runoff rates, volumes, and pollutant loads. These, in turn, can cause higher flows and degrade water quality in streams. However, the project would provide stormwater detention to a level that mimics pristine forested conditions. As a result, flows are not expected to increase in any of the streams in the study area as a result of this project. Project impervious areas include new tracks and guideways, stations, park-and-ride lots, maintenance facilities, and roads. Relocated roads to accommodate the project were also counted as project-associated impervious area. In general, elevated alternatives would result in less new impervious area than at-grade alternatives because they would retain the pervious ground underneath them for the most part. Tunnel alternatives do not add impervious area. Project-related parking lots and road realignments are subject to motor vehicle traffic and are considered to be pollution-generating impervious surfaces (PGIS). The guideway and stations would not be subject to motor vehicle traffic or other sources of potential pollution (except at crossing locations) and are therefore classified as non-PGIS.

The project would essentially retrofit most or all of any roadway that is widened to accommodate the at-grade trackways. Although the light rail system would not cause an increase in pollutant loads, stormwater from roadways relocated as a result of at-grade trackway would be treated as well as other project-related PGIS areas, such as the maintenance facility. Project-related stormwater would receive one of two levels of treatment: basic or enhanced. Basic stormwater treatment removes at least 80 percent of suspended solids, and enhanced treatment removes heavy metals that are toxic to fish and aquatic invertebrates. Basic and enhanced treatments reduce but do not eliminate heavy metal and hydrocarbon contaminants in stormwater.

Stormwater from project-related PGIS would receive at least basic stormwater treatment. The maintenance facility and roadways with traffic volumes greater than 7,500 average daily vehicle trips would receive enhanced treatment. High-traffic street intersections would receive treatment to remove oil. None of the alternatives would substantially degrade water quality compared to existing conditions. The project would result in a reduction of 51.7 acres of PGIS. Much of this reduction would be due to shifting vehicle traffic to the non-HOV lanes of I-90. WSDOT would add stormwater treatment facilities to I-90 to accommodate the new pollutant loading associated with the shift in vehicular traffic. With updated stormwater treatment, retrofitted treatment of existing untreated surfaces, and reduction of PGIS, water quality could improve slightly.

Another more general and nonquantifiable aspect is the nature of the project itself. The light rail system would reduce traffic volume in the study area by an estimated 200,000 vehicle miles per year, thus reducing pollutant inputs associated with motor vehicles. All these factors would more than offset the new PGIS, which include the new park-and-ride lot facilities, other minor parking lots, and the maintenance facility.

Sound Transit's preliminary engineering for the East Link Project includes development of a conceptual layout for major stormwater facilities that are sized to comply with the Ecology's Stormwater Manual. These facilities include stormwater ponds and underground vaults. Additional measures to reduce stormwater runoff, such as low-impact development or other on-site measures would be considered at a more advanced phase of project development.

Peak stream flows would not increase because the stormwater systems built for the project would be designed to simulate predevelopment hydrology. Impervious surfaces, however, preclude natural infiltration of precipitation into the ground and result in less groundwater recharge. There is no practical means for compensating for this loss of infiltration. Less precipitation entering the groundwater aquifers might decrease dry-season base flows by decreasing water inputs to streams from groundwater sources such as springs. Dry-season base flows have been identified as one of the most important natural limiting factors controlling salmonid production in lowland Puget Sound streams.

The less impervious surface an alternative has, the less impact it would be likely to have on base flows in a given watershed. Thus alternatives with tunnels or elevated tracks would likely have less impact on base flows. Alternatives with at-grade tracks and/or road widening would have more impact. Comparisons of impervious surface areas between alternatives are made in Section 4.9, Water Resources, of the Final EIS. The worst-case alternative impact would, however, have only a small impact at a basin-wide level due to the small proportion of the watershed affected by the project relative to the existing impervious surfaces within the watershed.

Permanent impacts would also occur when stream channels are either enclosed within new or lengthened culverts, or where riparian vegetation under elevated guideways might be within the "rain shadow" or have low vertical clearance (less than 15 feet). It is assumed that shading impacts cover an area represented by the surface area of an overhead structure 30 feet wide extending over riparian vegetation. Generally, the higher an elevated guideway is off the ground, the less impact it would have on the vegetation below it.

4.1.2 Specific Impacts of Alternatives in Each Segment

4.1.2.1 Fish and Aquatic Species and Habitats

High-value habitats in Washington include all lakes, ponds, streams, and rivers. Special-status species include all salmonids, which are the focus of the analysis described above.

Temporary Construction Impacts

The following discussion of potential impacts is segment- and alternative-specific. Potential impacts common to most or all project alternatives (which are covered above) are not listed or discussed below.

Segment A

Preferred Interstate 90 Alternative (A1)

In Segment A, light rail would be installed on existing road and interstate highway surfaces. The only water body potentially affected would be Lake Washington. There could be a small, temporary direct impact from concrete dust entering Lake Washington while modifying the bridge to accommodate the rail. BMPs such as containment booms and other measure should provide adequate protection.

Sound Transit would need to implement special seismic upgrades to the I-90 floating bridge and I-90 East Channel bridge during the construction period. The seismic upgrades would be in the form of steel jackets installed around the perimeter of the support columns. They would extend from the top of the columns to the top of the footings. The steel jacket sections would be lowered into position by a crane and either bolted or welded together. On the west side of Mercer Island, the support columns of the two non-floating bridge sections (highrises) have footings at or within 1 foot of the water surface of the lake. The East Channel bridge has footings at the bottom of the lake. Divers would fasten the jacket sections on the East Channel bridge on the underwater portion of the columns. This in-water work would need to be conducted during the in-water work window from July 16 to July 31 and from November 16 to December 31. The work window for the floating bridge and its east and west highrises is from July 16 through December 31. Construction activities in this segment would have a very low potential to result in impacts on ESA-listed fish and should not impede the construction schedule. There would be no temporary indirect impacts.

Segment B

Preferred 112th SE Modified Alternative (B2M) to Preferred Alternative C11A

The *Preferred Alternative B2M to C11A* is similar to *Preferred Alternative B2M to C9T* but would be set farther away from Mercer Slough. Thus the linear distance of stream buffer clearing would less, at 1,600 linear feet. The route does not get as close to the water's edge as described for *Preferred Alternative B2M to C9T. Preferred Alternative B2M to C11A* would not have any direct temporary impacts on Mercer Slough West or Sturtevant Creek, but it could result in indirect temporary impacts from vegetation clearing.

Preferred 112th SE Modified Alternative (B2M) to Preferred Alternative C9T

*Preferred Alternative B2M to C9T*would have no direct temporary impacts on fish and aquatic species and habitats but it could have some indirect temporary impacts. *Preferred Alternative B2M to C9T* would be closer to the western part of Mercer Slough than most of the other alternatives, and thus would have a higher risk than most of adding sediment to the slough compared with the other alternatives in Segment B. There would be approximately

1,860 linear feet of vegetation-clearing within the 100-foot-wide stream buffer of the slough (Table 4-2). At one location (the Mercer Slough alcove near SE 15th Street) the vegetation would be cleared to the water's edge. Sound Transit would replant approximately 0.5 acre with native riparian vegetation. With BMPs, the short-term temporary impact on the slough should be minimal. Long-term temporary impacts during the tree grow-out period would also be minimal because few riparian trees would be cut, while many would be planted to replace the abundant blackberries that currently form most of the riparian stream buffer.

TABLE 4-2
Potential Temporary Construction Impacts on Stream Buffers along Mercer Slough West or Mercer Slough

Alternative	Stream Buffer Impact Area of Clearing (acre) [a]	Linear Feet of Clearing within the Stream Buffer during Construction
Preferred 112th SE Modified Alternative (B2M)		
to Preferred Alternative C11A	1.2	1,680
to Preferred Alternative C9T[b]	1.0	2,100
Bellevue Way Alternative (B1)	0	0
112th SE At-Grade Alternative (B2A)	0.5	1,380
112th SE Elevated Alternative (B2E)	0.7	1,580
112th SE Bypass Alternative (B3)	0.5	1,260
B3 - 114th Extension Design Option	1.3	1,970
BNSF Alternative (B7)	0.3	300

[a] Some of the impacts on stream buffers overlap with impacts on some wetland buffers. Refer to Table 4-9 and Appendix F.
[b] Impacts for C9T - East Main Station Design Option would not vary from those of *Preferred Alternative C9T*.

Bellevue Way Alternative (B1)

This alternative would not have any direct temporary impacts on fish and aquatic species and habitats. This alternative would have the least temporary indirect impacts of any of the South Bellevue (Segment B) alternatives because construction would not occur near water. The one area where Alternative B1 is somewhat near water (at the ramp off of I-90) is isolated by another freeway ramp embankment.

112th SE At-Grade (B2A) and 112th SE Bypass (B3) Alternatives

Alternatives B2A and B3 would not have any direct temporary impacts but could have indirect temporary impacts on fish and aquatic species and habitats. The potential impact of these alternatives would be intermediate among the Segment B alternatives impacts because the section running along 112th Avenue SE would be in the middle of the roadway, while Alternatives B2E and B3, and *Preferred Alternative B2M* would be closer to the water. While 112th Avenue SE would still have to be widened, it would be to both the east and west as opposed to the construction limit being entirely on the east side of 112th Avenue SE. Alternative B2A would clear 1,330 linear feet of stream buffer, and Alternative B3 would clear 1,280 linear feet.

112th SE Elevated (B2E) Alternative

Alternative B2E would not have any direct temporary impacts on fish and aquatic species and habitats. This alternative could, however, have indirect temporary impacts from being entirely elevated, thus having more earthwork than alternatives with more at-grade construction such as Alternatives B1 and B2A. The section with the highest sedimentation risk would be the area close to Mercer Slough along 112th Avenue SE. Approximately 1,540 linear feet of stream buffer would be cleared and replanted. Appropriate BMPs would be implemented to reduce this risk, so short-term construction impacts should be minimal.

B3 - 114th Extension Design Option

This design option is similar to Alternative B3 except that instead of crossing the Sturtevant Creek wetland, the route curves east just north of SE 15th Street, thereby avoiding the wetland, but instead requires an additional elevated crossing of Sturtevant Creek on the south side of SE 8th Street. Assuming that the light rail would cross Sturtevant Creek with a free-spanning guideway structure with the support column borings located outside of the ordinary high water mark (OHWM), impacts would be minimal on aquatic resources. Construction would, however, be close to the water and would damage existing vegetation within the riparian stream buffer and pose a moderate sedimentation risk to Sturtevant Creek. This alternative is routed closer to Mercer Slough than most alternatives, and would result in 1,770 linear feet of vegetation being cleared within the stream buffer.

BNSF Alternative (B7)
Alternative B7 would not have any direct temporary impacts on fish and aquatic species and habitats. It could result in indirect temporary impacts. Alternative B7 would cross over the mouth of Mercer Slough as an elevated structure. Assuming the slough would be crossed with a free-spanning structure with the support column borings located outside of the OHWM, impacts would be minimal on aquatic ecosystems. Construction would, however, be close to the water and damage riparian vegetation as well as still pose a moderate sedimentation risk to Mercer Slough. A temporary work trestle might be constructed over Mercer Slough to accommodate construction, and a 100-foot-wide corridor would be cleared of vegetation for 240 linear feet of stream buffer. Implementation of appropriate BMPs to isolate the work area would largely avoid impacts. The elevated guideway would cross a portion of Kelsey Creek contained within a culvert, but no impacts on the creek are expected.

Segment C

Preferred 108th NE At-Grade Alternative (C11A) and Preferred 110th NE Tunnel Alternative (C9T), both from Preferred Alternative B2M
Preferred Alternatives C11A and *C9T* from *Preferred Alternative B2M* would connect to the Hospital Station, which would be located on top of the existing Sturtevant Creek channel just north of NE 8th Street. The channel would be relocated to the west side of the station with a fish-passable culvert under the former BNSF Railway tracks for about 300 feet. The new channel would release a short pulse of suspended sediment when the stream flow is reintroduced into the channel. This would be a minor impact on fish and aquatic species and habitats because the flow would be very low at the time of year this action would occur. The route also crosses Sturtevant Creek just south of the NE 8th Street/ I-405 interchange. A bridge column would be placed in the location where the pipe makes a sharp turn. The pipe would be relocated out of the way, resulting in a shorter length. The construction sequence and time of year this would be done makes it highly unlikely that this would result in sediment input to Sturtevant Creek. Impacts would not be different with the C9T - East Main Station Design Option because there are no lakes, ponds, streams, or rivers in the construction area associated with this station.

Preferred Alternatives C11A and C9T from Alternative B3
In addition to the potential impact described above at the Hospital Station, these alternatives have a section of elevated guideway that would run close to Sturtevant Creek adjacent to the Bellevue Hilton Hotel. In this short reach of Sturtevant Creek, the guideway would cross the creek twice and run parallel to it for about 420 linear feet. All of the existing, mostly native riparian trees would be removed in this reach during construction and replanted with suitable native riparian vegetation after construction, resulting in a temporary loss of riparian functions such as shade, nutrient inputs from leaf litter and terrestrial insects. Normally these functions would also include LWD recruitment, which would add the habitat complexity and provide in-stream cover. At present, LWD recruitment is precluded due to maintenance activity by the hotel. If a tree falls, it would be cut up and hauled away. This reach is the only productive spawning and rearing habitat in Sturtevant Creek that is accessible to anadromous salmonids due to the presence of gravel, cobble, and pools.

Based on the current preliminary design, there would be no in-water work with this alternative. Three columns would be placed within 15 feet of the stream channel OHWM, and a fourth column within approximately 30 feet of the OHWM. The construction area would be as close as 5 feet to the channel. Although the sedimentation risk would be high, Sound Transit would implement strict BMP measures. If the contractor is careful, they could construct the guideway without directly affecting the channel.

Preferred Alternatives C11A or *C9T* from B3 – 114th Design Option or Alternative B7 would have potential impacts identical to the one described above but would add approximately 300 feet of construction close to the stream channel in the reach just downstream of the Hilton Hotel. This reach would also be cleared of riparian vegetation prior to construction and replanted with suitable vegetation after construction. The potential for sedimentation is high at this location due to steep slopes but should be able to be contained with BMPs as described above.

Bellevue Way Tunnel Alternative (C1T)
Alternative C1T would avoid potential impacts on fish and aquatic species and habitats in Sturtevant Creek in the vicinity of the Hilton Hotel and downstream but have the temporary pulse of sediment at the Hospital Station as described above for *Preferred Alternatives C11A* and *C9T*.

106th NE Tunnel (C2T), 110th Avenue NE At-Grade (C9A), and 114th NE Elevated (C14E) Alternatives
Alternatives C2T, C9A, and C14E would have the same potential impacts as described for *Preferred Alternatives C11A* and *C9T* and their various connectors to Segment B with one exception: Alternative C14E does not have an alternate connection to Alternatives B2A or B2E and thus does not avoid the Hilton Hotel reach.

108th NE Tunnel (C3T), At-Grade Couplet (C4A), and 110th NE Elevated (C8E) Alternatives
Except for two differences, Alternatives C3T, C4A, and C8E would have the same potential impacts on Sturtevant Creek as *Preferred Alternatives C11A* and *C9T* with their various Segment B connectors in the vicinity of the Hilton Hotel and downstream. These alternatives would bypass the Hospital Station, and with connections from Alternatives B2A and B2E, these alternatives bypass Sturtevant Creek altogether.

112th SE Elevated Alternative (C7E)
Alternative C7E would have no potential impacts on aquatic habitats under any condition.

Segment D
Preferred NE 16th At-Grade Alternative (D2A)
Preferred Alternative D2A would cross the West Tributary to Kelsey Creek as an elevated guideway where the stream is impounded by a regional stormwater detention facility. Direct temporary impacts on fish and aquatic species and habitats would occur as a result of in-water construction. Up to five support columns would be placed within the OHWM. Sediment transport and turbidity would be contained within cofferdams or an equivalent, which Sound Transit would remove after construction and when the suspended sediment has settled. The ponded water currently extends downstream for approximately 500 feet. While the sedimentation risk is high, the impacts are likely to be minimal as long as the appropriate BMPs are implemented.

Indirect temporary impacts would occur from vegetation clearing within the stream buffer. Approximately 450 linear feet of riparian vegetation would be cleared and replanted. Sedimentation risk would be moderate to high because some of the areas that would be cleared are steep embankment slopes. Only minimal impacts are expected, however, because the adjacent waters are ponded and still.

The *Preferred Alternative D2A* route crosses Goff Creek at a point where the creek runs through a long pipe system; therefore, Sound Transit expects no stream impacts at this location. Sound Transit would construct a three-sided box culvert over the piped section of Goff Creek at the crossing. The purpose of this action would be to allow a fish-friendly crossing to be created if the City of Bellevue's plan to daylight this section of Goff Creek is realized.

The *Preferred Alternative D2A* route crosses the Unnamed Tributary to Kelsey Creek at-grade along 136th Place NE just south of NE 20th Street. There could be a direct temporary impact due to in-channel work. Sound Transit would lengthen the street culvert by 130 feet to accommodate both 136th Place NE and the guideway. Some sediment release could likely occur as a result. However, during the in-water construction window, the creek would have almost no flow, and sediment containment BMPs would likely limit sediment transport to a minimal amount. This stream is not known to support salmonids. There would not be any indirect impacts because the rest of the work area is paved.

Preferred Alternative D2A would cross Valley Creek by elevated guideway with no direct impacts. The southern edge of the guideway would be about 20 feet north of the SR 520 culvert outlet, and the rest of the guideway crosses over the culvert on the embankment of SR 520. Sedimentation risk is moderate to high at this location because construction would occur on a steep slope directly adjacent to the stream channel, except it is unlikely that a support column would be placed close to the culvert due to the position of the culvert to the NE 140th Street bridge. Sound Transit would implement BMPs commensurate to the risk, thereby resulting in minimal impacts. Some riparian trees (willow) might be removed, but Sound Transit would replace the trees with the same species after construction.

The potential impacts under the D2A - NE 24th and 120th Station Design Options would be identical to those described for *Preferred Alternative D2A.*

None of the Segment D connection options from Segment C would have differentiable impacts between the alternatives and are thus not discussed below. Construction over streams might affect suitable western toad habitat; these streams are the West Tributary to Kelsey Creek (with *Preferred Alternative D2A* and Alternatives D2E, D3, and D5), and Valley Creek (with *Preferred Alternative D2A* and Alternatives D2E and D5).

NE 16th Elevated Alternative (D2E)
Alternative D2E would have similar impacts on fish and aquatic species and habitats at the Goff Creek and Valley Creek crossings as *Preferred Alternative D2A*. At the West Tributary to Kelsey Creek crossing, Alternative D2E crosses as an elevated guideway at a location south of where *Preferred Alternative D2A* would cross, where the riparian area and channel are relatively narrow. As a result, the impacts would be less. Seventy linear feet of riparian trees would be cleared then replanted after construction. Support column construction could be well away from the water; therefore, potential sedimentation would be minimal. The potential impacts of Alternative D2E would be the same as with *Preferred Alternative D2A* at the Unnamed Tributary to Kelsey Creek.

NE 20th Alternative (D3)
Alternative D3 would have impacts on fish and aquatic species and habitats similar to Alternative D2E at the West Tributary to Kelsey Creek and Goff Creek crossings. Alternative D3 would result in direct temporary impacts on Valley Creek due to in-water work. The channel would be crossed at-grade and would require adding approximately 30 feet of length to the existing culvert under NE 20th Street and replacing the existing culvert with a new, lower, and wider profile. The reason for the new culvert design is that this alternative is a retained cut at the Valley Creek crossing. There would likely be a small pulse of sediment released even with the full implementation of BMPs. The amount would be small and temporary in nature. Valley Creek has anadromous salmonid access to this point and above. The reach potentially affected was rated as good during the habitat survey. Alternative D3 would also cross Sears Creek where the creek is in a long culvert under NE 20th Street. Despite the fact that the route is a retained cut at this location, the culvert is deep enough that the project would not affect it.

SR 520 Alternative (D5)
Alternative D5 would have the same potential impacts as *Preferred Alternative D2A* at Valley Creek. It would cross the West Tributary to Kelsey Creek in a different location but would have similar impacts as described above for Alternatives D2E and D3. It would cross Goff Creek just north of the SR 520 culvert outlet. The potential for sedimentation is moderate because the slope above the culvert is steep. However, there is little woody vegetation to clear upslope, and columns would have to be placed to either side, thus making BMPs effective to contain potential sediment from entering the channel.

Segment E

Preferred Marymoor Alternative (E2)
Preferred Alternative E2 would cross the Sammamish River as an elevated guideway next to the SR 520 bridge. Large-volume earthwork, such as retained fill or retained cut activities, would occur at least 500 feet from the river. Support columns would be placed no closer than the top of the riverbank, which is outside of the OHWM. On this flat ground, the erosion sedimentation risk is low. It is assumed that a 100-foot-wide corridor through the existing riparian vegetation (dominated by blackberry and a few small conifer trees) would be cleared within the stream buffer of the Sammamish River to construct the elevated cast-in-place guideway.

Preferred Alternative E2 would cross Bear Creek as an elevated guideway. No in-water work would be necessary. The ground is flat on either side of the crossing; therefore, the sedimentation risk during construction would be low. No riparian vegetation would need to be cleared, and construction impacts should be minimal.

Potential impacts under the E2 - Redmond Transit Center Station Design Option would be identical to those described for *Preferred Alternative E2*.

Redmond Way Alternative (E1)
Alternative E1 would cross the Sammamish River on a new bridge. The river is narrow enough to be spanned with the support columns outside of the OHWM. Alternative E1 would cross Bear Creek on a new bridge that would be wider than the existing railroad bridge. No in-water work would be necessary at either crossing. Both crossings would have the same potential impacts on fish and aquatic species and habitats as *Preferred Alternative E2*.

Leary Way Alternative (E4)
Alternative E4 would cross the Sammamish River on a new bridge next to the Leary Way bridge. The river is narrow enough to be spanned with the support columns outside of the OHWM. No in-water work would be necessary at either crossing. Both crossings would have the same potential impacts as *Preferred Alternative E2*.

Maintenance Facility

116th Maintenance Facility (MF1)

MF1 would be sited in a commercial district well away from the nearest water body. The sedimentation risk would be low because the receiving water (i.e., the upper reaches of the West Tributary to Kelsey Creek) is well away from construction activities and the creek in that area is a series of beaver ponds that would detain and deposit sediment inputs. No riparian vegetation would be disturbed.

BNSF Maintenance Facility (MF2)

Construction impacts on fish and aquatic species and habitats from the MF2 would be similar to those described for MF1.

SR 520 Maintenance Facility (MF3)

The footprint of MF3 would surround approximately 370 feet of the existing Goff Creek channel. There would be direct temporary impacts on fish and aquatic species and habitats due to in-water work. A 56-foot-long culvert would be removed and replaced with a 19-foot-long culvert. In addition, a 43-foot-long culvert would be replaced with two 19-foot-long culverts. The result would be an increase in fish habitat of 42 feet of channel. There would be some sedimentation risk to the channel as a result of in-stream work. No riparian vegetation other than mowed grass and English ivy is present in this reach. Impacts to the Unnamed Tributary to Kelsey Creek would be similar to that described for *Preferred Alternative D2A*.

SE Redmond Maintenance Facility (MF5)

MF5 would be placed on the opposite side of SR 520 from Bear Creek. Stormwater from the facility drains to the Sammamish River some distance away, thus minimizing sediment delivery to the river. Bear Creek would be unaffected.

Permanent Operational Impacts

Segment A

Preferred Interstate 90 Alternative (A1)

Because electrically powered light rail systems do not generate any pollutants, stormwater—from both water volume and water quality perspectives—is not an issue for the East Link Project. Operation of rail could discharge stray electrical current into Lake Washington and create electric current fields around the bridge, in addition to fields that would be already possibly created from the bridge's existing cathodic corrosion protection system. Sound Transit estimates that stray current intensity would be one to three orders of magnitude below physiological or behavioral response thresholds for even the most sensitive Lake Washington fish species (see Appendix G). No permanent operational impacts on fish and aquatic species and habitats are expected as a result of *Preferred Alternative A1*.

Segment B

Preferred 112th SE Modified Alternative B2M to Preferred Alternative C11A

Preferred Alternative B2M to C11A would have a small, direct permanent impact on aquatic habitat. It would require the installation of a short bridge over a small, narrow alcove in the shoreline of Mercer Slough West in the vicinity of SE 15th Street. This would cover and shade approximately 18 square feet of water. Permanent indirect impacts would occur due to loss of vegetation within the stream buffer of Mercer Slough West along 112th Avenue SE, north of Bellevue Way (0.4 acre [Table 4-3]). The vegetation in the buffer that would be affected is low-quality habitat because it is dominated by Himalayan blackberry (a state-listed noxious weed) and mowed lawn (see Exhibit 4-1), with few native trees or shrubs. The proposed at-grade footprint (south of SE 15th Street) would permanently affect an approximately 30-foot-wide area of this buffer that ranges in width by approximately 50 to 200 feet. However, the area of construction clearing would be replaced with much higher quality vegetation. At this location there is an opportunity to remove low-quality riparian vegetation (mostly blackberries) and replace it with high-quality,

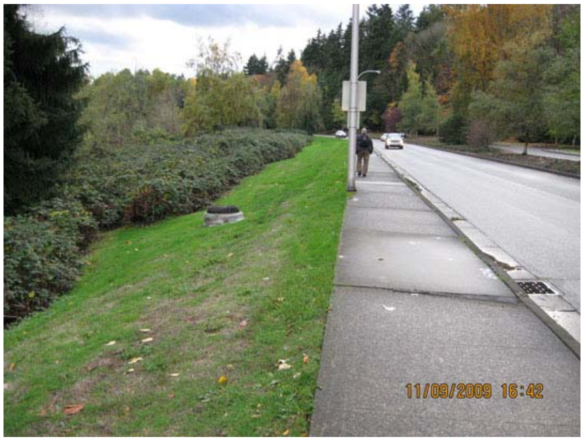

EXHIBIT 4-1
Mercer Slough buffer along 112th Avenue SE

native woody riparian vegetation, including conifer species that could shade the water as the trees grow, nutrient inputs to the slough from leaf litter and terrestrial insect inputs, pollutant removal, and erosion control. The Bellevue Parks Department has developed a restoration plan to remove the blackberry and restore this buffer area with native trees and shrubs. Implementing this design to restore the buffer area could mitigate for the permanent (and any temporary) buffer impacts on fish and aquatic species and habitats and result in high-quality buffer habitat that would benefit Mercer Slough.

Preferred 112th SE Modified Alternative (B2M) to Preferred Alternative C9T

Preferred Alternative B2M to C9T would have similar impacts as those described for *Preferred Alternative B2M to C11A* except that more stream buffer would be lost (0.9 acre).

TABLE 4-3
Potential Permanent Operational Impacts on Stream Buffers at Mercer Slough West or Mercer Slough

Alternative	Stream Buffer Impact Area[a] (acre)
Preferred Alternative B2M	
to C11A	0.4
to C9T[b]	1.1
Bellevue Avenue Alternative (B1)	0
112th SE At-Grade Alternative (B2A)	0.1
112th SE Elevated Alternative (B2E)	0.4
112th SE Bypass Alternative (B3)	0.1
B3 - 114th Extension Design Option	0.3
BNSF Alternative (B7)	0.2

[a] Some of the impacts on stream buffers overlap with impacts on some wetland buffers. See Table 4-10 later in this section and Appendix F.
[b] Impacts for C9T - East Main Station Design Option would not vary from those of *Preferred Alternative C9T*.

Bellevue Way Alternative (B1)

Alternative B1 should have no permanent operational impacts on fish and aquatic species and habitats.

112th SE Bypass (B3) and 112th SE At-Grade (B2A) Alternatives

Alternatives B2A and B3 would have no direct permanent impacts on fish and aquatic species and habitats. Indirect permanent impacts would occur due to the increased existing encroachment of 112th Avenue SE into the Bellevue's 100-foot CAO stream buffer along Mercer Slough (0.1 acre each) between Bellevue Way SE and SE 8th Street. This area has few trees and is almost entirely Himalayan blackberries. The impacts would be the same as described for *Preferred Alternative B2M to C11A* but less so in proportion to the acreage involved. The B3 - 114th Extension Design Option would have no direct permanent impacts on fish and aquatic species and habitats. Indirect permanent impacts would occur due to stream buffer loss from the guideway footprint. This loss (1.3 acres) would be the greatest of all the Segment B alternatives. Otherwise, impacts would be similar to *Preferred Alternative B2M to C11A*. The difference in stream buffer loss is due to the curve near the intersection of 112th Avenue SE and SE 8th Street.

112th SE Elevated Alternative (B2E)

The elevated track section along 112th Avenue SE would have no direct permanent impacts on fish and aquatic species and habitats. Indirect impacts from loss of stream buffer would be an improvement due to the replanting plan described for *Preferred Alternative B2M to C11A*. While the guideway might cast shade on the riparian vegetation bordering Mercer Slough, the height of the guideway (approximately 25 feet) would allow enough light for normal tree growth as found along the elevated guideways in Sound Transit's Central Link. The permanent loss of stream buffer would be 0.4 acre. The impact would be more than offset by the improvements made from replanting with native riparian vegetation.

BNSF Alternative (B7)
The elevated track section crossing Mercer Slough would have no direct permanent impacts on fish and aquatic species and habitats**.** While some shade would be cast on the adjacent riparian vegetation, the height of the guideway (65 feet) would allow enough light for normal tree growth. There would be a permanent loss of riparian vegetation in the footprint of two support columns (200 square feet). A loss of riparian function would occur where riparian vegetation would be cleared and replanted (0.2 acre). This area is composed of willow trees and would be replanted with the same. The trees could grow back to the present condition in approximately 10 years.

Segment C
Preferred 108th NE At-Grade Alternative (C11A) and Preferred 110th NE Tunnel Alternative (C9T), from B2M
With *Preferred Alternatives C11A* or *C9T*, the Hospital Station would be positioned over the top of the existing Sturtevant Creek channel just north of NE 8th Street. To minimize impacts on the creek, the channel would be shifted to the west side of the former BNSF Railway tracks in a new culvert, thereby realigning the channel to the west approximately 30 feet into a landscaped strip next to the station. This reach is approximately 300 feet long. The new channel would be a substantial improvement compared to the existing channel, which is straight, featureless, and lacking any riparian vegetation. The new channel would have riparian vegetative cover, a gravel streambed, and a more natural form. The riparian area would also provide nutrient inputs from leaf litter and insects. However, salmonid presence in this reach is uncertain because the reach is above several fish-passage blockages.

Preferred Alternatives C11A and *C9T* from Alternative B3 pass through the Hilton Hotel reach, running along Sturtevant Creek for 420 feet adjacent to the hotel and crossing the channel twice. The existing vegetation along this stream reach, which is a mixture of mature conifer and deciduous trees, would be cleared during construction and replanted with short-growing native species, such as Sitka willow and vine maple. About 150 feet of channel is below the guideway and the rest is adjacent to it. The elevated guideway would be approximately 45 feet above the ground and not effectively shade this riparian area. There would be a temporal loss of riparian function while the new riparian trees re-establish. Because Sound Transit would not alter the creek channel, it would still provide spawning habitat. Even though the riparian trees would be smaller, LWD recruitment potential would not be diminished because this area is an intensively managed landscape. Fallen trees would be removed by hotel landscaping contractors either way.

Preferred Alternatives C11A or *C9T* from the B3 – 114th Extension Design Option or Alternative B7 would have the same impacts as described in the prior paragraph but would add approximately 300 feet of clearing within 20 feet of the stream channel to that described for the connection to Alternative B3, 140 feet of clearing to the water’s edge, and 130 feet of guideway approximately 25 feet off the ground above the channel. Potential impacts on riparian function would be the same as described above for this additional reach, except that landscaping is not actively managed to the water’s edge as it is on the Hilton Hotel property. Because there are no ponds, streams, or rivers in the area of the C9T- East Main Station Design Option, no additional impacts would occur if this option is selected.

Bellevue Way Tunnel Alternative (C1T)
Alternative C1T would avoid potential impacts on fish and aquatic species and habitats in Sturtevant Creek in the vicinity of the Hilton Hotel and immediately downstream. But this alternative would result in the same potential improvements on Sturtevant Creek at the Hospital Station as described above for *Preferred Alternative C11A*.

106th NE Tunnel Alternative (C2T) and 110th NE At-Grade Alternative (C9A)
Alternatives C2T and C9A would have the same potential impacts on fish and aquatic habitat as described for *Preferred Alternatives C11A* and *C9T* connecting to *Preferred Alternatives B2M*. Impacts from Alternatives C2T or C9A connecting to Alternatives B3, B3 – 114th Extension Design Option (with C9A only), or B7 would be similar to that described for *Preferred Alternatives C11A* and *C9T*, except that the guideway would be lower with Alternative C2T and thus cast a shadow on the channel that would likely result in a minor reduction of primary productivity in the reach adjacent to the Hilton Hotel. Approximately 140 linear feet of channel would be under the guideway with an elevation of 15 to 16 feet.

108th NE Tunnel (C3T), At-Grade Couplet (C4A), and 112th SE Elevated (C7E) Alternatives
Alternatives C3T, C4A, and C7E connecting to Alternatives B2E or B2A would avoid aquatic impacts in Segment C entirely. These alternatives when connected to Alternatives B3 or B7 would have the same potential impacts on

fish and aquatic species and habitats in Sturtevant Creek in the vicinity of the Hilton Hotel and immediately downstream as *Preferred Alternatives C11A* and *C9T* connecting to their various Segment B connectors.

110th NE Elevated Alternative (C8E)
This alternative would have potential impacts in the vicinity of the Hilton Hotel similar to those described for *Preferred Alternatives C11A* and *C9T* with connections to B3 or B7.

114th Avenue NE Elevated Alternative (C14E)
This alternative would have potential impacts at the Hospital Station similar to those described for *Preferred Alternatives C11A* and *C9T*. It would have potential impacts in the vicinity of the Hilton Hotel similar to those described for *Preferred Alternatives C11A* and *C9T* connecting to B3, B3 – 114th Design Option, and B7.

Segment D

Preferred NE 16th At-Grade Alternative (D2A)
Preferred Alternative D2A would have a negligible, direct permanent impact on fish and aquatic species and habitats in the West Tributary to Kelsey Creek caused by the placement of approximately five support columns (500 square feet) in the regional stormwater detention pond. The pond does not support salmonids because there are numerous passage blocks downstream and no spawning areas above. This area is artificially flooded for the stormwater detention facility and sometimes is dry. There would be a small, indirect permanent reduction of riparian function where it crosses the West Tributary to Kelsey Creek in a 0.2-acre area. Large trees would be removed and replaced with shorter growing trees and other understory vegetation. There would be a temporal loss of riparian function as well. The new vegetation would likely grow well because shading would be minimal from the guideway, and it would be north of most of the affected riparian vegetation. The loss of shade on the pond from the taller trees would likely be offset by the shadow of the elevated guideway.

During operation of *Preferred Alternative D2A*, there would be no permanent impacts on Goff Creek.

There would be a negligible, direct permanent impact on the Unnamed Tributary to Kelsey Creek from culvert lengthening (130 feet). The existing stream channel is basically a roadside ditch with no riparian vegetation other than grasses. This tributary currently cannot support salmonids because it has no spawning habitat and has an impassable blockage at its confluence with Kelsey Creek.

At Valley Creek, *Preferred Alternative D2A* would result in no permanent impacts. The southern edge of the guideway would be 27 feet above and about 20 feet to the north of the culvert outlet, and the rest of the guideway would be to the north. As a result, there would be no shadow cast on the stream or riparian vegetation close to the channel and thus no shading impacts.

Both D2A - 120th Station and NE 24th Design Options would have potential impacts identical to those described for *Preferred Alternative D2A*.

NE 16th Elevated Alternative (D2E)
Alternative D2E would have no direct permanent impact on the West Tributary to Kelsey Creek because it would span the creek as an elevated guideway 50 to 60 feet off the ground at this location. Indirect permanent impacts on the stream buffer from this alternative at the West Tributary would be similar to those described for *Preferred Alternative D2A* except that the much less area (0.1 acre) would be involved. Impacts at Goff Creek, the Unnamed Tributary to Kelsey Creek, and Valley Creek would be the same as that described for *Preferred Alternative D2A*.

NE 20th Alternative (D3)
In addition to the impacts described above for Alternative D2E, Alternative D3 would have direct permanent impacts at Valley Creek and NE 20th Street. Valley Creek would lose aquatic habitat and riparian function for the 30 linear feet of channel enclosed in the lengthened culvert at 20th Street. This reach of Valley Creek was rated as good habitat. Sears Creek would be unaffected.

SR 520 Alternative (D5)
Alternative D5 would have impacts from the elevated guideway crossing at the West Tributary to Kelsey Creek similar to those described for Alternative D2E. There would be no impact on aquatic habitat at Goff Creek and Valley Creek. It is assumed that the Unnamed Tributary to Kelsey Creek is currently in a pipe where the elevated guideway would cross; therefore, this alternative would not impact aquatic habitat.

Segment E

Preferred Marymoor Alternative (E2)

Preferred Alternative E2 would have no direct permanent impacts. This alternative would affect riparian vegetation at the Sammamish River crossing. The guideway would be elevated approximately 55 feet over the west bank, 45 feet over the east bank, and 60 feet over the water. Assuming a cast-in-place bridge, the existing riparian vegetation (dominated by blackberry and a few small conifer trees) would be cleared and replanted after construction with shrubs and shorter-growing trees. This would result in a permanent reduction of potential future LWD input to the river. The guideway would be high enough that tree growth would not be hampered by shading from the guideway. There would be a temporal loss of nutrient inputs to the river while the newly planted trees are growing up. With regard to river temperature, the proposed guideway would provide more shade than the few existing small conifer trees and blackberries provide. The Sammamish River is on the State's 303(d) list for water temperature, so temperature concerns are more important than losing primary vegetation productivity from shade at this location.

With *Preferred Alternative E2*, there would be a permanent loss of riparian vegetation functions for approximately 5 feet on either side of the former BNSF Railway bridge over Bear Creek because the guideway would only be 8 feet above the banks with the sun aspect oblique to the guideway. The primary riparian vegetation productivity would be less under the shadow of the guideway, which would be 15 feet above the water surface.

The E2 - Redmond Transit Center Design Option would have the same potential impacts as *Preferred Alternative E2*.

Redmond Way Alternative (E1)

Alternative E1 would have the same impacts as *Preferred Alternative E2* at the Sammamish River crossing except that more (0.2 acre) riparian vegetation would be affected. At the Bear Creek crossing, there would be no impacts on riparian vegetation because the guideway would be 48 feet above the top of the stream bank and 53 feet above the water surface. There are no tall-growing tree species present.

Leary Way Alternative (E4)

Alternative E4 would have the same impacts as *Preferred Alternative E2* at the Sammamish River crossing. Impacts on the riparian community would be similar to but slightly less than *Preferred Alternative E2* at the Bear Creek crossing because the elevated guideway would be 3 feet higher (18 feet above the water surface).

Maintenance Facilities

116th Maintenance Facility (MF1)

MF1 might cause negligible, permanent operational impacts from pollutant loading in the West Tributary to Kelsey Creek.

BNSF Maintenance Facility (MF2)

Impacts with MF2 would be the same as with MF1.

SR 520 Maintenance Facility (MF3)

MF3 would create 42 feet of new fish habitat from culvert replacement in Goff Creek and shortening the length of the culvert. The reach could be improved with the construction of a few pools. The riparian area is currently lacking vegetation other than mowed grass and English ivy; this would be improved with appropriate native vegetation. Pollutant loading impacts would be negligible in Goff Creek.

SE Redmond Maintenance Facility (MF5)

MF5 might cause negligible, permanent operational impacts from minor pollutant loading in the Sammamish River.

4.1.2.2 Federal-Listed Threatened and Endangered Species

The ESA offers protection for three species of fish known to be present in the project vicinity: Puget Sound steelhead, Puget Sound Chinook salmon, and bull trout. NMFS and WDFW have established in-water construction work windows for water bodies that must be adhered to in order to protect ESA species. Table 4-4 shows applicable in-water work windows for these salmonid resources in the project vicinity.

TABLE 4-4
Construction Work Windows for Listed Species

Water Body	Applicable Alternative	ESA Work Window
Lake Washington	Segment A Alternative	July 16 – December 31 (I-90 floating bridge and east and west highrises) July 16 – 31 and November 16 – December 31 (East Channel bridge)
Kelsey Creek watershed and Bear Creek	All Segment C Alternatives	July 1 – August 31
Sammamish River and lower Bear Creek	All Segment D Alternatives	July 16 – July 31 and November 16 – March 15

Although a detailed construction schedule has not been developed yet, the allowable construction work windows should not affect the overall project schedule. The potential impacts apply to the degree that the species or their habitats are found in proximity to project activities. The following text describes the likelihood of exposure and potential impacts of project activities and structures on protected species by project segment.

Segment A

Chinook salmon, steelhead, and bull trout could be exposed to construction activities. However, construction activities in Segment A would have a very low potential for impacts on these fish. In addition, work window restrictions would minimize their exposure to construction activities.

Segment B

Construction activities in Segment B would have a low potential impact on Chinook salmon or steelhead because this segment contains no spawning or primary rearing habitat and because there would be no in-water work.

Segment C

Bull trout are not present in Segment C. Chinook salmon are present in Sturtevant Creek. Steelhead presence is possible. Near-water (but not in-water) work would occur. The appropriate level of BMPs would be implemented to prevent adverse effects on listed species.

Segment D

Potential impacts on Chinook salmon or steelhead occurring in West Tributary Kelsey Creek would be isolated from downstream habitats by long stretches of ponded water. Potential impacts that might occur in Goff Creek would be far enough upstream from areas of Chinook salmon or steelhead use that impacts would be diminished before reaching downstream habitats. Kelsey Creek, the most important Chinook salmon habitat in this segment, is at least 0.25 mile downstream of the closest project construction.

Segment E

Potential impacts on both Chinook salmon and steelhead would be low in the Sammamish River because it is only a migratory corridor and the crossings are elevated structures that would not involve in-water work. The Bear Creek crossing would be the most sensitive project element because it is close to Chinook salmon and steelhead rearing habitat.

4.2 Vegetation and Wildlife

Construction of the East Link Project could have permanent operational and temporary construction impacts on vegetation and wildlife in the study area. These include mostly direct and some potential indirect impacts. The following sections outline the range of potential impacts that could occur for each segment and alternative. Actual impacts would depend on the final alternative selection and design, construction footprint and methods, BMPs implemented during construction, and performance of post-construction wetland restoration.

Vegetation polygons were classified and mapped regardless of size or upland/wetland designation. As a result, the vegetation polygons might include upland and/or wetland vegetation. Vegetation polygons might overlap with wetland polygons; therefore, affected acreage numbers for wetlands and vegetation/wildlife habitat cannot be added together. This overlap is depicted on Exhibits 3-23 to 3-26.

4.2.1 Temporary Construction and Related Impacts

Project construction would require clearing and removal of vegetation from within the construction limits. Affected areas (and associated species) within the construction limits that would be permanently altered by project facilities are addressed under permanent operational impacts in Section 4.2.2. As described in Section 1.4.1.1, the duration of temporary construction impacts would vary depending on the vegetation type and associated habitat functions that would be affected. Impacts associated with disturbance and displacement of wildlife are also described in this section. Alternatives that would result in some level of temporary wildlife displacement are listed in Table 4-5. Alternatives not listed in Table 4-5 would have few or no displacement-related impacts. Impacts on cities' critical areas are noted only in terms of the impacts on high-value habitats that support multiple special-status species. These high-value habitats are described in Section 2.2.2.4.

Construction activities would also temporarily affect wildlife in the general area. Impacts would occur from vegetation and habitat loss, disruption of travel corridors, noise impacts, and displacement of wildlife into potentially less suitable habitats where they might not thrive. Wildlife would likely be displaced when construction begins. Species displaced by construction noise would likely return after construction is complete. However, reestablishing native vegetation would require 2 to 4 years for herbaceous upland and wetland types, and decades for mature forest types. Species that forage on or near the ground, for example, urban-dwelling small mammals or birds such as juncos and song sparrows, would use their preferred habitats first. Species that require mature vegetation, and especially those that use large shrubs and trees, such as wrens, chickadees, and woodpecker, would recolonize their preferred habitats last.

TABLE 4-5
Alternatives with Temporary Wildlife Displacement Expected During Construction

Alternative	Basis for Determination
Alternatives with Relatively Higher Expected Levels of Wildlife Displacement	
Preferred 112th SE Modified Alternative (B2M) Bellevue Way Alternative (B1) 112th SE At-Grade Alternative (B2A) 112th SE Elevated Alternative (B2E) 112th SE Bypass Alternative (B3) B3 - 114th Extension Design Option	Location along Bellevue Way (relatively quieter than near I-405 or I-90) and adjacent to Mercer Slough might result in greater increase in noise over existing conditions compared to Alternative B7.
Preferred Alternative B2M Alternative B2E Elevated portion of Alternative B7 Alternative B3 (along SE 8th Street) B3 - 114th Extension Design Option	Elevated structures adjacent to Mercer Slough Nature Park or through Sturtevant Creek wetland mighty result in more noise near high-value wildlife area.
Alternatives with Intermediate Expected Levels of Wildlife Displacement	
Alternative (B7), at-grade along former BNSF Railway corridor	Farther from Mercer Slough Nature Park than other Segment B alternatives and proximity to noisier I-405 and I-90 reduces potential impacts compared to alternatives on the west side of the park.
SR 520 Alternative (D5)	Passes through several relatively large patches of coniferous and deciduous forest.
Redmond Way Alternative (E1)	Passes through several relatively large patches of coniferous forest.
Alternatives with Relatively Lower Expected Levels of Wildlife Displacement	
Elevated portion of: *Preferred NE 16th At-Grade Alternative (D2A)* NE 16th Elevated Alternative (D2E) NE 20th Alternative (D3)	Short distance near West Tributary to Kelsey Creek.
Preferred Marymoor Alternative (E2)	Passes through a few relatively large patches of coniferous forest. Borders on Marymoor Park with large grassy areas and poplar trees.
Leary Way Alternative (E4)	Passes through a few relatively large patches of coniferous forest.
Alternatives with very Low Expected Wildlife Displacement	
All Segment C Alternatives	Highly urbanized corridors.

4.2.1.1 Impacts Common to All or Most Build Alternatives

Impacts that would occur under all or most of the build alternatives are those related to noxious weeds and those resulting from construction noise and human activity. These impacts would occur in all areas where construction occurs.

Noxious Weeds

Noxious weeds and exotic plants rapidly colonize disturbed sites such as construction areas. They prevent native species from being re-established following ground disturbance, spread into undisturbed areas where they can affect habitat value on additional lands, and provide very poor wildlife habitat or forage. Several BMPs (included in Appendix A) are intended to avoid, reduce, and control new infestations of noxious weeds through a variety of actions. Consistent and successful application of these measures would reduce potential habitat disturbance and improve existing already-disturbed habitats. However, it is likely that some especially invasive weeds such as Himalayan blackberry would become established in some areas disturbed during construction. This invasive species prevents the re-establishment of native riparian species along streams and substantially reduces wildlife habitat value.

However, the East Link Project could also improve conditions where, in many cases, existing noxious weeds such as Himalayan blackberry, reed canarygrass, and/or Japanese knotweed dominate vegetated areas within the study area. In areas of permanent impact, these weedy areas would be removed. In areas of temporary impact, these weedy areas would likely be restored by native vegetation.

Impacts of Noise and Human Activity on Wildlife

Both noise and human activity have been demonstrated to displace wildlife from occupied habitats, interfere with the ability to hear territorial songs in birds, interfere with mating and alarm calls in amphibians and ground squirrels, and interfere with raptor foraging activities. There are numerous studies documenting wildlife avoidance of roads and facilities and wildlife disturbance from human activity at varying distances (Madsen, 1985; Van der Zande, et al., 1980; Fyfe and Olendorff, 1976).

However, most of these and similar studies have considered the impacts of new construction or facilities and human activities in areas where none or few of these facilities or human activities previously existed. This is not the case in the East Link study area, where roads, numerous transit corridors, residential and commercial development, and regular human activity are common features of most of the landscape. Wildlife that use habitats adjacent to the project alternatives are more or less accustomed to some level of human activity and noise. Impacts would be related to changes in noise levels and the types of human activities.

Measured constant day-time noise levels along I-90 and I-405 average about 70 to 72 A-weighted decibels (dBA) Leq (“equivalent” continuous sound level) at a distance of 100 feet from the roads. Noise levels along the I-90 bridge are projected to be 72 dBA Leq at 50 feet from the roadway, with maximum noise levels between 80 and 87 dBA Lmax (maximum noise level) when heavy trucks pass by, such as dump trucks and long-haul tractor trailers. This is typical for major interstate highways. Measured average noise levels along Bellevue Way SE are between 65 and 69 dBA Leq for front-line residences (less than 50 feet from the road) and between 60 and 64 dBA Leq for second-line homes (about 100 feet from the road). Some wildlife species undoubtedly already avoid noisier areas such as along I-90 and I-405. The potential temporary impacts on wildlife from increased noise and human activity during construction would be less than what would occur if the East Link Project were located in a rural area. However, some displacement of wildlife from otherwise useable habitat could occur. The degree of displacement would generally be proportional to the change in noise levels over background conditions; the distance of the construction activity from occupied habitats; the frequency, duration, and types of noise and human activity; and changes in the types of human activity during construction.

4.2.1.2 Specific Impacts of Alternatives by Segment

Vegetation and Wildlife

Project construction would require clearing and removal of vegetation from within the construction limits (approximately 35-foot-wide corridors along both sides of the 30-foot-wide operational right-of-way). The temporary construction disturbance would include the area beyond what would be required to accommodate the permanent facility. The estimated extent of the potential temporary construction impacts on vegetation is listed in Table 4-6, as most of the impact would occur to high-value habitats. Alternatives that are not listed would not affect these vegetation types.

Within the construction limits, animals of all types occupying areas that would be cleared would lose breeding, foraging, and roosting habitat. Less mobile species and those that retreat to burrows would likely be killed during this initial site work. More mobile species would likely flee to adjacent areas where they may not survive, depending on the availability of nearby suitable and unoccupied habitat. Suitable habitat for these species may be re-established within the construction limits over time, but increased noise and human presence combined with increased soil compaction may render some areas unsuitable for future re-occupancy by the affected species.

Affected Habitats and Species with Special Status

Affected Habitats

Table 4-6 includes an estimate of potential temporary construction impacts on vegetation and habitat types. The loss of these habitats would persist for varying lengths of time. It was assumed that areas supporting native upland or wetland vegetation and streambanks would be restored to their former condition following construction. These temporary, long-term impacts on shrub and forest habitats would persist for many years because of the time required for woody vegetation to grow enough to restore preconstruction functions.

	Riparian Forest	Urban Mostly Vegetated – Coniferous Forest	Urban Mostly Vegetated – Deciduous Forest	Urban Mostly Vegetated – Mixed Forest	Subtotal	Urban Moderately Vegetated	Blackberry	Urban Sparsely Vegetated	

Alternatives that are not listed would not affect these vegetation types.

[a] Vegetation polygons were classified and mapped regardless of size or upland/wetland designation. As a result, the vegetation polygons may include upland and/or wetland vegetation. Vegetation polygons may overlap with wetland polygons; therefore, affected acreage numbers for wetlands and vegetation/wildlife habitat cannot be added together. This overlap is depicted on Exhibits 3-23 to 3-26.
[b] Impacts on high-value habitats would require compliance with the Bellevue and Redmond CAOs.
Subtotals were added before rounding and therefore reflect true impacted area.
[c] Grand totals were added before rounding and therefore reflect the true impacted area.
[d] Impacts for C9T - East Main Station Design Option would not vary from those of *Preferred Alternative C9T*.

High-value habitats that would be temporarily affected within the construction limits and their locations include the following:

- Wetland and open water including Mercer Slough (Alternative B7) (see Section 4.3 for wetland impacts discussion)
- Riparian forest associated with Mercer Slough (Alternative B7)
- Urban Natural Open Space including Urban Mostly Vegetated - deciduous forest (all Segment B alternatives).

Segment B
The estimated area of high-value habitat that would be directly affected during clearing for construction in Segment B varies from approximately 1 acre (*Preferred Alterative B2M from C9T*) to approximately 4.6 acres (Alternative B7). Alternative B7 would affect more area of each high-value habitat than the other Segment B alternatives. Riparian forest is the highest value wildlife habitat type in the study area, followed by the deciduous and coniferous forest types. Wetlands, along with riparian forest, are the highest value wildlife habitat type in the project vicinity. While wetland impacts are addressed in Section 4.3 of this report, Alternative B7 would also temporarily affect more wetland area than the other Segment B alternatives.

All the Bellevue Way alternative routes would have a similar total impact on high-value habitat.

Preferred Alternative B2M would temporarily affect approximately 1 acre of high-value deciduous forest habitat, which includes the removal of some mature deciduous trees near the Bellevue Way SE and 112th Avenue SE intersection. Impacts on this area would be minimized to the maximum extent possible by limiting the temporary clearing of mature vegetation to the 35-foot-wide construction area on each side of the guideway. Due to the amount of similar available habitat in the Mercer Slough vicinity, impacts on wildlife would not be significant. This impact would be mitigated as required by the CAO.

Segment C
There would be relatively few temporary impacts on high-value habitat along Segment C.

Segment D
The estimated area of high-value habitat that would be directly affected during clearing for construction along Segment D varies from approximately 0.3 acre (Alterative D3) to approximately 2.0 acres (D2A - NE 24th Design Option).

Segment E
The estimated area of high-value habitat that would be directly affected during clearing for construction in Segment E varies from approximately 1.1 acres (Alterative E4) to approximately 2.1 acres (Alternative E1).

Federal and State Threatened and Endangered, and Candidate Species, and Species of Concern

Marbled Murrelet
During the nonbreeding season, marbled murrelets are rare and infrequent visitors to Lake Washington. They have been observed on the lake in the past but have not been documented to use the lake since the early 1990s. No impacts are expected because only one sighting has been observed in the last 50 years. As such, impacts are considered discountable.

Bald Eagle
None of the five bald eagle nests are located closer than 0.3 mile (about 1,580 feet) from any of the alternatives (see Table 3-9), and the shortest line-of-sight distance from a nest to a construction area would be 0.4 mile (about 2,110 feet). These distances are substantially greater than the recommended minimum of 660 feet. Therefore, according to the USFWS (2007b) bald eagle management guidance, potential impacts on nesting bald eagles during project construction would be minimized because disturbance levels would be lower than those specified in the guidelines.

Depending on screening vegetation, prevailing winds, topography, and the sensitivity of the nesting eagles to human activities, WDFW (2001) recommends possible expansion of the conditioned zone, or secondary zone, up to 2,640 feet from the edge of the protected zone, for a total distance of 3,640 feet. The shortest line-of sight distance from a nest to a construction area would be 2,112 feet under *Preferred Alternative A1* (see Table 3-9). The line-of sight distances from the other nests to the nearest construction area would be about 2,650 feet, 3,080 feet, and greater than 1 mile (two nests), respectively. Given the general location of these bald eagle nests in an urban area with relatively high levels of human activity, it is very unlikely that construction activities would directly or indirectly affect any of the existing bald eagle nest sites.

There are no known communal roosts within a half mile of any of the alternatives.

The change and increase in human activity from passing construction vehicles and people on foot outside of vehicles could displace eagles farther from the I-90 construction area. A study of bald eagles found that 50 percent of wintering eagles in open areas flushed at 500 feet from the source of human activity but that 98 percent will tolerate human activities at 1,000 feet (Stalmaster and Newman, 1979). Therefore, any increase in displacement in the vicinity of *Preferred Alternative A1* along I-90 would likely occur within 1,000 feet of the construction area. Given the large areas available for foraging, it is unlikely that this would result in impacts on bald eagle foraging and perching.

Bald eagles are suspected of foraging for salmon along Bear Creek during the fall and winter. Although specific foraging locations are not known, construction of *Preferred Alternative E2* or Alternatives E1or E4 across Bear Creek could temporarily displace bald eagles from the construction area.

Peregrine Falcon
Peregrine falcons still using the nest on the I-90 East Channel bridge might abandon the nest during construction. There is no way to estimate whether these birds would nest elsewhere during construction or whether they would reoccupy this nest after construction is complete.

Olive-Sided Flycatcher
The olive-sided flycatcher breeds in coniferous forests and might be present along the study area in Segments B and E, although none were recorded before or during surveys. There would be no temporary construction impacts on this species because only narrow strips of conifer forest would be affected by construction.

Willow Flycatcher
These birds typically breed in deciduous thickets, especially in willow thickets. Willow flycatcher nest sites are often close to water. There could be impacts on willow flycatcher habitat due to minor loss of scrub-shrub riparian habitat that could occur at Mercer Slough Wetland and Sturtevant Creek Wetland from any of the Segment B alternatives except Alternative B1.

State Candidate Species

Several other priority species are known to occur in the project vicinity. Aquatic species were addressed in Section 4.1 of this report. Table 4-7 lists these species and potential construction impacts on the species or their habitat. Stream crossings are specifically called out as an impact due to the loss of riparian habitat to occur as well as changes in other stream characteristics (see Section 4.1, Aquatic Resources).

TABLE 4-7
Potential Temporary Construction Impacts on State Candidate Species Likely or Known to Occur in the Study Area

Species[a]	Preferred Habitat	Potential Project Impacts
Pileated woodpecker	Requires wooded forests with a component of dead and dying trees and snags for foraging and nesting. Prefers deciduous forests but would use conifer forests with some deciduous tree component. Found at Marymoor Park. One bird observed in WR-5.	Signs of pileated woodpecker activity were observed in some larger forest stands. Some loss of forest habitat might occur. Any loss would persist for many years (*Preferred B2M*, B3, B3 - Design Option, B1, B2A, B2E, and B7).
Western grebe	Nests in colonies numbering up to several hundred birds on large inland lakes or in coastal marshes of the western United States.	This species could be displaced from some foraging area near I-90 during construction (*Preferred A1*).
Merlin	Seen during the nesting season at Marymoor Park. Unlikely to nest in the study area.	Impacts on this species would be very unlikely. Foraging areas would not be affected.
Purple martin	Nests in structures over water bodies. Forages for insects over open water or wet areas. Nesting observed at Marymoor Park in 2003.	There are no purple martin nests close enough to any of the alternatives to be affected by construction.

[a] Includes only those species not discussed in text.

Alternative Designations:
Preferred A1 = I-90
Preferred B2M = 112th SE Modified
B1 = Bellevue Way
B2A = 112th SE At-Grade
B2E = 112th SE Elevated
B3 = 112th SE Bypass
B3 - Design Option = 114th Extension
B7 = BNSF

4.2.3 Permanent Operational Impacts

Operational impacts are those that cause permanent displacement by the project alternatives, stations, maintenance facilities, traction power substations, and road widening. These impacts would occur during the early stages of construction within each segment and would be permanent.

4.2.3.1 Impacts Common to Most or All Action Alternatives

Many amphibian annual life cycles require seasonal migration between habitats with different ecological properties. These species' populations depend on dispersal connections and landscape links (Gibbs, 1998). Simple linear structures such as roads and at-grade tracks can act as physical and psychological barriers for amphibian movement (Mader, 1984; Gibbs, 1998). Areas where such movements may occur are between Mercer Slough Nature Park and forest remnants to the east and west of the park and between Bear Creek and Marymoor Park. However, the project vicinity already includes many roads that function as partial or complete physical barriers to seasonal amphibian movements between areas of suitable habitat. Few, if any, amphibians are likely to successfully cross the former BNSF Railway tracks and I-405 to the east of Mercer Slough Nature Park, or Bellevue Way to reach the coniferous patch west of the nature park.

Permanent indirect and qualitative impacts might also occur as a result of construction and operation activities. Potential permanent indirect impacts for each of the project alternatives may include the following:

- Conversion of existing high-quality, forest-dominated vegetation and wildlife habitat under and within 20 feet of each side of the elevated guideways to shrub and short-tree habitat, which may become high-quality habitat for some species, to prevent trees and branches from interfering with operation of the light rail
- Conversion of existing low-quality, weed-dominated, and disturbed vegetation and wildlife habitat under and within 20 feet of each side of the elevated guideways to shrub and short-tree habitat, which would be a substantial environmental improvement
- Light and habitat fragmentation

Impacts of Noise and Human Activity on Wildlife

The East Link project vicinity is predominantly urbanized, and the open spaces and open waters include high volumes of human activity with noise from adjacent roadways. East Link operations along elevated track sections adjacent to Mercer Slough (i.e., *Preferred Alternative B2M* and Alternatives B3, B3 - 114th Design Option, B2E, and B7) might result in noise impacts on wildlife above existing noise impacts from adjacent roadways. Noise from at-grade sections would not be expected to cause additional wildlife disturbance or displacement.

4.2.3.2 Specific Impacts of Alternatives by Segment

Vegetation and Wildlife

Table 4-8 provides estimates of the potential permanent operational impacts of the project on vegetation types in each of the segments.

Segment B

The potential area of high-value habitat that could be permanently affected in Segment B varies from approximately 0.8 acre (Alterative B2E) to approximately 3.2 acres (Alternative B7). Alternative B7 would affect the most area of riparian forest (0.6 acre). Alternatives B1 and B7 would affect the most high-value coniferous forest (1.2 acres each). Alternative B7 would affect the largest area of high-value deciduous forest (0.8 acre).

Preferred Alternative B2M to C11A and *B2M to C9T* would permanently affect 0.6 to 0.7 acre of high-value deciduous forest habitat, respectively, which includes the removal of some mature deciduous trees near the Bellevue Way SE/112th Avenue SE intersection. Due to the amount of similar available habitat in the Mercer Slough vicinity, impacts on wildlife would not be significant and would be mitigated as required by local Critical Area regulations.

Segment C

There would be relatively few permanent impacts on high-value habitat in Segment C.

Alternatives that are not listed would not affect these vegetation types.

[a] Vegetation polygons were classified and mapped regardless of size or upland/wetland designation. As a result, the vegetation polygons may include upland and/or wetland vegetation. Vegetation polygons may overlap with wetland polygons; therefore, impact acreage numbers for wetlands and vegetation/wildlife habitat cannot be added together. This overlap is depicted on Exhibits 3-23 to 3-26.

[b] These are high-value habitats and therefore effects on these areas would require adherence to the Bellevue and Redmond Critical Area ordinances.

[c] Impacts for C9T - East Main Station Design Option would not vary from those of *Preferred Alternative C9T*.

[d] Impacts for D2A - 120th Station Design Option would not vary from those of *Preferred Alternative D2A*.

Segment D

The estimated area of high-value habitat that would be directly affected during project operation in Segment D varies from approximately <0.1 acre (Alterative D3 via BNSF [C1T or C2T]) to approximately 1.3 acres (Alternative D5 via BNSF).

Preferred Alternative D2A would permanently affect approximately 0.9 acre of high-value habitat, including mostly riparian forest and deciduous forest. Alternative D5 would affect the most area of riparian forest, coniferous forest, and deciduous forest, with a total of up to 1.4 acres of high-value habitat permanently affected.

Segment E

The estimated area of high-value habitat that would be directly affected during permanent operation in Segment E varies from approximately 1.1 acres (*Preferred Alternative E2*) to approximately 2.1 acres (Alternative E1). Alternative E1 would affect the most area of high-value coniferous forest.

Maintenance Facilities

Potential permanent operational impacts on vegetation and habitat types from the maintenance facilities would be minor. Impacts would range from 0.1 acre with MF1 to 0.2 acre with MF2 from Alternative D5. MF3 and MF5 would result in no impacts.

Affected Habitats and Species

High-Value Habitats

Animals of all types that lose breeding, foraging, and roosting habitat within the project vicinity would be permanently lost unless they were able to occupy suitable unoccupied habitat nearby.

The loss of high-value habitats within the project vicinity would persist because lands would be occupied by project facilities. High-value habitats that would be permanently affected by the project, and their locations, include the following:

- In-stream habitats (see Section 4.1, Aquatic Resources)
- Wetlands (see Section 4.3) (all Segment B, D, and E alternatives)
- Riparian forest associated with Mercer Slough (Alternative B7) and along several streams in Segment D (*Preferred Alternative D2A* and Alternatives D2E and D5)
- Urban natural open space, including urban mostly vegetated—coniferous forest (all Segment B alternatives, small areas along several alternatives in Segments C and D, and all Segment E alternatives) and urban mostly vegetated – deciduous forest (all Segment B alternatives, areas along several alternatives in Segment D, and all Segment E alternatives).

Federal and State Threatened and Endangered, and Candidate Species, and Species of Concern

Marbled Murrelet

Project operations are not expected to permanently affect marbled murrelets because of the project's location along the existing I-90 bridge and because marbled murrelets are extremely rare in the study area (one sighting in the past 50 years on Lake Washington). Furthermore, the maximum operating noise levels are projected to be far below the injury and disturbance thresholds for murrelets established by the USFWS. Therefore, no operational impacts are expected.

Bald Eagle

Because of local bald eagle acclimation and distances to eagle nests, no impacts on bald eagles would be expected from operation of this project.

Peregrine Falcon

Because there is an existing active nest on I-90 that experiences vehicular noise, no permanent operational impacts on the peregrine pair or nest would be expected from operation of this project.

Olive-Sided Flycatcher

Because the potential habitat areas suitable for the olive-sided flycatcher are already adjacent to noisy arterial roadways habitats, no permanent impacts on the olive-sided flycatcher are expected from project operation.

Willow Flycatcher

Because the potential habitat areas suitable for the willow flycatcher are already near or being crossed by noisy arterial roadways and the project would not introduce more human activities near these habitats, no operational impacts on the willow flycatcher are expected.

Other State Species

Loss of high-value habitat and foraging as a result of project operation might affect some priority species.

4.3 Wetland Resources

Construction of the East Link Project could have permanent operational and temporary construction impacts on wetlands in the project vicinity. These include mostly direct and some potential indirect impacts. The following sections outline the range of potential impacts that could occur for each segment and alternative. Actual impacts would depend on the final alternative selection and design, construction footprint and methods, BMPs implemented during construction, and performance of post-construction wetland and buffer restoration.

No wetland resources were identified in Segment A, so this segment is not discussed in the text or shown on exhibits. The potential temporary construction and permanent operational impacts by alternative are summarized below. More detailed maps and tables listing the potential temporary construction and permanent operational impacts by alternative for individual wetlands and wetland buffers affected are included in Appendix F.

Vegetation polygons were classified and mapped regardless of size or upland/wetland designation. As a result, the vegetation polygons might include upland and/or wetland vegetation. Vegetation polygons might overlap with wetland polygons; therefore, affected acreage numbers for wetlands and vegetation/wildlife habitat cannot be added together. This overlap is depicted on Exhibits 3-23 to 3-26.

4.3.1 Temporary Construction Impacts

4.3.1.1 Types of Impacts Common to All Project Alternatives

It is assumed that construction areas would be only temporarily affected and that they would be restored to pre-project conditions after construction.

All vegetation within the construction limits (which varies by project alternative to a maximum of 100-foot-wide corridor) would be cleared. A temporary access road would be constructed using BMPs to avoid impacts on the remaining portions of the wetland. After construction the access road would be removed to restore the original wetland contours, and native shrubs and emergent vegetation would be planted, maintained, and monitored to achieve performance standards. Trees would not be planted under or within 20 feet on either side of the elevated guideway to prevent development of tall vegetation that could interfere with operation and safety of the light rail.

Short-term and long-term temporary impacts were previously defined in Section 1.4.1.1 of this report. The duration of temporary impacts can vary depending on the type of vegetation that is affected. For instance, temporary impacts on emergent wetlands are generally short-term, lasting for a limited time, with functions returning to pre-impact performance fairly soon (about 1 year or within one growing season of the impact).

Temporary impacts on woody vegetation (shrubs and trees) are generally long-term because functions can be restored over time, but not within a year or so due to the time required for shrubs and/or trees to grow enough to regain preconstruction functions.

Determining the boundaries of wetland vegetation types (such as emergent, scrub-shrub, forest) in order to calculate short-term and long term temporary direct impacts is beyond the scope of the analysis performed for all the alternatives evaluated in the Final EIS. This information would be developed during preparation of the permit application for the selected alternatives of the East Link Project.

According to Ecology et al. (2006), impacts on sites containing existing compensatory wetland mitigation projects should be avoided if possible. Unavoidable impacts on active mitigation sites (i.e., still under construction or being monitored) may require a greater amount of mitigation to address additional temporal loss of the original wetland's functions and area. Unavoidable impacts on a completed mitigation site (monitoring is completed and the permit requirements have been fulfilled) would be viewed similar to an impact on any other natural wetland.

Temporary impacts from construction activities can be either direct and quantifiable, or indirect and qualitative. Potential temporary direct impacts include the following:

- Vegetation clearing and temporary site grading and filling for access. After construction, contours in these areas would be restored to pre-project conditions and typically planted with native vegetation. In those areas of the study area where existing vegetation is dominated by weeds (such as blackberry, Japanese knotweed, and/or reed canarygrass), vegetation clearing would be an essential first step for restoration, such as what Bellevue Parks Department has been planning for the disturbed weedy area between 112th Avenue SE and Mercer Slough West (Bradley, 2009).

Temporary indirect impacts on the qualitative function of wetlands that could potentially occur with and/or adjacent to the construction limits include the following:

- Soil compaction during construction activities that contributes to a decrease in soil permeability, infiltration, water-storage capacity, and vegetation regrowth
- Accidental spills of fuel oils, chemicals, and/or concrete leachate used during construction that impact aquatic species
- Noise and human activity associated with construction activities that temporarily displace wildlife
- Some increase in sediment loading and turbidity from grading and filling activities that could allow runoff into wetlands and affect water quality

- Temporary changes in wetland hydrology due to soil compaction or access road construction
- Introduction of invasive species as a result of disturbance
- Management of existing invasive species as a result of disturbance and revegetation

4.3.1.2 Specific Impacts of the Alternatives in Each Segment

Table 4-9 shows potential temporary direct impacts on wetlands and wetland buffers for each segment and project alternative. These impacts are also shown graphically in Appendix F. There would be no temporary direct or indirect impacts on wetlands in Segment A. These temporary impacts would be in addition to the permanent operational impacts resulting from the project as described in Section 4.3.2.

TABLE 4-9
Potential Temporary Construction Direct Impacts on Wetlands and Wetland Buffers by Project Alternative[a]

Project Alternative	Wetland Category	Wetland Area Affected (acres)	Wetland Buffer Area Affected (acres)[b]

TABLE 4-9 CONTINUED
Potential Temporary Construction Direct Impacts on Wetlands and Wetland Buffers by Project Alternative[a]

Project Alternative	Wetland Category	Wetland Area Affected (acres)	Wetland Buffer Area Affected (acres)[b]
Segment D			
Preferred NE 16th At-Grade Alternative (D2A)[d]	2, 3, 4	0.5	1.7
NE 16th Elevated Alternative (D2E)– connecting from NE 6th (C1T, C2T)	2, 3, 4	0.2	0.6
Alternative D2E, NE 16th Elevated – connecting from NE 12th (C3T, C4A, C7E, C14E)	2, 3, 4	0.3	0.7
NE 20th Alternative (D3) – connecting from NE 6th (C1T, C2T)	3, 4	0.1	0.1
Alternative D3, NE 20th – connecting from NE 12th (C3T, C4A, C7E, C8E)	3, 4	0.1	0.1
SR 520 Alternative (D5) – connecting from NE 6th (C1T, C2T)	2, 3	0.4	0.8
Alternative D5, SR 520 – connecting from NE 12th (C3T, C4A, C7E, C8E)	2, 3	0.4	0.8
Segment E			
Preferred Marymoor Alternative (E2)	2, 3	0.1 (Mitigation site: <0.1)	0.9 (Mitigation site: 0.4)
E2 - Redmond Transit Center Design Option	2, 3	0.1 (Mitigation site: <0.1)	0.9 (Mitigation site: 0.3)
Redmond Way Alternative (E1)	2	0.1	0.3 (Mitigation site: 0.1)
Leary Way Alternative (E4)	2	<0.1	0.2 (Mitigation site: 0.1)

Values in parentheses are the portion of the total impact for each alternative that affect existing mitigation sites.
[a] Alternatives not listed would not have temporary construction impacts on wetlands or wetland buffers.
[b] Some of the impacts on stream buffers would overlap with impacts on some wetland buffers. Refer to Table 4-2 and Appendix F.
[c] Impacts for C9T - East Main Station Design Option would not vary from those of *Preferred Alternative C9T*.
[d] Impacts for D2A - 120th Station and NE 24th Design Options would not vary from those of *Preferred Alternative D2A*.

Segment B Direct Temporary Construction Impacts

Segment B Alternatives would have the greatest potential for unavoidable temporary impacts on wetlands and wetland buffers due to the proximity of existing transportation corridors to Mercer Slough wetlands and buffers (see Table 4-9). An existing stormwater pond located near the northeastern corner of the South Bellevue Park-and-Ride Lot was delineated and included as part of the Mercer Slough Wetlands (WR-1/2). All the alternatives that are routed along Bellevue Way SE have the potential for temporary construction impacts on this pond. During permitting, the regulatory agencies would be asked whether they would regulate this stormwater pond as a wetland. This pond provides necessary stormwater storage and treatment functions that would need to be replaced during construction if impacts could not be avoided.

Preferred 112th SE Modified Alternative (B2M)

Preferred Alternative B2M could temporarily impact 0.5 acre of Category 2 wetland located next to Bellevue Way SE and 112th Avenue SE (WR-1/2). Several existing wetland mitigation sites are located within Mercer Slough Nature Park. Of the area affected, a small portion (<0.1 acre) could be temporarily affected by *Preferred Alternative B2M* (see Table 4-9 and Appendix F).

The potential temporary impacts on wetlands would be primarily related to the following:

- Construction staging and access within the 35-foot-wide construction corridor east of the permanent Sound Transit right-of-way along Bellevue Way SE and 112th Avenue SE.
- Construction staging near the South Bellevue Park-and-Ride Lot, which would affect a portion of the Mercer Slough Wetland (WR-1/2), including the existing stormwater pond.

- Because *Preferred Alternative B2M* would be located immediately east of Bellevue Way SE and 112th Avenue SE, the potential temporary impacts on wetland buffers would be greatest compared to the other alternative routes along Bellevue Way SE. The potential temporary impacts on wetland buffers would be 4.0 and 3.7 acres for options connecting to *Preferred Alternatives C11A* or *C9T*, respectively (see Table 4-9).
- The condition of the wetland buffers that would be affected by construction includes unvegetated areas, areas of blackberry, lawn, and some deciduous forest (often with an understory of weeds such as Himalayan blackberry and patches of Japanese knotweed). The potential temporary impacts on wetland buffers would be primarily related to the following:
- Construction staging near the South Bellevue Park-and-Ride Lot
- Construction of the elevated guideway near the intersection of Bellevue Way SE and 112th Avenue SE, which would affect an area of deciduous forest with high-quality habitat
- Construction staging and access within the 35-foot-wide corridor located east of the operational right-of-way
- Construction impacts would occur on an existing mitigation site located immediately south of the South Bellevue Park-and-Ride Lot.
- Restoration of these affected buffers following construction could improve buffer function by replacing existing areas that are dominated by noxious and invasive weeds or lawn. This could improve the functions of the existing wetland and stream buffers and result in beneficial environmental impacts.

BNSF Alternative (B7)
Of all the alternatives evaluated, Alternative B7 has the potential for the largest temporary impact on wetlands (2.9 acres, see Table 4-9). The majority of this impact would result from crossing the Mercer Slough Wetland (WR-1/2), which would also include the largest impacts (1.1 acres) on several existing wetland mitigation sites. Alternative B7 would also affect a portion of the I-90 Mercer Slough Wetland (WR-4) and would bisect the WSDOT 118th Avenue SE Wetland (WR-5). In order to construct the guideway across Mercer Slough, a temporary work trestle might need to be built. The option of constructing the guideway with an overhead gantry could reduce temporary impacts and would be explored during final design. Alternative B7 would have the lowest potential temporary impact on wetland buffers of all the Segment B alternatives (0.6 acre).

Bellevue Way (B1), 112th SE At-Grade (B2A), 112th SE Elevated (B2E), and 112th SE Bypass (B3) Alternatives
All the other Segment B alternatives along Bellevue Way SE would have considerably lower temporary impacts on wetlands than Alternative B7. The other Bellevue Way alternatives would have higher temporary impacts on wetlands compared to *Preferred Alternative B2M*. Other than Alternative B7, Alternative B3 would have the highest temporary wetland impacts of the Segment B alternative because it bisects the Sturtevant Creek Wetland (WR-3). The other alternatives traveling along Bellevue Way SE would avoid wetland impacts on existing mitigation sites.

Alternatives B1, B2A, and B2E would have relatively low and similar potential impacts on wetlands and similar potential impacts on wetland buffers. Alternatives B2A, B2E, and B3 would have relatively similar potential buffers impacts that would primarily affect wetland buffers along 112th Avenue SE, which consist of disturbed vegetation dominated by Himalayan blackberry. Alternative B1 would have the lowest impact on wetland buffers of all the Bellevue Way alternatives.

The B3 - 114th Extension Design Option would avoid the temporary impact (approximately 0.6 acre) that Alternative B3 would have on the Sturtevant Creek wetland. This design option also would tie with Alternative B2E for the lowest wetland area affected (0.6 acre). However, this design option would include several additional small impacts on wetlands near the shoreline of Mercer Slough West, and involve an additional elevated crossing of Sturtevant Creek along the south side of SE 8th Street that might temporarily affect streamside wetlands and buffers. The B3 - 114th Extension Design Option would have the greatest impact on wetland buffers (4.8 acres).

Segment B Indirect Temporary Construction Impacts

Construction of Alternative B3 could have indirect temporary impacts on the Sturtevant Creek Wetland (WR-3) if construction activities hydrologically disconnect the northwest portion of this wetland from the remainder of the Sturtevant Creek wetland. Similarly, hydrologically disconnected portions of the Mercer Slough Wetland

(WR-1/2) and 118th Avenue SE Wetland (WR-5) could be indirectly affected during construction of Alternative B7, which would bisect these wetlands.

Segment C Direct Temporary Construction Impacts

The only potential wetland identified within Segment C is the Hilton Stormwater Pond (WR-16). The current design for alternatives proposed along 114th Avenue SE only with connections to Alternative B3 and B7 shows potential temporary construction impacts on this pond. The regulatory agencies would be asked during permitting whether they would regulate this stormwater pond as a wetland. This pond, which provides necessary stormwater storage and treatment functions, would need to be replaced during construction if impacts could not be avoided.

Preferred 108th NE At-Grade Alternative (C11A) and *Preferred 110th NE Tunnel Alternative (C9T)*

Preferred Alternative C11A connecting to *Preferred Alternative B2M* would avoid impacts on wetlands and wetland buffers. *Preferred Alternative C9T* connecting to *Preferred Alternative B2M* would have no impacts on wetlands but would have a small, temporary construction impact (less than 0.1 acre) on the Sturtevant Creek wetland buffer (WR-3) during construction.

Preferred Alternatives C11A or *C9T* connecting to Alternative B3, B3 - 114th Design Option, or B7 might have potential temporary construction impacts on the Hilton Stormwater Pond (WR-16) wetland buffer. Impacts on the pond buffer would overlap with the impacts on the stream buffer and are therefore not further described here to avoid double counting this buffer impact. The potential temporary impacts on wetland buffer would be primarily related to construction of the elevated guideway over Sturtevant Creek.

Other Segment C Alternatives

Other Segment C alternatives proposed along 114th Avenue SE connecting to Alternative B3 or B7 (Alternatives C2T, C3T, C4A, C7E, C8E, C9A, and C14 E) would have similar potential temporary impacts on the Hilton Stormwater Pond (WR-16) wetland buffer as described for *Preferred Alternatives C11A* and *C9T* connecting to Alternative B3. Alternatives C9A and C14E might also have a potential temporary construction impact on the WR-16wetland itself. The current design for Alternatives C9A and C14E shows a temporary impact on the portion of the pond at its outlet. For purposes of the East Link Project EIS, it was assumed that the function of the entire 0.1-acre pond would be temporarily disturbed (see Table 4.8-7 in Chapter 4, Section 4.8 of the Final EIS). Segment C alternatives that connect from Alternatives B2A or B2E would not affect WR-16.

Segment C Indirect Temporary Construction Impacts

No indirect temporary construction impacts on wetlands are expected in Segment C.

Segment D Direct Temporary Construction Impacts

In Segment D, the potential temporary construction impacts on wetlands and wetland buffers would vary by alternative but in general would be relatively small (see Table 4-9).

Preferred NE 16th At-Grade Alternative (D2A)

To construct *Preferred Alternative D2A*, elevated crossings over five wetlands (WR-7, WR-8SE, WR-11, WR-10W, and WR-15) and road construction related to the retained cut across 120th Avenue NE (WR-17) would result in potential temporary impacts on 0.5 acre of wetland and 1.7 acres of wetland buffer. This alternative would have the largest temporary impact on wetlands and wetland buffers compared to the other Segment D alternatives; however, the total impact would be relatively low. The potential temporary impacts on wetlands and wetland buffers would be primarily related to staging and access necessary to construct the elevated guideway and would affect mostly Category 3 wetlands, a very small amount of one Category 2 forested wetland, and buffers that are currently disturbed by surrounding development, noxious weeds, stormwater from parking lots and buildings, and litter.

No existing mitigation sites are located within the Segment D study area.

Direct temporary construction impacts on wetland resources would be the same with either the D2A - 120th Station Design Option or NE 24th Design Option, and would be the same as described for *Preferred Alternative D2A*.

NE 20th Alternative (D3)

Alternative D3 would result in the smallest temporary impacts on wetlands (0.1 acre) and wetland buffers (0.1 acre, for either connection from NE 6th or NE 12th) compared to all the Segment D alternatives (see Table 4-9). This alternative would completely avoid all impacts on the wetlands east and west of 140th Avenue NE (WR-10E, WR-10W, and WR-11). This alternative would have minor temporary impacts on wetlands WR-6, WR-8, and WR-15. In addition, connecting from Segment C via Alternative B7 (rather than via NE 12th Street) would further avoid a small impact on the BNSF Matrix Wetland (WR-6).

NE 16th Elevated (D2E) and SR 520 (D5) Alternatives
The amount of temporary impact on wetlands and wetland buffers from Alternatives D2E and D5 would be less than *Preferred Alternative D2A* but more than Alternative D3 (see Table 4-9).

Alternative D5, which is also completely elevated, would have temporary impacts primarily on the West Tributary to Kelsey Creek Riparian Wetland Northwest (WR-8NW) and the wetland west of 140th Avenue NE (WR-11).

Segment D Indirect Temporary Construction Impacts
Construction of *Preferred Alternative D2A* with either design option and Alternatives D2E and D5 could indirectly affect wetland WR-11 if construction activities hydrologically disconnect the southeastern portion of this wetland from the remainder of the wetland.

Segment E Direct Temporary Construction Impacts
Preferred Marymoor Alternative (E2)
Construction of *Preferred Alternative E2* would result in potential temporary impacts on 0.1 acre of wetland and 0.9 acre of wetland buffer. An unavoidable temporary impact on Marymoor Park Wetland (WR-13) would result from the at-grade route along SR 520 and elevated crossing over Bear Creek Wetland (WR-12). These impacts include a potential minor (< 0.1 acre) temporary disturbance to existing mitigation wetlands at the Marymoor Park Wetland (WR-13) and a potential minor (0.4 acre) temporary disturbance to buffers at the Marymoor Park Wetland and at SR 520 Bear Creek 1 and 2 mitigation sites at NE 76th Street.

Construction of the E2 - Redmond Transit Center Design Option would result in potential temporary impacts similar to *Preferred Alternative E2*. Potential temporary impacts on wetlands would be 0.1 acre, and 0.9 acre on wetland buffer.

Other Segment E Alternatives
Potential impacts on wetlands and wetland buffers from Alternative E1 would be the same for wetlands and slightly less for wetland buffers than those described for *Preferred Alternative E2*, as shown in Table 4-9. Potential impacts on wetlands and wetland buffers from Alternative E4 would be slightly less than those described for *Preferred Alternative E2.*

Segment E Indirect Temporary Construction Impacts
No indirect temporary construction impacts on wetlands are expected in Segment E.

4.3.2 Permanent Operational Impacts

4.3.2.1 Types of Impacts Common to All Alternatives
Permanent direct impacts are those that occur inside the project limits where the permanent alternatives (i.e., at-grade alternatives, columns for elevated structures), stations, maintenance facilities, park-and-ride lots, traction power substations, permanent access roads, stormwater facilities, and road widening would occur. It is assumed that these areas would be permanently affected and all wetlands or buffers within these areas would be lost. For purposes of the Final EIS, this also includes wetlands and wetland buffers under the elevated guideway. During future design and permitting, impacts on wetlands under elevated structures would be evaluated more closely to determine whether the expected vertical clearance over wetlands would allow sufficient sunlight and precipitation to restore some of these wetlands and buffers.

Wetlands typically receive water from groundwater or surface water sources. Vegetation within buffer areas receives water directly from precipitation. Therefore, the elevated guideway might create a rainshadow effect and in some cases might also have a low clearance that could also limit sunlight. Situations were observed at several locations along Sound Transit's Central Link route where vegetation replanted within buffers under the elevated guideway was having difficulty re-establishing due to limited summer water and/or light. Estimating this impact is complicated and depends on multiple variables, such as slope, aspect, soil conditions, and stormwater dispersion from the elevated guideway. All these variables make for a complicated buffer impact analysis that exceeds the site and design information available during the Final EIS. It is expected, therefore, that permanent impacts on wetlands associated with elevated sections of the alternatives can be avoided or further minimized during final design and during construction.

Permanent indirect and qualitative impacts might also occur as a result of construction and operation activities. Potential permanent indirect impacts for each of the project alternatives include the following:

- Conversion of forest-dominated wetlands to shrub-dominated wetlands and buffers under and within 20 feet of each side of the elevated guideways to prevent trees and branches from interfering with operation of the light rail
- Partial shading of areas of wetlands and buffers from shadows cast beyond the elevated structure footprint
- Trackway and paved area runoff to surface waters or wetlands that degrade water quality
- Hydrologic disconnection

4.3.2.2 Specific Impacts of the Alternatives in Each Segment

Table 4-10 shows potential direct, permanent operational impacts on wetlands and wetland buffers for each segment and project alternative. These impacts are also shown graphically in the figures in Appendix F. There would be no direct or indirect permanent wetland impacts from Segments A or C. Attachment 2 in Appendix F contains tables of the quantitative impact information by alternative.

Segment B Direct Permanent Impacts

Compared to other segments, Segment B alternatives would have a slightly greater potential for unavoidable permanent impacts on wetlands and wetland buffers due to the constraints from and proximity of existing transportation corridors to Mercer Slough wetlands and buffers (see Table 4-10).

Preferred 112th SE Modified Alternative (B2M)

Preferred Alternative B2M would be located along the east side of Bellevue Way SE and 112th Avenue SE, but its route almost entirely avoids permanent impacts on wetlands (0.1 acre) (see Table 4-10). The impacts would be to Category 2 wetlands.

TABLE 4-10
Permanent Operational Direct Impacts on Wetlands and Wetland Buffers by Project Alternative[a]

Alternative and Connection	Category	Wetland Area Affected (acres)	Wetland Buffer Area Affected[b] (acres)
Segment B			
Preferred 112th SE Modified Alternative (B2M) to C11A, 112th SE Modified	2	0.1	3.3 (Mitigation site: 0.2)
Preferred Alternative B2M to C9T [c]	2	0.1	4.5 (Mitigation site: 0.2)
Bellevue Way Alternative (B1)	2	0.2	1.8
112th SE At-Grade Alternative (B2A)	2	0.2	3.4 (Mitigation site: <0.1)
112th SE Elevated Alternative (B2E)	2	0.2	2.8 (Mitigation site: <0.1)
112th SE Bypass Alternative (B3)	2	0.7	3.4 (Mitigation site: <0.1)
B3 - 114th Extension Design Option	2	0.2	3.6 (Mitigation site: <0.1)
BNSF Alternative (B7)	2, 4	1.9 (Mitigation site: 0.4)	0.4 (Mitigation site: <0.1)
Segment C (Alternatives with connections to Alternatives B3, B3 – 114th Design Option, or B7 only)			
Preferred 108th NE At-Grade Alternative (C11A)	3	0	0.1
Preferred 110th NE Tunnel Alternative (C9T)[c]	3	0	0.1
106th NE Tunnel Alternative (C2T)	3	0	0.1
108th NE Tunnel Alternative (C3T)	3	0	0.1
At-Grade Couplet Alternative (C4A)	3	0	0.1

TABLE 4-10 CONTINUED
Permanent Operational Direct Impacts on Wetlands and Wetland Buffers by Project Alternative[a]

Alternative and Connection	**Category**	**Wetland Area Affected (acres)**	**Wetland Buffer Area Affected[b] (acres)**
112th NE Elevated Alternative (C7E)	3	0	0.1
110th NE Elevated Alternative (C8E)	3	0	0.1
110th NE At-Grade Alternative (C9A)	3	0 (<0.1 for B3 connection only)	0.1
114th NE Elevated Alternative (C14E)	3	0 (<0.1 for B3 connection only)	0
Segment D			
Preferred NE 16th At-Grade Alternative (D2A)[d]	*2, 3, 4*	*0.5*	*0.6*
NE 16th Elevated Alternative (D2E) from NE 6th (C1T, C2T)	2, 3, 4	0.2	0.5
Alternative D2E, NE 16th Elevated from NE 12th (C3T, C4A, C7E, C14E)	2, 3, 4	0.3	0.5
NE 20th Alternative (D3) from NE 6th (C1T, C2T)	3, 4	0.2	0.1
Alternative D3, NE 20th from NE 12th (C3T, C4A, C7E, C8E)	3, 4	0.2	0.1
SR 520 Alternative (D5) from NE 6th (C1T, C2T)	2, 3, 4	0.2	0.6
Alternative D5, SR 520 from NE 12th (C3T, C4A, C7E, C8E)	2, 3, 4	0.3	0.7
Segment E			
Preferred Marymoor Alternative (E2)	2, 3	0.1 (Mitigation site: 0.1)	0.4 (Mitigation site: <0.1)
E2 - Redmond Transit Center Design Option	2, 3	0.1 (Mitigation site: 0.1)	0.5 (Mitigation site: <0.1)
Redmond Way Alternative (E1)	2	0.1	0.2 (Mitigation site: 0.1)
Leary Way Alternative (E4)	2	< 0.1	0.2 (Mitigation site: 0.1)

Values in parentheses are the portion of the total impact for each alternative that affect existing mitigation sites.
[a] Alternatives not listed do not have direct short-term wetland or wetland buffer impacts.
[b] Some of the impacts on stream buffers overlap with impacts to some wetland buffers. Refer to Table 4-2 and Appendix F.
[c] Impacts for C9T - East Main Station Design Option would not vary from those of *Preferred Alternative C9T*.
[d] Impacts for D2A - 120th Station and NE 24th Design Options would not vary from those of *Preferred Alternative D2A*.

The potential permanent impacts on wetlands would be primarily related to the following:

- Sections of elevated guideway (this situation will be evaluated further during future design phases to evaluate potential to restore buffer under the elevated guideway).
- Retained cut immediately north of the blueberry farm. During future design, Sound Transit will continue to evaluate the potential for impacts on wetlands from this retained cut.

Unlike the other alternatives routes along Bellevue Way SE, *Preferred Alternative B2M* would not involve permanent impacts on wetlands from a new stormwater pond near the South Bellevue Station.

The potential impacts on wetland buffers range from 3.3 acres for *Preferred Alternative B2M to C11A* to 4.5 acres for *Preferred Alternative B2M to C9T*. The impact on wetland buffers from *Preferred Alternative B2M to C9T* would be the largest of all the Segment B alternatives. The condition of the wetland buffers that would be permanently affected by light rail operation includes existing unvegetated areas, disturbed areas with blackberry, maintained lawn, and some deciduous forest (often with an understory of weeds such as Himalayan blackberry and Japanese knotweed). The potential permanent impacts on wetland buffers would be primarily related to the following:

- Sections of at-grade guideway along 112th Avenue SE.

- Sections of elevated guideway. (This situation will be evaluated further during future design phases to evaluate the potential to restore buffer under the elevated guideway.)
- Section of retained cut immediately north of the Winters House. This would affect a forested area with high-quality habitat.

Other Segment B Alternatives
All the other Segment B alternatives would have some permanent operational impact on wetlands.

Alternative B7 has the potential for the greatest permanent impacts on wetlands (1.9 acres, see Table 4-10). Nearly one-quarter of this impact would be on existing mitigation sites. Alternative B7 would have the smallest permanent impact on wetland buffers.

The other Segment B alternative routes along Bellevue Way SE (Alternatives B1, B2A, and B2E) would all permanently affect approximately 0.2 acre of wetland, which would largely result from the new stormwater pond proposed immediately east of the South Bellevue Station. All of these Segment B alternatives would avoid permanent wetland impacts on existing mitigation sites within the Mercer Slough Nature Park.

Alternative B3 could potentially impact 0.7 acre of wetlands. It would have similar impacts on wetlands along Bellevue Way SE as the other alternative routes that travel along Bellevue Way. However, construction of the elevated guideway through the Sturtevant Creek Wetland (WR-3) would also disturb 0.5 acre of shrub and emergent Category 2 wetlands dominated by reed canarygrass (a state-listed noxious weed).

Implementing the B3 - 114th Extension Design Option would reduce the potential permanent operational impacts on wetlands by avoiding the Sturtevant Creek Wetland (WR-3). Therefore, this design option would have similar permanent impacts on wetlands as the other alternatives along Bellevue Way SE.

These other Segment B alternatives would have varying degrees of potential permanent impacts on wetland buffers. Among the other Segment B alternatives along Bellevue Way SE, Alternative B7 would have the least permanent impacts on wetland buffers (0.4 acres). Alternatives B2A, B2E, and B3 would have relatively similar potential permanent impacts on buffers that would partially affect the disturbed area immediately east of the existing South Bellevue Park-and-Ride Lot, a portion of which is maintained as access to the existing stormwater pond, and a portion of which is existing forest. All of these Segment B alternatives (except Alternative B1) would permanently affect wetland buffers of existing mitigation sites within the Mercer Slough Nature Park.

Segment B Indirect Permanent Impacts

Indirect permanent impacts may include the potential for shading impacts from Alternative B7 along the north side of I-90 due to the effect that the existing I-90 roadway already has on southerly sun exposure. Also, Alternative B7 would further increase the effective width of the combined transportation footprint (I-90 elevated roadway plus East Link elevated guideway) that bisects the Mercer Slough wetlands. Also, Alternative B7 would permanently bisect the 118th Ave SE Wetland (WR-5), which could reduce the functions of this wetland and increase the overall impact on this wetland.

Portions of *Preferred Alternative B2M* would be constructed in retained cuts along Mercer Way SE. The concrete-lined retain cuts could intercept and redirect local groundwater flow with resulting adverse impacts to down-gradient wetlands. However, mitigation would be designed to alleviate such impacts (see Section 5.3.1). Similarly, track foundations in many places along this section of *Preferred Alternative B2M* would be improved with subsurface stone columns; however, these columns would not affect groundwater flow because they are pervious to groundwater movement.

Also, unavoidable indirect permanent impacts on wetlands would result after restoration of the temporary impacts on wetlands (described in Section 4.3.1). These wetlands would be restored after construction and would continue to function as wetlands. However, an associated permanent impact would result from converting existing forest-dominated wetlands to future shrub-dominated wetlands under and within 20 feet of each side of the elevated guideways to prevent trees and branches from interfering with operation of the light rail. This change in vegetation type (forest to shrub) is considered a vegetation conversion impact.

Forested wetland vegetation that cannot be restored with trees because of safety concerns would generally be planted with woody shrub vegetation to minimize any loss of function related to vegetation conversion. A vegetation conversion from trees to shrubs would result in a smaller loss of function than a vegetation conversion from trees to emergent plants. During future design and permitting, Sound Transit will evaluate the potential impact of vegetation conversion and maximize the wetland functions at the restored construction sites. Sound Transit might propose other habitat improvements (such as adding downed logs and managing noxious weeds) as mitigation for the loss of function from converting the vegetation in some wetlands from trees to shrubs.

See Section 4.1, Aquatic Resources, for potential indirect permanent impacts on Mercer Slough, Kelsey Creek, and Sturtevant Creek.

Segment C Permanent Impacts

The only direct or indirect permanent impacts on wetlands or wetland buffers from Segment C alternatives would occur at the Hilton Hotel stormwater pond (WR-16). Alternatives C9A and C14E connecting to Alternative B3 would impact less than 0.1 acre of wetlands at the Hilton Hotel stormwater pond. A 0.1 acre impact on wetland buffers at the Hilton Hotel stormwater pond (WR-16 would occur with Alternatives C2T, C3T, C4A, C7E, C8E, C9A, and C14E with connections to either Alternative B3, B3 – 114th Extension Design Option, or B7.

Segment D Direct Permanent Impacts

Preferred NE 16th At-Grade Alternative (D2A)

Preferred Alternative D2A would avoid permanent operational impacts on wetlands except for WR-11 and WR-15 (resulting from fill for the at-grade trackway) and WR-7 and WR-8 SE where the elevated guideway would cross over. Potential permanent operational impacts on wetlands and buffers would be 0.5 and 0.6 acre, respectively. This would be a small, permanent operational impact on these Category 3 and 4 wetlands. The primary impact would be on WR-7.

Impacts on wetlands and wetland buffers from both D2A design options (120th Station and NE 24th) would essentially be the same as with *Preferred Alternative D2A*.

The storage track along the former BNSF Railway corridor north of Lake Bellevue would result in impacts of approximately 0.1 acre on wetlands and 0.1 acre on wetland buffers to accommodate an access path adjacent to the storage tracks.

Other Segment D Alternatives

The other Segment D alternatives and connection options would have approximately half of the permanent operational impacts on wetlands compared to *Preferred Alternative D2A*, primarily because they would avoid impacts on Wetland WR-7. Alternative D2E would permanently affect 0.2 to 0.3 acre of wetland (depending on connection option) because of the elevated guideway over Wetlands WR-6, WR-8SE, WR-11, and WR-15. Alternative D3 would permanently affect 0.2 acre of wetland from the fill used to widen 136th Place NE for the at-grade trackway at Wetland WR-15 and the elevated guideway over Wetlands WR-6 and WR-8SE. Alternative D5 would permanently affect 0.2 to 0.3 acre of wetland (depending on connection option) due to elevated guideway over Wetlands WR-6, WR-8NW, and WR-11.

Potential permanent impacts on wetland buffers would be lowest (0.1 acre) for Alternative D3 and would be slightly greater for Alternatives D2E and D5.

Table 4-11 shows the potential direct permanent wetland and wetland buffer impacts associated with the four maintenance facility locations in Segment D. MF1, MF2, and MF2 (D5) would have minor impacts on the Category 3 WR-6 wetland and its buffers. MF3 (*Preferred Alternative D2A* and Alternatives D2E and D3) would have minor permanent impacts on the Category 4 WR-15 wetland.

Segment D Indirect Permanent Impacts

Fill from the at-grade portion of *Preferred Alternative D2A* and both D2A design options, or from the elevated section of Alternative D2E, could result in indirect permanent impacts on Wetland WR-11 by disconnecting hydrology in the remaining western portions of the wetland.

TABLE 4-11
Permanent Operational Impacts on Wetlands and Wetland Buffers by Maintenance Facility Placement

Maintenance Facility	Wetland Locator – Wetland Name	Category	Wetland Affected Area (acres)	Wetland Buffer Affected Area (acres)
MF1, 116th (*Preferred D2A*, D2E, D3)	WR-6—BNSF Matrix Wetland	3	0.1	0.1
MF2, BNSF (*Preferred D2A*, D2E, D3)	WR-6—BNSF Matrix Wetland	3	0.1	0.1
MF2, BNSF (D5)	WR-6—BNSF Matrix Wetland	3	0.1	0.2
MF3, SR520 (*Preferred D2A*, D2E, D3)	WR-15—Unnamed Tributary to Kelsey Creek Wetland	4	<0.1	0

Also, unavoidable indirect permanent impacts on wetlands would result following restoration of the temporary wetlands impacts (described in Section 4.3.1). These wetlands would be restored after construction and would continue to function as wetlands. However, an associated permanent impact would result from converting existing forest-dominated wetlands to future shrub-dominated wetlands under and within 20 feet of each side of the elevated guideways to prevent trees and branches from interfering with operation of the light rail. This change in vegetation type (forest to shrub) would be a vegetation conversion impact.

See Section 4.1, Aquatic Resources, for potential indirect permanent impacts on the West Tributary to Kelsey Creek, Unnamed Tributary to Kelsey Creek, and Valley Creek.

Segment E Direct Permanent Impacts

Preferred Marymoor Alternative (E2)

Preferred Alternative E2 has the potential to permanently affect up to 0.1 acre of wetland and 0.4 acre of wetland buffer. *Preferred Alternative E2* would affect the existing mitigation wetland and buffers at the Marymoor Park Wetland (WR-13) and the wetland and stream buffer at the railroad crossing at the Bear Creek Wetland (WR-12). Approximately 0.1 acre of wetland and less than 0.1 acre of buffer in the northern portion of the mitigation wetland (WR-13) would be lost due to the construction of the at-grade section of *Preferred Alternative E2* through the mitigation site.

Impacts on wetlands with the E2 - Redmond Transit Center Design Option would be the same as described above for *Preferred Alternative E2*. Impacts on wetland buffers with this design option would be slightly more than with *Preferred Alternative E2*.

Other Segment E Alternatives

Alternatives E1 and E4 would have comparable direct, permanent impacts on wetlands and wetland buffers.

Segment E Indirect Permanent Impacts

Unavoidable indirect permanent impacts on wetlands would result following restoration of the temporary wetlands impacts (described in Section 4.3.1). These wetlands would be restored after construction and continue to function as wetlands. However, an associated permanent impact would result from converting existing forest-dominated wetlands to future shrub-dominated wetlands under and within 20 feet of each side of the elevated guideways to prevent trees and branches from interfering with light rail operations. This change in vegetation type (forest to shrub) is considered a vegetation conversion impact.

See Section 4.1, Aquatic Resources, for potential indirect permanent impacts on Sammamish River and Bear Creek.

This page intentionally left blank.

Chapter 5

Potential Mitigation Measures

Appendix A (Best Management Practices for Sensitive Ecosystem Resources) identifies the typical regulatory requirements for avoidance and minimization of impacts on ecosystem resources during design and construction. Sound Transit might also take additional measures to avoid and minimize impacts on sensitive natural resources as needed. The Biological Assessment (Sound Transit, 2010) prepared for ESA consultation also outlines conservation measures and proposed aquatic habitat improvements that would become conditions of federal approvals for the project. Based on this analysis, and the mitigation measures proposed herein, the NMFS and the USFWS concurred that the determination for ESA-listed species is "**May Affect, Not Likely to Adversely Affect"** and the determination for Essential Fish Habitat under the Magnuson-Stevens Fishery Conservation and Management Act would be "**No Adverse Effect**."It is important to note that the Biological Assessment only covers the *Preferred Alternative*.

To the extent that impacts cannot be avoided or minimized through BMPs, Sound Transit would implement the compensatory mitigation measures described in Sections 5.1 through 5.3.

5.1 Aquatic Resources Mitigation Measures

- On Sturtevant Creek at the Hospital Station where realignment of the stream channel would be required (with *Preferred Alternatives C11A* and *C9T* and Alternatives C1T, C2T, C9A, or C14E), Sound Transit would reconstruct the new channel with natural stream habitat features. Riparian habitat functions would be improved with native riparian plantings. This reach is currently lacking shade. The newly shaded reach would help lower stream temperatures in the downstream reaches that support salmonids. Specific requirements and details of these measures would be established during final design and project permitting.
- For Alternatives D3 or D5, which have culvert lengthening or shortening (Goff Creek [D5] and Valley Creek [D3]), habitat might be improved by placing LWD. For maximum benefit to fisheries, habitat improvements could be done in either Goff Creek, Valley Creek, or West Tributary to Kelsey Creek below the anadromous fish barriers, wherever the best improvements and access exist. Along the West Tributary to Kelsey Creek, enhancement could include creating wider buffers for habitat and open space, environmental education, and stormwater management.
- As mitigation for the increased culvert length on the Unnamed Tributary to Kelsey Creek (with *Preferred Alternative D2A* and Alternatives D3 and D2E), Sound Transit proposes to coordinate with the City of Bellevue to find and develop instream habitat improvements on Goff Creek in coordination with the City of Bellevue's larger plans to restore and daylight the creek.
- Riparian plantings to mitigate impacts in riparian areas from shading by elevated tracks or bridges would be possible in a number of locations, such as in Mercer Slough, West Tributary to Kelsey Creek, Valley Creek, Bear Creek, and Sammamish River. The Sammamish River would receive the most benefit from this mitigation.
- Sound Transit would consult with the Tribes to avoid impacts on Tribal fisheries from construction work in Lake Washington, barge/boat transit through the Lake Washington ship canal, or barge/boat approaches to the Ballard Locks.
- In-water work would be conducted during approved in-water construction windows. Where ESA-listed species might be present, stream crossings would not require in-water work and the project would not install infrastructure below the OHWM. If over-water construction is conducted over Mercer Slough (with Alternative B7) or the Sammamish River (all Segment E alternatives) during the migratory period of ESA-protected species, nighttime lighting would be shielded from the waters below.

5.2 Vegetation and Wildlife Resources Mitigation Measures

- Areas disturbed in the construction staging areas would be revegetated with native vegetation within one year of construction completion.
- Sound Transit would update its survey of bird nests during final design. If a bald eagle nest is found within a half mile of the proposed construction limits, a bald eagle management plan would be prepared. Under the MBTA, nesting migratory bird nests cannot be destroyed during the breeding season. Sound Transit would consult with the USFWS on methods to implement during construction to avoid impacts on migratory birds consistent with the MBTA and the Bald and Golden Eagle Protection Act. Such methods would include clearing in the Mercer Slough buffer outside the nesting season for migratory birds.
- High-value habitat regulated by local agency regulations that are affected by the project would be mitigated with habitat replacement or enhancement. The type of habitat to be established would depend on the affected species. The type of habitat to be replaced and mitigation ratios would be determined through discussions with local permitting agencies during final design and project permitting.
- Sound Transit would adhere to local ordinances regarding tree replacement ratios.

5.3 Wetland Resources Compensatory Mitigation Measures

Sound Transit is committed to achieving no net loss of wetland function and area on a project-wide basis. Sound Transit would apply appropriate current available agency guidance developed jointly by the Washington Department of Ecology, U.S. Army Corps of Engineers Seattle District, and the U.S. Environmental Protection Agency Region 10 (Ecology et al., 2006a and 2006b) and applicable Critical Areas Ordinances for the Cities of Bellevue and Redmond. To the extent possible, compensatory mitigation sites would be identified and compensate for lost values in-kind. Sound Transit determined there are several opportunities for wetland mitigation in the study area that are expected to meet required mitigation ratios. The specific compensatory mitigation for the selected alternative would be determined during final design and project permitting.

The *Preferred Alternatives* for the proposed East Link Project would permanently affect approximately 0.7 acre of various wetlands (see Table 5-1). This relatively small amount of impact for an 18-mile-long project reflects Sound Transit's commitment to avoid and minimize environmental impacts. To compensate for these unavoidable permanent impacts, several mitigation strategies are available. Agency guidance developed jointly by Ecology, USACE Seattle District, and U.S. Environmental Protection Agency Region 10 (referred to hereafter as the Joint Guidance) (Ecology et al., 2006a and 2006b) allows for strategies that include wetland re-establishment (combined with creation), rehabilitation, and enhancement.

TABLE 5-1
Summary of Permanent Direct Impacts from the Preferred Alternatives by Segment

Segment (Preferred Alternative)	Permanent Wetland Impacts (acres)	Permanent Buffer Impacts (acres)
Segment A – *A1*	0	0
Segment B – *B2M*	0.1	3.3 to 4.5
Segment C – *C11A* or *C9T*	0 to <0.1	0
Segment D – *D2A*	0.6	0.6
Segment E – *E2*	0.1	0.4
Total[a]	**0.7**	**4.2 to 5.4**

[a] The totals in this row might not add up because the impact acreage numbers are rounded up or down.

Mitigation ratios are guidelines from which case-by-case considerations start. To determine the appropriate mitigation ratios for this project, the project team may propose adjustments to these guidelines to take into consideration unique project circumstances.

The *Preferred Alternatives* for the proposed East Link Project would temporarily affect approximately 6.3 to 6.6 acres of various wetlands and 1.1 to 1.2 acres of wetland buffer (see Table 5-2). These wetlands would be restored after construction and continue to function as wetlands. However, an associated permanent impact would result from converting existing forest-dominated wetlands to future shrub-dominated wetlands under and within 20 feet of each side of the elevated guideways to prevent trees and branches from interfering with operation of the light rail. This change in vegetation type (forest to shrub) is considered a vegetation conversion impact.

To estimate the mitigation required, Sound Transit currently assumes that all the wetlands that are temporarily affected during construction would have a vegetation conversion impact. The actual vegetation conversion impact areas will be determined during future design when more detailed information along the selected alternative routes is available for the existing wetland vegetation types, railway design, and associated construction impacts. Sound Transit would conduct detailed site surveys to establish existing topography and would conduct hydrologic monitoring to reestablish the topography after project construction. Restoration would need to amend the soil and replace vegetation.

TABLE 5-2
Summary of Potential Temporary Construction Direct Impacts from the Preferred Alternatives by Segment

Segment (Preferred Alternative)	Temporary Wetland Impacts (acres)	Temporary Buffer Impacts (acres)
Segment A – *A1*	0	0
Segment B – *B2M*	0.5	3.7 to 4.0
Segment C – *C11A or C9T*	0	0 to <0.1
Segment D – *D2A*	0.5	1.7
Segment E – *E2*	0.1	0.9
Total[a]	**1.1 to 1.2**	**6.3 to 6.6**

[a] The totals in this row might not add up because the impact acreage numbers are rounded up or down.

Forested wetland vegetation that cannot be restored with trees due to safety concerns would generally be planted with woody shrub vegetation to minimize any loss of function related to vegetation conversion. A vegetation conversion from trees to shrubs would result in a smaller loss of function than a vegetation conversion from trees to emergent plants. During future design and permitting, Sound Transit would evaluate the potential impact of vegetation conversion and maximize the wetland functions at the restored construction sites. Sound Transit might propose other habitat improvements (such as adding downed logs and managing noxious weeds) as mitigation for the loss of function from converting the vegetation in some wetlands from trees to shrubs.

In addition, the City of Bellevue's critical areas ordinance requires that critical area buffers disturbed or affected shall be replaced at a ratio of one-to-one (1:1). Other mitigation requirements may also result from potential impacts on aquatic resources. It is environmentally and economically desirable to maximize the ecological functions at sites by consolidating as many mitigation requirements as possible at the least number of mitigation sites. Due to the size of the proposed East Link Project, the variety of impacts on critical areas, and the complexity of identifying mitigation opportunities and satisfying the mitigation requirements, it may be necessary to use several sites and approaches to mitigation.

The existing conditions of each potential mitigation site would be used to develop an estimate of proposed mitigation value. The estimated mitigation value would inform the process of mitigation site selection and the value received for conducting mitigation at that site.

5.3.1 Conceptual Mitigation Framework

The expected impacts from the East Link Project that would occur in Bellevue would be within the Kelsey Creek subbasin, and the affected areas that drain to Mercer Slough/Lake Washington. It is possible that one mitigation site could be used to compensate for all wetland impacts related to Segments B, C, and D. The expected impacts within Segment E in Redmond would be within the Lake Sammamish subbasin.

Permanent impacts on wetlands could be mitigated by one or more of the following approaches, which are described in the text that follows:

- King County In-Lieu Fee Program
- Approved Mitigation Bank
- Project-specific mitigation developed by Sound Transit
- Also, Sound Transit would consider opportunities to establish mitigation in advance of the impacts from future construction of East Link Project. Advance mitigation is a form of permittee-responsible compensatory mitigation performed in advance of a permitted impact (USACE et al., 2010)

5.3.1.1 King County In-Lieu Fee Program (Mitigation Reserves Program)

King County is in the process of developing an in-lieu fee program called the Mitigation Reserves Program (King County, 2010). The program includes service areas for the Cedar River-Lake Washington and Lake Sammamish basins. This program should be available by the time the East Link Project is ready for permitting. However, many questions are unanswered at this time. Sound Transit would discuss this program with the Cities of Bellevue and Redmond to determine whether this could be applicable to the East Link Project or not.

5.3.1.2 Approved Mitigation Bank

There are no existing approved mitigation banks in the Kelsey Creek subbasin. However, it is possible that a bank could become certified in the project study area in the future. However, mitigation banking projects take considerable lead time for planning and approval.

5.3.1.3 Project-Specific Mitigation Developed by Sound Transit

Recent guidance developed by Ecology (Hruby et al., 2009) recommends the implementation of a watershed approach to selecting mitigation sites. This approach allows for a greater degree of flexibility in selecting mitigation sites and potentially greater value created for the watershed than the previous regulatory focus of on-site mitigation.

Current potential sites under consideration for project-specific mitigation are described below.

Wetland Hydrology along Bellevue Way SE

Regarding the interception of groundwater by the retained cut proposed for *Preferred Alternative B2M*, Sound Transit is addressing this issue by designing a sealed system for the trackway where it is below groundwater to eliminate the need for draining groundwater and thereby preserving the wetlands. The sealed system would allow the water to continue to flow around the retained cut to the wetland. The retained cut along Bellevue Way SE would intercept flows from groundwater flowing into Mercer Slough wetlands from the west, but the retained cut would be sealed and allow for groundwater to flow below and around it and would continue to reach the wetlands. The primary sources of hydrology for the Mercer Slough wetlands are the controlled water fluctuation of Lake Washington; input from Kelsey Creek and other small drainages; groundwater from the hill slopes to the west and east of Mercer Slough wetlands and culverts that enter these wetlands from the north, west, and east sides; and precipitation. As a result, no impact on hydrology of the Mercer Slough wetland is expected.

Wetland and Buffer Restoration at 112th Avenue SE and Mercer Slough West

The Watershed Company (2008b) prepared design drawings for the Wetland and Buffer Restoration at 112th Avenue SE and Mercer Slough West (see Exhibit 5-1) for the City of Bellevue Department of Parks and Community Services. This site would potentially enhance

EXHIBIT 5-1
View of Existing Potential Wetland and Buffer Restoration Area at 112th Avenue SE and Mercer Slough West

a narrow fringe of wetland along the west side of Mercer Slough West. The site would provide substantial stream (riparian), wetland, and shoreline buffer enhancement.

An advantage of this site is that a preliminary design and use agreement with the private landowner already exists. Bellevue Parks Department is interested in implementing this restoration project, but put it on hold when they learned that construction of the East Link route in Segment B could disturb this area.

Implementing this restoration project would be a logical consequence of restoring the temporary construction impacts in this area with direct benefits to wetlands and Mercer Slough West. Acquisition may not be needed to implement this restoration project. Wetland re-establishment would not likely result at this site, and therefore, would not contribute toward meeting Sound Transit's commitment of no-net-loss of wetland area.

Bel-Red / Springs District

West Tributary to Kelsey Creek

The West Tributary to Kelsey Creek site includes two parcels in the Springs District that the City of Bellevue acquired in Fall 2009 with funding from King County. This fits into Bellevue's planned Bel-Red vision for a restored West Tributary to Kelsey Creek with new community and neighborhood parks and public trail (City of Bellevue, 2010b) (see Exhibit 5-2).

Sound Transit would consider partnering with Bellevue to develop a restoration plan for these parcels that could occur concurrently with or in advance of the proposed light rail through this area. Unlike the 112th Avenue SE and Mercer Slough West site, this site could likely provide wetland re-establishment and therefore would contribute toward meeting Sound Transit's commitment of no-net-loss of wetland area. Acquisition may not be needed to implement this restoration project.

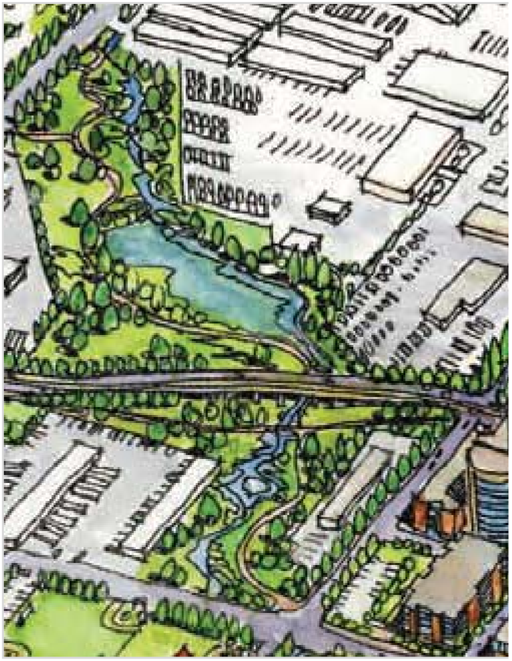

EXHIBIT 5-2
City of Bellevue's Conceptual Future Vision of West Tributary to Kelsey Creek in the Bel-Red area (City of Bellevue, 2010)

Goff Creek

Sound Transit met with the City of Bellevue to discuss impacts and mitigation for various aspects of the East Link Project and discussed the culvert lengthening of the Unnamed Tributary to Kelsey Creek. Sound Transit will continue to coordinate with the City of Bellevue to find and develop instream habitat improvements on Goff Creek in coordination with the City of Bellevue's larger plans to restore and daylight the creek.

Sound Transit East Link: Archaeological Survey Strategy of Preferred Alternative for FEIS and Project Design

Submitted to	Submitted by
CH2M Hill	**Historical Research Associates** Gail Thompson, Ph.D. Jennifer Gilpin, M.A.
Bellevue, Washington	Seattle, Washington

January 13, 2010

This report was prepared by HRA Principal Investigator Gail Thompson, Ph.D., and HRA Research Archaeologist Jennifer Gilpin, M.A., who meet the Secretary of the Interior's professional qualifications standards for archaeology. This report is intended for the exclusive use of the Client and its representatives. It contains professional conclusions and recommendations concerning the potential for project-related impacts to archaeological resources based on the results of HRA's investigation. It should not be considered to constitute project clearance with regard to the treatment of cultural resources or permission to proceed with the project described in lieu of review by the appropriate reviewing or permitting agency. This report should be submitted to the appropriate state and local review agencies for their comments prior to the commencement of the project.

1.0 Overview to FEIS Survey Strategy

In response to the Department of Archaeology and Historic Preservation's (DAHP) comment on the 2008 Draft EIS requesting additional archaeological survey, HRA has developed an expanded the cultural resources survey strategy to identify potential prehistoric and historical archaeological sites along the preferred alternative for East Link. To develop the survey strategy, HRA used information gathered about known archaeological resources and the patterns of prehistoric, ethnographic, and historic use of the area, along with the results of the previous cultural resources assessment, which was conducted in advance of the Draft EIS (DEIS) (Thompson et al. 2007). Archaeological field survey is intended to target a reasonably representative sample of the Project's preferred alternative. HRA intends to include a systematic examination of a number of parcels, concentrating on high probability areas, but also including some lower probability areas; some open and undeveloped areas; more developed, urbanized areas; and some public and private ownership areas, within the APE of the preferred alternative.

Project archaeologists first identified areas of greater or lesser archaeological probability by reference to models developed by HRA for the East Link Project, and by the DAHP. Section 2.0 provides a brief summary of these sensitivity models, their origin, and how they were utilized in developing the survey strategy.

HRA initially examined Sound Transit's lists of potential locations for geo-technical exploratory borings, in Project Segments A through D, to determine if the drilling equipment could impact high probability areas, which should be included in the survey. The methods used in this process are outlined in Section 3.0. Concurrently, the archaeological team selected a number of survey tracts, largely in high probability areas, but also in moderate- to low-probability areas. Section 4.0 includes a description of the methods used to select these tracts for archaeological survey.

Due to varying accessibility in terms of ownership and development (which often results in paved ground surfaces), the archaeologists propose to examine the survey tracts in two stages. The Stage 1 archaeological survey will occur as part of the Final EIS. Stage 1 tracts are:

- highly sensitive, archaeologically;
- largely publicly accessible (i.e., owned by the Cities of Bellevue or Redmond [Cities], King County, or Washington Department of Transportation [WSDOT]); and
- mostly unpaved and not covered by a hard surface.

Figures 1 through 4 (Appendix A) depict 11 areas for Stage. Based on information from this survey, a second pre-construction survey (Stage 2) would be prepared, refined and implemented. Survey tracts associated with Stage 2 are outside of public ownership, or are paved or otherwise less accessible at the time of Final EIS preparation. Portions of several Stage 1 tracts extend onto private property, and these portions will be noted and potentially surveyed in Stage 2. As Sound Transit acquires parcels for the project to be built, which will occur after the issuance of FEIS and Record of Decision (ROD), Stage 2 would be implemented. Information gathered from these surveys will inform the preparation of the Archaeological Resources Monitoring and Treatment

Plan (ARMT). Section 5.0 outlines the methods of archaeological inquiry that HRA proposes to utilize in Stage 1 and 2.

2.0 Archaeological Sensitivity Models

HRA's archaeological predictive model, developed for the Draft EIS, defines areas as having either high or low sensitivity for prehistoric and historical archaeological materials. HRA's sensitivity model was based on local environmental and cultural variables, assisted by a windshield survey in confirming areas of varying environmental characteristics. Environmental variables taken into account included slope, topographic position, distance to permanent water sources/channels, and vegetation ecotone, while cultural variables included locational and land-use information gleaned from ethnohistoric information on Native American use of the area (e.g., Hilbert et al. 2001) and historic-period maps (e.g. General Land Office [GLO] plats and Sanborn Fire Insurance maps). Figures 1 through 4 (Appendix A) show the areas of high sensitivity in Segments B through E, as recommended by HRA. Segment A is not included because it consists primarily of the highly developed Interstate 90.

The DAHP's archaeological predictive model, prepared for their use by GeoEngineers, used standardized and repeatable statistical methods (Bayesian and Kriging) with statewide environmental and cultural resources data. Data on geology, soils, landform, and information gleaned from historic-period GLO plats, were correlated with locations of known archaeological sites to "…determine the probability that, under a particular set of environmental conditions, another location would be expected to contain an archaeological site." (Kauhi and Markert 2009:2-3)

DAHP's model combines local information from field surveys to identify locations with five resulting sensitivity management groups: Very High (5), High (4), Moderate (3), Low (2) and Very Low (1). These were refined for management purposes, with groups (1) and (2) Archaeological Survey Contingent upon Project Parameters, group (3) Archaeological Survey Recommended; and groups (4) and (5) Archaeological Survey Required.

3.0 Selection of Geotechnical Boring Locations for Archaeological Survey

As part of preliminary engineering for the project's FEIS, geotechnical borings will be conducted for the project. The borings will assess general subsurface soil and groundwater conditions. The borings measure up to 8 inches in diameter and can extend from 50 to 200 feet deep. HRA has determined that these borings would provide relatively little useful archaeological data because of the methods that are used in drilling. As a result, FTA proposed and DAHP concurred that no archaeological monitoring would be conducted during this exploratory work. However, HRA has reviewed available information and recommends "pre-excavation archaeological surveys" to be conducted on three boring locations. Survey of these borings will be included as part of Stage 1. The methods and results for selecting the three borings are described below.

3.2 Methods

Several sources of information were examined during the selection process, pertaining to potentially sensitive boring locations. HRA archaeologists first examined archaeological sensitivity maps of the Project APE developed for the DEIS (see Section 2.0, above), comparing these data with GIS maps showing the locations of proposed bore holes plotted on an aerial photograph background. HRA then utilized a table which outlined the identification (i.e., designation), locations, and several additional characteristics of each proposed boring. These characteristics included: proposed depth overall, depth to a hard (i.e., glacial, bedrock) surface, whether the bore would be placed on pavement or grass, and the potential for disruption of traffic.

HRA used these three documents, in combination with the results of HRA's previous archaeological survey for the Project, to winnow the list of potentially sensitive probe locations to those for which HRA would propose a pre-drilling archaeological survey. The major concern at this point in the process is that the act of drilling itself (e.g., moving equipment, storage) could impact an unknown and unrecorded archaeological site. This would most likely occur on a soft surface, such as grass, that has not previously received an archaeological survey.

As a final cross-check, to potentially further refine boring locations, HRA examined the data for eight geotechnical borings excavated for the Project DEIS (Jacobs Associates 2007) and 18 previously-excavated borings along the Project alignment in Segment B (http://geomapnw.ess.washington.edu/index.php?toc=maintoc&body=services/onlinemap/main.htm). The eight borings described by Jacobs Associates (2007: Appendix A) are all located in Segment C, and were therefore of low relevance in developing the survey strategy. However, 18 bores – the results of which are available on the website operated by the Pacific Northwest Center for Geologic Mapping Studies – were drilled in the direct vicinity of the Project alignment in Segment B.

The high-sensitivity boreholes chosen by HRA are located in Segments B, C, and D. Segment A was not included because it consists largely of Interstate 90, and no borings are presently planned for Segment E. The selected borehole locations are:

- Located in the previously-mapped zones of higher archaeological sensitivity;
- Proposed to be excavated on a grassy surface. This narrowed down the probe locations to several in Segment B, with none in Segments C or D, in which the borings in sensitive areas, archaeologically, are proposed to be drilled on pavement;
- Situated on as little estimated fill depth as possible. This step eliminated several probes that are located close to the I-90 on/off ramps to Bellevue Way SE; and
- Located outside of HRA's previously-surveyed tracts of Segment B.

Appendix B includes a table, narrowing down to the most sensitive boring locations and providing rationale for why several were not selected for archaeological survey.

3.3 Results

Table 1 lists the locations and relevant characteristics of the borings proposed for pre-excavation archaeological survey. These locations (shown in Figure 1) will be surveyed as a part of Stage 1 archaeological investigations of the Project APE. As was mentioned above, portions of several Stage 1 tracts extend onto private property. All geotechnical boring locations are located within larger proposed Stage 1 Survey Tract 5.

Table 1. Geotechnical Boring Locations Selected by HRA for Survey and Probing Pre-Drill.

4.0 Methods for Survey Tract Selection

HRA created a color-coded priority system to aid in the selection of archaeological survey tracts. The process of prioritizing was undertaken with reference to the HRA and DAHP sensitivity models, and by taking into account perceived local ground disturbance. Table 2 outlines this color-based priority system, with the general guidelines applied by HRA while coding each proposed survey segment. Based on this method, 11 tracts were identified for Stage 1 survey (Appendix C). Additional tracts were also identified using this method. However, because there are uncertainties about the project, including the fact that the FEIS and ROD have yet to be issued, and the final corridor has yet to be selected, this report does not include a full description of the Stage 2 tracts.

Table 2. Description Of Colors Used To 'Code' HRA Proposed Final EIS Survey Tracts

Flag Color	HRA Sensitivity (Approximate)	DAHP Sensitivity (Approximate)	Additional Factors
Red	High	5 (Survey Highly Advised: Very High Risk) Can be 4 Survey Highly Advised: High Risk)	Generally, fewer disturbances seen (i.e., vegetated), but largely a factor of very high sensitivity.
Yellow	High	5 (Survey Highly Advised: Very High Risk) 4 Survey Highly Advised: High Risk) Can be 3 (Survey Recommended: Moderate Risk)	Generally showing more developed and/or paved surfaces, but still recommended for survey due to high sensitivity
Green	Low	4 Survey Highly Advised: High Risk) 3 (Survey Recommended: Moderate Risk) Can be 2 (Survey Contingent Upon Project Parameters: Moderately Low Risk)	Generally, fairly developed and/or paved surfaces; some moderate risk. These can be used as control or comparison areas for lower probability
Blue	Low	2 (Survey Contingent Upon Project Parameters: Moderately Low Risk) 1 (Survey Contingent Upon Project Parameters: Low Risk)	Generally, very developed and/or disturbed, with lowest archaeological sensitivity

HRA coded the proposed tract as "Red" when both sensitivity models classified the area as "High" to "Very High" risk, and it appeared (using aerial photographs) that the vicinity showed few obvious disturbances (i.e., much of the area shows vegetation). "Yellow" survey tracts are those with generally high sensitivity (HRA and/or DAHP), but usually with increased disturbance; for instance, development or paved surfaces. HRA coded tracts as "green" when, (a) archaeological probability was high to moderate (generally, by the DAHP's model) and predicted disturbances were quite extensive, or (b) archaeological probability was more moderate, but fewer disturbances were evident while examining aerial photographs of the alignment. "Blue" survey tracts are those in low-probability areas for archaeological resources, and they are, generally, also perceived to be at least moderately impacted by development. This color coding system was then used as a basis for assigning proposed survey tracts to Stage 1 and 2 as described below.

Based on HRA’s color-coded priority system, 11 tracks have been identified for survey as part of the FEIS because these are:

- Identified as high probability for archaeological resources under both HRA and DAHP models;
- Mostly owned by a public agency; and

- Not paved or otherwise readily accessible.

Based on the information gained from Stage 1 research and archaeological investigations, including as geotechnical borings, and after the Final EIS and ROD have been issued, a second pre-construction survey plan (Stage 2) would be refined and implemented. Stage 2 tracts are outside of public ownership or are paved or otherwise less accessible at the time of Final EIS preparation. Portions of several Stage 1 tracts extend onto private property (for example, in Segment B), and these portions will be noted and potentially surveyed in Stage 2.

5.0 Staged Archaeological Survey

5.1 Stage 1 Archaeological Survey Methods

The goal of Stage 1 survey is to provide additional information about areas of high archaeological sensitivity. Therefore, more emphasis is placed in Segments B and E than other segments with less sensitivity. HRA selected 11 tracts for archaeological survey in Stage 1: the first 7 are located in Segment B and the remaining 4 are located in Segment E. Figures 1 through 4 (Appendix A) depict areas for Stage 1 survey overlaid on DAHP and HRA sensitivity model results. In addition, three locations associated with the drilling of geotechnical borings are proposed for Stage 1 survey, based on the location and surface characteristics (see Section 3.2 above) of these borings. All boring locations are situated within larger proposed Stage 1 Survey Tract 5; however, these borings are located on private property in these tracts, and additional permits will be required prior to archaeological survey. The table presented in Appendix C provides details regarding the proposed Stage 1 survey tracts.

Stage 1 work will be divided into three tasks: Stage 1a will consist of rechecking GLO maps, and examining available historical topographic maps, to compare the historical and modern topographic features of survey tracts. This will help verify sensitive landforms, such as stream terraces, and will identify areas where historical disturbance has altered the landform. Stage 1b will consist of a windshield examination of the survey tracts to verify sensitivity characteristics, as well as aspects of the survey tracts identified during their selection and Stage 1a review. It is possible that the Stage 1a and 1b work may drop some tracts from the Stage 1a field survey.

The cultural resources field survey in Stage 1c will be accomplished by the use of systematic pedestrian transects performed at intervals not exceeding 20-meter (m) (66-foot [ft]). The field director will take into account local disturbances, topography, and field conditions (i.e., large amounts of fill or other recent disturbances, standing water) to determine where the archeologists will excavate auger or shovel probes, or other standard manual excavation techniques. These will also be placed at about 20-m (66-ft) intervals, down to sterile materials or about 2 m (7 ft) depth (depending on the vertical depth for the APE in each survey area).

Excavated matrix will be screened through ¼-inch mesh and examined for prehistoric- and historic-period artifacts. Cultural items found will be documented on HRA shovel probe forms and, if diagnostic, by digital photography, before being returned to the excavated hole; no artifacts will be collected.

The sediments observed in each positive probe hole will be described on the shovel probe form and in the field director's field notes, including evidence of subsurface disturbances and cultural material integrity. The shovel probes will be immediately backfilled following their termination and recording, and the turf will be replaced, as appropriate.

Included in the above-described regimen of strategic shovel probes are three locations where Sound Transit plans to drill geotechnical borings (Table 1, above). Prior to the borings, HRA proposes to examine the grassy (or otherwise unpaved) ground surface surrounding these drill locations, and to excavate a shovel probe at the approximate drill location, to determine if the drilling (including the movement of drill-related machinery) will disturb an unrecorded archaeological site.

The location of survey transects and shovel probes will be recorded using a handheld Trimble® Global Positioning System (GPS) unit loaded with ArcGIS® software. Prehistoric and historical archaeological isolates and sites that are discovered during the Stage 1c survey will be mapped, photographed, and recorded using Washington Archaeological Isolate and Site Inventory forms. During Stage 1, HRA will conduct a preliminary assessment of each archaeological site encountered regarding its eligibility for inclusion in the National Register of Historic Places (NRHP); however, depending on the perceived integrity of the site, HRA may recommend additional testing (to be conducted at a later phase).

The information on local sediments and disturbances gathered by HRA during Stage 1c archaeological survey will be used to inform, and potentially refine, survey locations and strategy during the Final EIS archaeological assessment. A summary report will be prepared as a result of Stage 1, describing findings and results. The summary report will include recommendations for refining Stage 2 archaeological work.

5.2 Stage 2 Archaeological Survey Methods

Based on findings of Stage 1 and after the Final EIS and ROD have been issued, a more detailed archaeological survey plan will be developed for Stage 2, in consultation with DAHP. Stage 2 archaeological survey will be implemented during the Final Design and before project construction starts. Stage 2 tracts are areas of archaeological sensitivity (based on DAHP and HRA's models) and where hardened surfaces or deeper fill will need to be removed with mechanical equipment prior to archaeological survey. Portions of Stage 1 tracts that extend onto private property may also be included in Stage 2 survey. The Stage 2 survey is anticipated to take place as such tracts become available for work. Results of Stage 2 work would provide guidance as Sound Transit prepares the Archaeological Monitoring and Treatment Plan.

In several areas, most notably the vicinity of Mercer Slough in Segment B, and the Sammamish River and Bear Creek in Segment E, HRA proposes that mechanical test pits (TPs) be excavated at selected intervals. The depositional environment in these locations is alluvial, and, as such, archaeological sites may be more deeply buried than on the surrounding topography (formed in compacted glacial till and outwash). A precedent for using the mechanical excavation method locally was set during Northwest Archaeological Associates' (NWAA) 2008 cultural resources assessment for proposed rehabilitation of Lower Bear Creek in Redmond (northeast of the confluence of Bear Creek with the Sammamish River). During this project, cultural materials, likely dating to several thousand years old, were observed below silty, clayey 'diatomaceous' earth, in association with deposits of peat, at 4.3 to 5.9 ft (1.3 to 1.8 m) below surface (Hodges et al. 2009).

In the vicinity of Mercer Slough, the Sammamish River, and Bear Creek, where cultural materials may be buried more deeply than can be reached using hand excavation, HRA recommends following the proposed regimen of shovel probes with the excavation of mechanical test pits (TPs) and, as required, backhoe trenches (BT) along the preferred alternative. Test pits will be dug by a backhoe equipped with a 3- to 4-ft (1- to 1.2-m) bucket, measuring approximately 10 ft (3 m) long, and initially excavated to a depth at which cultural deposits are observed, or a depth of 4 ft (1.2 m) – generally, this is the accepted trench depth in which an individual can work without additional benching or shoring of the side walls (according to the Occupational Safety and Health Administration [OSHA]). At this point, the wall profiles will be cleaned and examined, soils will be described, and the pit will be recorded by the monitoring archaeologist (both long walls photographed and sketched). Excavation will continue until cultural deposits are observed, until sterile sediments (i.e., glacial outwash or till) are reached, or as deeply as feasible. As long as a cultural layer is not reached, the monitoring archaeologist will continue to record the characteristics and depths of excavated sediments as clearly as feasible, examining back dirt, as it is removed, for the presence of potentially cultural horizons and archaeological materials. Archaeological equipment will include, as appropriate, a shovel, trowel, and screens of 1/4- and 1/8-inch mesh.

A backhoe will be used to remove layers of asphalt, concrete, and potentially fill, in targeted locations within the proposed survey tracts. Once hardened surfaces and fill sediments are removed, initially only to a depth of 4 ft (1.2 m) (to meet OSHA standards), shovel probes may be placed within excavated trenches. The procedures for pedestrian transects and shovel probing outlined for Stage 1c will also apply to those areas surveyed in the Stage 2 archaeological investigation. Samples for tephra analysis and/or radiocarbon dating will be collected, as appropriate, during Stage 1 and later stage archaeological investigations, upon the discovery of cultural materials and/or features within any archaeological sites in the APE.

Appendix B
Rationale for Selecting Geotechnical Boring Locations

Most Sensitive Boring Locations
Sound Transit Eastlink Project

Sound Transit, East Link, Proposed Segments A through D Exploration Plan for 100% Design													
Modified for HRA:	**16-Oct-09**	**(J. Gilpin)**											
🟨	Grassy or vegetated surface: shallow undiscovered resources may be damaged by equipment												
🟧	Grassy surface, but: likely fill (i.e., close to highway) or possibility to park on nearby paved?												
🟥	Possibility for Pre-Drill Survey (grassy surface and NOT in previous HRA survey tract)												
Segment	**Structure Name/ID**	**Exploration Number (shown on maps)**	**Planned Depth (feet)**	**Purpose**	**Archaeological Observations/Comments**	**Est. Depth to V. Dense (feet)**	**Days to Complete Drilling**	**Surface**	**Color Code Explanation**	**Est Rig Type**	**Exploration Locaton**	**Traffic Control?**	**Piezometer & Special Testing**
Segment B	Elevated Structure/ ES	B-B-ES-1DST	200	New information	Near highway	20?	3	Grass	At highway interchange: likely fill	Truck or track	WSDOT ROW	Limited	Downhole Seismic
Segment B		B-B-ES-2p	150	New information	Near highway	20?	3	Grass	At highway interchange: likely fill	Truck or track	WSDOT ROW	Limited	Piezo
Segment B		B-B-ES-3p	100	New information	Near highway	20?	2	Grass	Between highway offramp and surface	Truck or track	WSDOT or City of Bellevue ROW	Limited	Piezo
Segment B		B-B-ES-7	100	New information	In Survey Tract 2: historic-period artifacts to 32 cmbs (high water table)	20?	1.5	Grass	Far off-paved	Truck	City of Bellevue ROW	Limited	NO
Segment B		B-B-ES-9p	120	New information	Possibility for pre-bore check - north of obviously disturbed park and ride, but looks to be near residence	30?	2.5	Grass NOW IN PARKING LOT	Off paved area	Truck	City of Bellevue ROW	Limited	Piezo
Segment B		B-B-ES-11p	120	New information	In Survey Tract 3: appears to be largely modern 'artifacts' in nearby shovel probes to 80 cmbs (so likely disturbed and/or fill)	40?	2.5	Vegetated	Far off-paved	Track	City of Bellevue ROW	Limited	Piezo
Segment B		B-B-ES-12p	120	New information	Possibility for pre-bore check - immediately to west of Mercer Slough West	40?	2.5	Grass	Off paved area? May park on paved	Truck or Track	CITY PARK? (was classified as City of Bellevue ROW)	Limited	Piezo
Segment B		B-B-ES-13p	120	New information	In Survey Tract 4: described as fill to 60 cmbs	40?	2.5	Grass	Off paved area? May park on paved	Truck or Track	City of Bellevue ROW	YES	Piezo
Segment B		B-B-BPR-2p	100	New information	In Survey Tract 2: historic-period artifacts to 32 cmbs (high water table)	20?	2	Grass	Far off-paved	Truck	City of Bellevue ROW	Limited	Piezo
Segment B		B-B-BPR-7p	100	New information	Appears to be in immediate vicinity of park-and-ride (turf and possible fill)	20?	2	Grass	Off paved area? May park on paved	Truck	WSDOT ROW	Limited	Piezo
Segment B		B-B-BPR-9p	100	New information	Appears to be in immediate vicinity of park-and-ride (turf and possible fill)	20?	2	Grass	Off paved area? May park on paved	Truck	WSDOT ROW	Limited	Piezo

Most Sensitive Boring Locations
Sound Transit Eastlink Project

Segment	Structure Name/ID	Exploration Number (shown on maps)	Planned Depth (feet)	Purpose	Archaeological Observations/Comments	Est. Depth to V. Dense (feet)	Days to Complete Drilling	Surface	Color Code Explanation	Est Rig Type	Exploration Locaton	Traffic Control?	Piezometer & Special Testing
Segment B	At-Grade or Retained Fill/ AG	B-B-AG-1p	120	New information	Possibility for pre-bore check - north of park and ride	40?	2.5	Grass or Pavement		Truck or Track	CITY PARK? (was classified as City of Bellevue ROW)	Limited	Piezo
Segment B		B-B-AG-2	120	New information	Possibility for pre-bore check - approaching Fredrick W. Winters House	40?	2	Grass NOW IN PARKING LOT		Truck or Track	City of Bellevue ROW	Limited	NO
Segment B		B-B-AG-3p	120	New information	Possibility for pre-bore check - approaching Fredrick W. Winters House	40?	2.5	Grass NOW IN PARKING LOT		Truck or Track	City of Bellevue ROW	Limited	Piezo
Segment B		B-B-AG-5p	120	New information	Possibility for pre-bore check - immediately to west of Mercer Slough West	40?	2.5	Grass	Off paved area? May park on paved	Track or Truck	NOW PRIVATE PROPERTY (was classified as City of Bellevue ROW)	Limited	Piezo
Segment B		B-B-AG-6p	120	New information	Possibility for pre-bore check - immediately to west of Mercer Slough West	40?	1.5	Grass	Off paved area? May park on paved	Track or Truck	NOW PRIVATE PROPERTY (was classified as City of Bellevue ROW)	Limited	Piezo

Appendix C
Stage 1 Survey Tract Table

HRA Proposed Stage 1 FEIS Archaeological Survey Tracts

Map Sheet*	FEIS First Stage Designation	HRA Designation	HRA Probability	Color Code	DAHP Probability**	Approx. Length (feet/ meters)	Approx. Width (feet)	Approx. Area (acres)	Parcel ID (on map - see Map Sheet designation)	Parcel ID (assessor parcel)	Ownership	Survey Method***	Approx. # of SPs (at ~25-m intervals): Stage 1	Survey ahead of Geotechnical Boring?	Comments	Estimated Accessibility
14 (2009 All)	1	HRA B3S-3	High	Red	5	500/ 152	80	0.9	Unknown	Unknown	City of Bellevue?	SP?; trench?	6		Just to side of Bellevue Way. Trenching may be necessary in this and subsequent survey tracts along Segment B alignment due to the presence of peat	Good
16 (2009 All)	2	HRA B3S-4	High	Red	5	300/ 92	100	0.7	2152	7000100360	WSDOT	SP; trench?		5	New(?) area just east of Park and Ride - possibly equipment storage?	Good
16 (2009 All)	3	HRA B3S-5	High	Red	5	400/ 122	80	0.7	2259	824059278	City of Bellevue Parks	SP; trench?	5		To north of Park and Ride, looks vegetated. Borings will tell us more about this area (i.e., how much fill)	Good
16 (2009 All)	4	HRA B3S-6a	High	Red	5	200/ 61	80	0.4	2295	524059254	City of Bellevue Parks	SP; trench?	3		To north of Park and Ride, looks vegetated. Borings will tell us more about this area (i.e., how much fill). Width can be cut down to 50 ft if necessary	Good
16, 18 (2009 All)	4	HRA B3S-6b	High	Red	5	1,200/ 366	80	2.2	2358	524059084	City of Bellevue Parks	SP; trench?	15	Yes - survey and SP at Soil Boring B-B-AG-1p	Looks vegetated - and survey as much as possible. Some places will not be feasible, i.e., around Winters House. Borings will tell us more about this area (i.e., how much fill). Width can be cut down to 50 ft if necessary	Good
18 (2009 All)	4	HRA B3S-6c	High	Red	5	500/ 152	80	0.9	2404	662870090	City of Bellevue Parks	SP; trench?	6		Looks vegetated. Borings will tell us more about this area (i.e., how much fill). May extend into City of Belleuve Road parcel at west edge	Good
18, 20 (2009 All)	5	HRA B3S-7	High	Red	5	1,200/ 366	100	2.7	Unknown and 4035	Unknown and 066288TRCT	City of Bellevue? TRCT is unavailable	SP; trench?	15	Yes - survey and SP at Soil Borings B-B-AG-5p, B-B-AG-6p, and B-B-ES-12p	ROW widens slightly here. Surface appears vegetated. Borings will tell us more about this area (i.e., how much fill). Previous HRA survey tract 3 just to south of this proposed survey area - HRA observed some disturbance in upper levels, and two shovel probes saw peat-like lens starting between 20 and 60 cmbs.	Good
20 (2009 All)	6	HRA B3S-8a	High	Red	5	600/ 183	100	1.4	Unknown and 4061	Unknown and 066288TRCT	City of Bellevue? TRCT is unavailable	SP; trench?	10		ROW widens slightly here. Surface appears vegetated. Borings will tell us more about this area (i.e., how much fill).	Good
25 (PA Map)	7	HRA D2A-4	High	Red	4	250/ 76	80	0.5	2825059296, 2825059240	2825059296, 2825059240	City	SP; trench?	3		Covers the proposed D2A ROW surrounding a ponded portion of 'West Tributary' Kelsey Creek. Assumes that the 'retained cut' D2A route is not chosen	Good to Moderate (Likely high water table here)
32, 33 (PA Map)	8	HRA E2-3	Low into High	Green	4	2200/ 67	80	4	Unknown (roads); 943530UNKN, 9435300123, 5422560680, 5422560670, 5422560660, 5422560650, 5422560640	Unknown (roads); 943530UNKN, 9435300123	WSDOT (road, 0123) and City of Redmond (road?); unknown (UNKN); remainder private	SP; trench?	27		Vegetated area north of NE 60th St and along SR 520. Portions appear less visibly disturbed than vicinity, and likely will target these portions of this stretch, based on field observations	Good to Moderate
34 (PA Map)	9	HRA E2-4	High	Red	5	500/ 152	80	0.9	Unknown (SR 520, W Lake Sammammish)	Unknown (SR 520, W Lake Sammammish)	WSDOT, City of Redmond	SP; Trenches	6		Vicinity of Sammammish River. Paleo archy site within ~600 ft NE of this location. Deep trenching, if possible, for elevated route. Possible SPs, especially closer to the river	Poor at highway; Moderate to Good closer to River

Map Sheet*	FEIS First Stage Designation	HRA Designation	HRA Probability	Color Code	DAHP Probability**	Approx. Length (feet/ meters)	Approx. Width (feet)	Approx. Area (acres)	Parcel ID (on map - see Map Sheet designation)	Parcel ID (assessor parcel)	Ownership	Survey Method***	Approx. # of SPs (at ~25-m intervals): Stage 1	Survey ahead of Geotechnical Boring?	Comments	Estimated Accessibility
34 (PA Map)	10	HRA E2-5a	High	🟥 Red	5	1450/ 442	80	2.7	Unknown (SR 520), 1125059016, 1125059037	Unknown (SR 520), 1125059016, 1125059037	WSDOT (SR 520); King County (Marymoor Park)	SP; Trenches	18		Elevated track here. Vicinity of Sammammish River and Bear Creek. Paleo archy site within ~400 ft N of this location. Deep trenching, if possible, depending on APE depth due to elevated route. Systematic SPs, especially closer to the river, and depending on levels of fill. No boring locations planned at this time for this location	Good to Moderate
34, 35 (PA Map)	10	HRA E2-5b	High	🟥 Red	5	1800/ 549	80	3.3	Unknown (SR 520); 1125059037	Unknown (SR 520); 1125059037	WSDOT (SR 520); King County (Marymoor Park)	SP; Trenches	22		At-grade track here. Vicinity of Sammammish River and Bear Creek. Deep trenching, depending on depth of APE. Systematic SPs and depending on levels of fill (previous HRA Survey Tract 16 to East showed historic fill). No boring locations planned at this time for this location	Good to Moderate
36 (PA Map)	11	HRA E2-7	High	🟨 Yellow	5	600/ 183	80	1.1	Unknown	2439705555	Unknown (WSDOT?); King County owns RR ROW	SP; trench	8		Approaching and along RR ROW (owned by King County) in 'retained cut'. May be able to trench and place shovel probes along edges of RR ROW. Since retained cut, and approaching Bear Creek, should plan to trench as move west	Poor to moderate (close to highway)
37 (PA Map)	11	HRA E2-8	High	🟥 Red	5	1100/ 335	80	2	1225059266, 1225059265	1225059266, 1225059265	King County (9265); BNSF (9266)	SP; trench	13		Short 'retained cut' and then elevated over Bear Creek. Need to plan for systematic probing and likely trenching in this segment, particularly around Bear Creek	Good to moderate (BNSF)

TABLE B-1
Summary Information on Archaeological Shovel Probes

Alignment Segment	Test Area	Probe	Maximum Depth (cmbs)	Soil Description	Cultural Materials Identified
B	1	SP 1-1	41	0-15 cmbs:10YR 4/2 dark grayish brown sandy silty loam with 58% subrounded and subangular cobbles; 15-41 cmbs: 10YR 3/2 very dark grayish brown moist to saturated silt loam with < 5% subrounded pebbles with 1% subrounded cobbles. Terminated at 41 cmbs because of high water table	None
B	2	SP 2-1	30	0-10 cmbs thick duff layer; 10-30 cmbs highly compacted 10YR 5/1 gray clay with 2% subrounded pebbles and 3% cobbles, Terminated at 30 cmbs because of water table	None
B	2	SP 2-2	22	0-22 cmbs: 10YR 5/1 brown compact, wet silty clay, water table at 22 cmbs	None
B	2	SP 2-3	25	0-10 cmbs thick duff layer; 10-25 cmbs highly compacted 10YR 5/1 gray clay with 2% subrounded pebbles and 3% cobbles, Terminated at 25 cmbs because of water table	None
B	2	SP 2-4	27	0-12 cmbs thick duff layer; 12-27 cmbs highly compacted 10YR 5/1 gray clay with 2% subrounded pebbles and 3% cobbles, Terminated at 27 cmbs because of water table	None
B	2	SP 2-5	20	0-2 cmbs thick forest duff layer; 2-20 cmbs 10YR 3/2 very dark grayish brown silt loam, moist to saturated with <3% subrounded cobbles and gravels. Terminated at water table.	Two colorless glass bottle fragments
B	2	SP 2-6	25	0-2 cmbs thick forest duff layer; 2-25 cmbs 10YR 3/2 very dark grayish brown silt loam, moist to saturated with <3% subrounded cobbles and gravels. Terminated at water table.	None
B	2	SP 2-7	29	0-2 cmbs thick forest duff layer; 2-29 cmbs 10YR 3/2 very dark grayish brown silt loam, moist to saturated with <3% subrounded cobbles and gravels. Terminated at water table.	Milkglass, terra cotta fragment, orange brick fragment
B	2	SP 2-8	24	0-2 cmbs thick forest duff layer; 2-24 cmbs 10YR 3/2 very dark grayish brown silt loam, moist to saturated with <3% subrounded cobbles and gravels. Terminated at water table.	None
B	2	SP 2-9	27	0-2 cmbs thick forest duff layer; 2-27 cmbs 10YR 3/2 very dark grayish brown silt loam, moist to saturated with <3% subrounded cobbles and gravels. Terminated at water table.	None
B	2	SP 2-10	39	0-2 cmbs thick forest duff layer; 2-39 cmbs 10YR 3/2 very dark grayish brown silt loam, moist to saturated with <3% subrounded cobbles and gravels. Terminated at water table.	None
B	2	SP 2-11	40	0-2 cmbs thick forest duff layer; 2-40 cmbs 10YR 3/2 very dark grayish brown silt loam, moist to saturated with <3% subrounded cobbles and gravels. Terminated at water table.	None
B	2	SP 2-12	32	0-2 cmbs thick forest duff layer; 2-32 cmbs 10YR 3/2 very dark grayish brown silt loam, moist to saturated with <3% subrounded cobbles and gravels. Terminated at water table.	Undecorated white earthenware fragment
B	2	SP 2-13	25	0-2 cmbs thick forest duff layer; 2-25 cmbs 10YR 3/2 very dark grayish brown silt loam, moist to saturated with <3% subrounded cobbles and gravels. Terminated at water table.	None
B	2	SP 2-14	27	0-2 cmbs thick forest duff layer; 2-27 cmbs 10YR 3/2 very dark grayish brown silt loam, moist to saturated with <3% subrounded cobbles and gravels. Terminated at water table.	None

TABLE B-1
Summary Information on Archaeological Shovel Probes

Alignment Segment	Test Area	Probe	Maximum Depth (cmbs)	Soil Description	Cultural Materials Identified
B	2	SP 2-15	32	0-2 cmbs thick forest duff layer; 2-32 cmbs 10YR 3/2 very dark grayish brown silt loam, moist to saturated with <3% subrounded cobbles and gravels. Terminated at water table.	None
B	2	SP 2-16	40	0-2 cmbs thick forest duff layer; 2-40 cmbs 10YR 3/2 very dark grayish brown silt loam, moist to saturated with <3% subrounded cobbles and gravels. Terminated at water table.	None
B	2	SP 2-17	25	0-2 cmbs thick forest duff layer; 2-25 cmbs 10YR 3/2 very dark grayish brown silt loam, moist to saturated with <3% subrounded cobbles and gravels. Terminated at water table.	None
B	2	SP 2-18	23	0-2 cmbs thick forest duff layer; 2-25 cmbs 10YR 3/2 very dark grayish brown silt loam, moist to saturated with <3% subrounded cobbles and gravels. Terminated at water table.	None
B	2	SP 2-19	39	0-2 cmbs thick forest duff layer; 2-39 cmbs 10YR 3/2 very dark grayish brown silt loam, moist to saturated with <3% subrounded cobbles and gravels. Terminated at water table.	None
B	3	SP 3-1		0-2 cmbs thick forest duff layer; 2-25 cmbs 10YR 3/2 very dark grayish brown silt loam, moist to saturated with <3% subrounded cobbles and gravels. Terminated at water table.	None
B	3	SP 3-2		02 cmbs thick forest duff layer; 2-25 cmbs 10YR 3/2 very dark grayish brown silt loam, moist to saturated with <3% subrounded cobbles and gravels. Terminated at water table.	None
B	3	SP 3-3	85	0-5 cmbs duff layer; 20-50 cmbs very moist mottled 10YR 3/2 very dark grayish brown with 10YR 3/1 very dark gray moist silt loam with clumps of decaying vegetation; 50-85 cmbs 10YR 3/4 dark yellowish brown clayey silt with <1% subangular gravels	None
B	3	SP-3-4		2 cmbs thick forest duff layer; 2-25 cmbs 10YR 3/2 very dark grayish brown silt loam, moist to saturated with <3% subrounded cobbles and gravels. Terminated at water table.	None
B	3	SP 3-5	38	0-7 cmbs: sod layer; 7-38 cmbs: 10YR 2/2 to 10YR 2/1 very dark brown to black silty loam.	Glass fragments; possible broken utility pipe
B	3	SP 3-6	86	0-40 cmbs: loose 10YR 3/2 to 10Y 2/1 very dark grayish brown to black loam with roots and <1% subangular gravels; 40-45 cmbs: 10YR 4/3 brown slightly sandy loam with <1% subangular gravels; 45-86 cmbs: 10YR 4/2 dark grayish brown moist silt "peat-like" with chunks of decomposing vegetation	None
B	3	SP 3-7	92	0-17cmbs thick sod layer; 17-92 cmbs homogenous 10YR 3/2 very dark grayish brown silt loam with clumps of decomposed vegetation and 2% subrounded pebbles, some charcoal	None
B	3	SP 3-8	55	2 cmbs thick forest duff layer; 2-25 cmbs 10YR 3/2 very dark grayish brown silt loam, moist to saturated with <3% subrounded cobbles and gravels. Terminated at water table.	None
B	3	SP 3-9	44	0-5 cmbs organic layer 5-44 cmbs 10YR 2/1 black organic layer, mulch of decomposed plant remains mixed with silt.	None

TABLE B-1
Summary Information on Archaeological Shovel Probes

Alignment Segment	Test Area	Probe	Maximum Depth (cmbs)	Soil Description	Cultural Materials Identified
B	3	SP 3-10	80	0-80 cmbs: 10YR 6/3 pale brown silt loam with 5% subrounded pebbles	Brown glass fragment at 40 cmbs
B	3	SP 3-11	92	0-30 cmbs 10YR 4/2 dark grayish brown moist silty sand with 30% subrounded cobblees and pebbles; 30-60 cmbs 10YR 2/1 black crumbly silt loam with <10% subangular to subrounded pebbles, 60-92 cmbs 10YR 2/1 to 2/2 black to very dark brown "peat-like" organic layer with decomposing vegetation	None
B	3	SP 3-12	70	0- 70 cmbs organic layer; 9-40 cmbs 10YR 6/3 pale brown fine silty clay with subrounded to subangular pebbles to cobbles, 40 to 70 cmbs fine 10YR 4/2 dark grayish brown silty clay with 4% cobbles	None
B	3	SP 3-14	77	0-77 cmbs: 10YR 2/2 to 2/1 very dark brown to black organic silt loam with abundant decomposing vegetation and hard compacted clumps of 10YR 4/2 dark grayish brown sandy silt. Disturbed soils.	None
B	4	SP 4-1	62	0-62 cmbs: 10YR 5/3 brown silt loam with coarse sands and 5% cobbles, fill.	None
B	4	SP 4-2	57	0-57 cmbs: 10YR 5/3 brown silt loam with coarse sands and 5% cobbles, fill.	None
E	14	SP 14-1		0-74 cmbs: 10YR 5/3 brown silt loam with coarse sands and 10 % gravels to cobbles, fill.	None
E	14	SP 14-2	74	0-74 cmbs: 10YR 5/3 brown silt loam with coarse sands and 10 % gravels to cobbles, fill.	None
E	16	SP 16-1	82	0-11 cmbs: 10YR 4/3 brown powdery silt loam with some 10YR 5/3 brown mottling with 10% subrounded pebbles to cobbles; 22-70 cmbs: 10YR 5/2 grayish brown silt loam; 50-82 cmbs: 10YR 4/1 dark gray fine sandy silt. Historic fill	None
E	16	SP 16-2	70	0-3 sod layer; 3-50 cmbs: 10YR 3/2 very dark grayish brown silt with 7% subrounded pebbles some charcoal. Layer of broken glass at 25 cmbs, metal fragments at 30 cmbs; 50-70 cmbs: 10YR 4/1 dark gray fine sandy silt. Historic fill	Glass and metal fragments
E	16	SP 16-3	92	0-11 cmbs: sod layer; 10YR 5/3 brown silt loam with 10% gravels to pebbles; 11-26 cmbs: 10YR 5/1 brown silt loam with 10% subrounded pebbles to cobbles; 26-87 cmbs: 10YR 6/1 fine gray sand; 87-92 cmbs: 10YR 3/3 reddish brown loam with coarse, gritty sands	None
E	16	SP 16-4	97	0-5 cmbs: sod layer; 5-13 cmbs: 10YR 3/2 very dark grayish brown silt loam with 3% subrounded pebbles; 13-97 cmbs: 5YR 4/2 dark reddish gray very fine sandy silt with <1% subrounded pebbles. Some 10YR 5/6 to 10YR 4/6 yellowish brown to dark yellowish brown sandy silt	None
E	16	SP 16-5	82	0-5 cmbs: sod layer; 5-13 cmbs: 10YR 3/2 very dark grayish brown silt loam with 3% subrounded pebbles; 13-82 cmbs: 5YR 4/2 dark reddish gray very fine sandy silt with <1% subrounded pebbles.	None

TABLE B-1
Summary Information on Archaeological Shovel Probes

Alignment Segment	Test Area	Probe	Maximum Depth (cmbs)	Soil Description	Cultural Materials Identified
E	16	SP 16-6	95	0-12 cmbs sod layer; 12-45 cmbs 10YR 6/3 pale brown silt loam with glass fragments mixed throughout; 45-80 cmbs: 10YR 5/1 gray mottled with 10YR 3/6 dark yellowish brown sandy clay; 80-95 cmbs 10YR 5/3 brown sand with 70% subangular pebbles, fill.	Glass fragments
E	16	SP 16-7	102	0-7 cmbs: ; 7-29 cmbs: 10YR 5/2 grayish brown silt loam with 10% subrounded gravels ; 29-85: 10YR 5/1 fine gray sand; 85-102 cmbs: 10YR 3/3 reddish brown loam with coarse, gritty sands	None
E	16	16-8	120	0-5 cmbs: sod layer; 5-20 cmbs: 10YR 3/2 very dark grayish brown silt loam; 20-118 cmbs: 5YR 4/2dark reddish gray very fine sandy silt; 118-120 cmbs: 5YR 4/2 dark reddish gray very fine sandy silt mottle with 10YR 5/1gray coarse sands	None
E	16	16-9	115	0-8 cmbs: sod layer; 8-24 cmbs: 10YR 3/2 very dark grayish brown silt loam; 20-115 cmbs: 5YR 4/2 dark reddish gray very fine sandy silt	None

East Link Project

APPENDIX D

Winters House Construction Minimization and Avoidance Technical Memorandum and Landscape Report

APPENDIX D1

Winters House Construction Minimization and Avoidance Technical Memorandum

MEMORANDUM CH2MHILL

Sound Transit, East Link Project

Construction of Transit Corridor in Proximity to Winters House Foundation

TO:	Jodi Ketelsen/CH2M HILL
FROM:	Green, Ken/CH2M HILL
DATE:	November 23, 2010

The B2M preferred alternative route is designed as a lidded, retained cut that would be below ground and out of visual sight from the front of the Winters House, a public building listed on the National Historic Register. This memorandum describes the construction sequence, monitoring program, and minimization and avoidance techniques that have been incorporated into the project and would prevent damage or limit impacts to minor cosmetic damage. If any cosmetic damage occurs, ST will make repair in accordance with the Secretary of Interior's Standards for Treatment of Historic Properties.

Background

Description of Winters House. The Winters House was constructed in the late 1920's by Frederick and Cecelia Winters, prominent early Bellevue citizens. The house utilizes concrete foundations and basement walls and is finished with Spanish architecture, including stucco siding and extensive use of tile. The property was purchased by the City of Bellevue and the house was restored to its present condition in about 1988. The structure is currently used by the City as a cultural and natural interpretive center, community meeting space, and the home of the Bellevue Historical Society.

The structure contains three floors: a main level at street grade, a lower basement, and an upper level. The upper structure is believed to be a wood frame building with stucco (mortar) siding. The lower level is constructed with concrete basement foundation walls extending to about 9 feet or more below grade at the west side and day-lighting at the east. It is not known if or how extensively the structure's concrete foundation walls are reinforced. Given the age of the structure, it is likely however, that the reinforcing in the basement walls and floor is minimal.

Description of Project Next to the Winters House. The new transit corridor will be constructed in a lidded retained cut in the area next to the Winters House. This lidded segment will extend from station 2067+19 to 2068+89, a distance of 170 feet. The Winters House is near the center of this segment.

The lidded transit facility in this 170 foot long segment will consist of a heavily braced excavation with massive secant pile walls along both sides of the retained cut. At its closest point to the Winters House, the outside edge of the secant pile wall will be approximately 9 feet from the main foundation walls of the Winters House. A front porch on the house extends from the main structure and would be about 4.5 to 5 feet from the outside walls of the transit corridor along a short distance (about 15 feet).

A concrete lid will be used to cover and span between the two secant pile walls and will serve as a lateral brace to support a portion of the lateral loads carried by the transit structure walls. Permanent bracing will also be used at rail grade to provide additional lateral support near the base of the transit corridor excavation. The combination of the concrete lid, the permanent bracing at the track grade, and the thick (estimated 4-foot diameter) secant pile walls will result in a very rigid structure that limits lateral ground movement outside the walls to essential zero.

It is important that the Winters house structure be preserved and protected from damage as a result of construction and operation of the new light rail system. This includes protection from lateral movement and control of construction vibrations and vibrations during operation of the facility. Vibrations during operation of the system will be controlled by use of elastomeric pads and special fixation methods intended to reduce vibrations in adjacent structures to levels that will not cause either structural or cosmetic damage to the structure.

Figures, Photos, and Other Attachments. Key features of the house and the planned project are shown in the following figures:

- Attached Figure 1 illustrates the existing floor plans for both the main level and lower levels of the Winters House. Attached photos and figures show a porch that extends about 4.5 feet from the west side of the house towards the street.
- Figure 2 provides a structural cross section of the transit corridor illustrating the elements of this structure and its approximate setting in relation to the Winters House. In this figure, the approximate location of the Winters house foundation walls and footings are shown. The secant pile walls near the house are shown where they will extend below the basement of the house. This figure also illustrates the approximate subsurface strata and groundwater location as measured in nearby soil borings.
- Figure 3 provides a longitudinal profile of the transit facility grade at the Winters House segment. It illustrates the soil types and groundwater conditions in the vicinity of the Winters House.

A package of twelve 11 x17 inch preliminary design drawings is also attached in the appendix of this report showing the alignment and design details in the vicinity of the Winters House. Drawing No. L65-SD010 illustrates the anticipated design configuration of the secant pile wall section.

Finally, selected photos are provided in the appendix illustrating the conditions inside and outside of the Winters House in the vicinity of the proposed construction.

Measures for Minimizing and Avoiding Impacts to Winters House

A number of measures would be used during construction to minimize or avoid the potential impacts of construction on the Winters House. These measures would be included in contract documents to assure that the measures are appropriately implemented. Sound Transit's construction inspectors would provide construction oversight to confirm that the measures are being followed.

1. **Preconstruction Assessment of Winters House and Installation of Monitoring Devices.** Prior to any construction activities at the site, the Winters House will be carefully evaluated to document its condition prior to any construction. Careful observation of existing conditions and close monitoring during construction will assure that construction techniques are controlled as the work approaches the vicinity of the Winters House.

The preconstruction assessment will include inspection of all existing cracks and other existing defects inside and outside of the entire house. These observations will be documented with photos and written description. Selected areas will be prepared by installation of monitoring devices across cracks to precisely monitor additional future movement during or following construction. Settlement plates and benchmarks will be located on and adjacent to the Winters House to allow accurate monitoring of settlement before, during, and following construction. Vibration monitoring equipment will be positioned in the house, including on its foundation, to monitor for vibration during all construction activities in the vicinity of the house.

2. **Choice of Construction Techniques.** Potential project impacts from construction vibration and movement come from the method of design, construction approach, and the machines required for installing the system. These impacts can be minimized by careful selection of the best construction methods and techniques and proper choice of tools and equipment so that vibrations and impacts can be minimized. The most sensitive vibration generating activity associated with the new construction occurs with the installation of the wall system in the segment adjacent to the Winters House. A secant pile wall system has been identified as the best wall type for the particular location. The selection, design, and construction of a secant type pile support system provides the following advantages: 1) secant piles provide a locally common construction method that is widely used by local foundation contractors at sites having similar construction limitations, 2) the secant piles can be installed in a manner that minimizes potential disturbance to nearby facilities, 3) the secant pile system provides a very stiff wall system capable of lateral support with little or no lateral deflection and continuous support of the external soils adjacent to the walls and, 4) the secant pile system allows the transit corridor excavation to be accomplished with only limited need for external control of groundwater. Control of groundwater is important, because changes in water table location can result in settlement of soil, which could damage the house.

3. **Control Construction Vibration and Movement.** Movement within adjacent soil zones and levels of vibration will likely be equipment and site dependent. For this project, the construction approach and equipment is designed to minimize this potential impact:

- The construction work will begin at locations several hundred feet distant from the Winters House. The work would be allowed to advance closer to the Winters House only after the vibration limits are shown to be within tolerable limits and proven excavation and construction methods are achieved as evidenced by controlling vibrations and movements at the house and adjacent to the work. The Contractor will be required to employ alternate excavation techniques if required to control vibrations or prevent damage. The construction procedures and equipment and tools used to conduct the work will be changed at any time that it is necessary to further control vibrations or movement at the house.

- Conservative vibration limits will be established for construction activities occurring near the structure. Experience in the construction industry has shown that anticipated structure damage levels can be correlated to peak particle velocity of structure vibrations. A criterion often used to limit vibration levels to avoid structural damage to residential buildings requires limiting vibration levels to less than 50 mm/sec (about 2 inch/sec) peak particle velocity in the frequency range of 3–100 Hz. In this context, structural damage refers to damage to components of the structure that are used for structural support. Cosmetic or architectural damage, such as cracking of plaster typically occurs at much lower levels of vibration.

- For historic and fragile structures, the limiting level of vibration is normally further reduced to control damage such as cracking of plaster. In severe conditions vibration limits may be controlled to 2.5 mm/sec (about 0.1 inch/sec) peak particle velocity or less. It is important to set realistic criteria for limiting vibration so that damage is avoided to the structure while at the same time, not overly constraining the ability to perform construction activities.

4. **Selection of Pile Installation Methods.** Use of auger drilling methods for installation of the secant piles will limit vibration-induced impacts.

   - In order to limit the vibration associated with installation of secant pile foundations, drilling equipment and excavation methods would be utilized to remove soils from within holes cased with steel pipe.

   - The sidewalls of the secant piles would remain fully supported with steel casings while drilling within the upper zone that extends to a safe depth below the foundation level and footings of the Winters House, extending to dense self-supporting granular soils. Care would be taken to assure that the soil surrounding the casing is not "over-mined" or removed during installation of the casing.

   - Steel casing would extend to the full depth of the piles; however, if insertion of the casing to the full depth of the pile is not possible because of high friction or obstruction, then slurry confinement may be needed to support the deepest portions of the excavation extending below the sensitive foundation zone for house.

     It is important that the casing be installed in a manner that does not disturb or cause movement or excessive vibration in the adjacent soils. The drill bit and maximum depth of excavation for each pile should not be extended below the bottom of the steel casing until the excavation reaches a safe depth below the bottom of the Winters House foundation and the tip of the steel casing pipe is founded in dense self-supporting soils. The casing pipe should be inserted by methods other than vibration or impact that could result in damaging vibration. One method of accomplishing the installation would be by application of down-pressure and use of twisting slots and cutting teeth. Use of heavy equipment capable of applying sufficient down force and lubrication of the sidewalls of the casing may be also be required to achieve this requirement.

If soil conditions suggest that there could be concern for encountering boulders, woody debris (logs), or other foundation conditions that could result in disruption or vibration to adjacent soils, smaller excavation equipment can be utilized within the casing pipe. A "toolbox" of specialized techniques could include such equipment as clams, small diameter flight and bucket augers, coring tools, and/or hand operated jackhammers or other mining equipment that will allow the controlled excavation and removal of soils to safe depths below the base of the facilities to be projected.

Backfilling of each pier with concrete and installation of reinforcing steel should occur immediately upon completion of drilling to the required depth. The steel support casing for pier should be removed as the pier is backfilled. Concrete should be maintained a minimum of about 5 feet above the base of the steel casing pipe at all times as the steel casing is extracted and removed to assure that concrete under controlled head is forced to fill all void space left as the steel casing is withdrawn.

5. **Continuous Monitoring of Winters House.** The protection of Winters House can be assured by performing continuous monitoring of the house, walls, existing cracks, and vibration levels at and surrounding the house. The structure is further protected by monitoring of vibration levels and construction techniques directly adjacent to the work, but in distant segments prior to advancing close to the Winters House. The work will be controlled and limited as needed during construction to avoid disturbance and damage to the house.

   Vibration monitoring will also include monitoring the background vibration levels generated by traffic and existing activities normally occurring in the vicinity of the structure. This includes measurements of vibrations from trucks and other large vehicles travelling on Bellevue Way SE. These background vibration levels will be noted and triggering levels will be identified that are above background vibration levels but below levels that could cause damage to the house.

6. **Construction Settlement from Vibration**. Another consideration for damage is vibration-induced settlement of foundations. Standard penetration test (SPT) blow counts near the Winters House range from 5 to 13 blows per foot within the upper 20 to 24 feet of soil near the Winters House, making soil in this depth interval slightly susceptible to severe-vibration induced settlement, which could potentially lead to settlement of the foundation. Monitoring and controlling the levels of vibration as recommended above, will control the potential for vibration-induced settlement of the foundations.

7. **Construction Settlement from dewatering activities.** It is possible to cause minor settlement of the foundation soils under the house as a result of dewatering activities.

Lowering the groundwater table increases the vertical load on the soils that support the foundation of the Winters House.

Analyses of the movement associated with construction activities, including excavation of the transit corridor and dewatering, were analyzed. The analyses suggest that almost immeasurable settlement could occur (0.1 inch) if the zone surrounding the corridor were to be completely dewatered. The analysis shows that a similar magnitude of movement in the way of rebound (upward movement) could occur as the corridor soils are excavated. These considerations are beyond the ability to accurately predict using geomechanic analyses and are small enough to be non-significant in consideration of these issues.

8. **Lateral Deflection of Piles.** The most likely cause of damage that could occur to the Winters House would likely result from lateral deflection of the walls of the transit corridor during construction. Lateral (horizontal) movement of the corridor secant wall next to the house could result in an approximately equal amount of vertical settlement of the slab-supported porch along the west side of the Winters House.

   To avoid this condition, a conservative approach has been selected for design and construction of the walls. The secant pile wall consists of a massive 4-foot thick concrete reinforced continuous wall. The wall will be capable of conservatively supporting large lateral soil loads with minimal or no deflection. The walls will be constructed by following a sequence that will prevent lateral movement at all times. The sequence of construction is outlined in the section that follows titled "sequence of construction".

   Construction using large diameter secant piles must assure that the piles have sufficient diameter, depth, and reinforcement to provide lateral capacity to control lateral movement of adjacent ground during construction. The concrete piles will be designed to develop sufficient strength and capacity prior to beginning the excavation of interior soils for the transit corridor.

9. **Support of porch along the west side of Winters House**. Based on the configuration shown in Figure 2, and further investigation and verification of shape, configuration, and depth of supporting slab, it may be helpful to provide small piles (referred to as pin piles) or other shallow temporary supporting system or walls to provide increased support and assurance that the soil next to this foundation is not disturbed. Final evaluations of the foundation conditions will be verified during the final design process. Permanent supports will be designed to fully support the soils and footings of the porch.

Monitoring Program

Careful monitoring of the Winters House and selected elements of the new construction would be required as outlined above. Surface monuments would be established at selected points on the walls and foundations of the house in advance of any construction work to observe lateral and vertical movements. Observable cracks in stucco and concrete would be taped or coated in spots at monitoring locations to allow future observation of movements during construction. A complete inventory of the house condition would be thoroughly established prior to beginning the construction work on or near the property.

Monuments would be established on the tops of selected secant piles immediately after completion of pile installation at each monitoring location. All monitoring piles would be monitored for lateral and vertical movement on a daily basis as the construction proceeds. If potentially damaging movement is detected, additional measures would be required to further limit the potential for further movement. Monitoring would begin in areas distant from the Winters House to verify suitable performance prior to the work advancing close to the Winters House.

Monuments established for measurement of movements on the transit corridor facilities and on the Winters House would continue to be read and monitored for a minimum of 6 months or as needed to assure that no additional movement is occurring.

Sequence of Construction

Sequence of construction of the transit corridor is important in controlling the disturbance and lateral movement of adjacent soils. The following construction sequence is anticipated:

1. Begin construction at location distant to the Winters House to verify all construction techniques and performance
2. Set guide beams for control of alignment of secant piles. Accurately drill each secant pile to the required depth using a steel casing to fully support adjacent soils at all times while performing the work. Install steel casing using “oscillator” equipment and down pressure in a manner that minimizes disturbance to adjacent soils. Do not drill below the tip of the casing pipe until the tip of the casing is founded in dense, self-supporting granular soils.
3. Place steel reinforcing cage and backfill each secant pile with concrete. Extract the casing pipe as the concrete is placed, keeping the backfill level of the concrete well above the tip of the steel casing at all times.
4. Construct each secant pile to the required top elevation and form and pour the pile cap.
5. Construct secant pile walls on both sides of transit corridor and complete pile caps prior to beginning corridor excavation.
6. Allow the secant piles to achieve full design strength prior to beginning corridor excavation.
7. Perform limited depth of corridor excavation as limited by design and then install temporary lateral supports at or near the top of the secant pile walls. Provide jackable struts or otherwise shim and support each brace to assure that no movement occurs at the tops of secant pile walls.
8. Install intermediate jackable struts or braces as dictated by final design of the corridor excavation requirements.
9. Control ground water inside the corridor excavation as necessary to perform the work.
10. Excavate to the required base elevation and install granular foundation support materials.
11. Construction permanent concrete base support slab that supports rails.

12. Install permanent lid and remove internal braces and struts in a sequence and manner dictated by final design of the corridor. As necessary, do not remove or release temporary supports until the concrete lid is placed, has achieved full design strength, and is capable of fully supporting the secant pile walls.

Operation of Light Rail

During operation, ground-borne noise impact is projected at the House. Standard methods of vibration reduction, such as resilient fasteners or ballast mats will be incorporated in the project. These measures will reduce the level of ground-borne noise but might not eliminate the impact. Using a floating slab, if necessary, would eliminate the ground-borne noise impacts. Vibration levels during operation are expected to be below the FTA impact criteria.

Winters House Landscape Report

Winters House Landscape Report

PROPOSAL

Sound Transit is proposing to build a portion of the East Corridor light rail guideway parallel to Bellevue Way S.E. In order to mitigate potential impacts to the F.W. Winters House at 2102 Bellevue Way S.E., Sound Transit proposes to depress the alignment located between Bellevue Way S.E. and the Winters House.

The guideway will be below grade in a retained cut (trench). A structural lid has been proposed to cover the trench in the area between the Winters House and Bellevue Way S.E. This report includes a brief review of the landscape history of the house and property for the purpose of explaining the proposed landscape treatment on the lid. The lid is expected to support a 3' depth of soil and planting above. The lid will not be designed to support vehicular traffic.

HISTORY

The Winters House is listed on the National Register of Historic Places, NHRP (National Register of Historic Places Registration Form, 1991, Krafft). The landscape design proposed for the top of the lid considers the history of the house and reflects the cultural and horticultural past of the house and its surroundings.

LATE 1920'S – 1930'S

Frederick and Celia Winters specialized in raising greenhouse azaleas, and later daffodils and iris. In 1917, Frederick Winters purchased 10 acres of property along Mercer Slough, where he and Celia grew azaleas, and bulbs. (Krafft) The Winters residence was constructed on the property in the late 1920's, in the Spanish Eclectic style. "The house was constructed with windows that focused on the bulb fields beyond the backyard." (City of Bellevue Parks and Community Services, *Welcome to the Winters House,* brochure.) Terrain in the slough proved to be too swampy for growing bulbs, so the Winters later sold off portions of their land (Krafft).

The landscapes shown in figures 1 and 2, from the mid- to late-1930s, consist of an open area adjacent to the road and a buffer of small conifers against the front of the house. Figure 3 illustrates a plan view interpretation by Nakano Associates of this time period.

Figure 3. *Landscape Plan: Winters House– circa 1935, Nakano Associates interpretation*

1940'S – 1960'S

In 1943, Anna and Frank Riepl purchased 1.31 acres of the Winters property, including the house. They made changes to the landscape at the front of the house (circa 1950, 1957, 1962), including construction of a fish and lily pond (Krafft). Mrs. Riepl lived in the main house until 1983. The pond no longer exists.

Endre Ostbo purchased the remaining 3.69 acres. He raised rhododendrons on his portion of the land. Later, his son Owen took over and operated a rhododendron nursery on the site until the late 1970's.

The landscapes in figures 4 and 5 show the addition of deciduous trees and shrubs. The largest conifer seen in front of the house in figure 2 had been removed by the time the photos in figures 4 and 5 were taken in 1945.

Figure 6. *Landscape Plan: Winters House – circa 1945, Nakano Associates interpretation*

LATE 1980'S

In 1988, the City of Bellevue purchased the Winters estate, rehabilitated the house, and had it placed on the National Register of Historic Places.

"The nominated property includes the Winters House and the landscaped property within 50 feet of it… Winters House is significant for both its distinctive architectural character and its association with bulb growing and the floricultural industry in King County and Washington State." (Krafft)

Features in the landscape have been altered a number of times since the house was built. Statements on the National Register of Historic Places registration form describe the early landscape as: *"The house is… buffered from the roadway by a small grove of deciduous and conifer trees and shrubs. Originally a substantial lawn, fish pond and planted area separated the residence from the old narrower roadway… The house is the only intact historic resource to remain on the site."* (Krafft)

Most of the shrub layer no longer existed in front of the house at the time of the 1988 renovation. Several trees can be seen in figure 7 below.

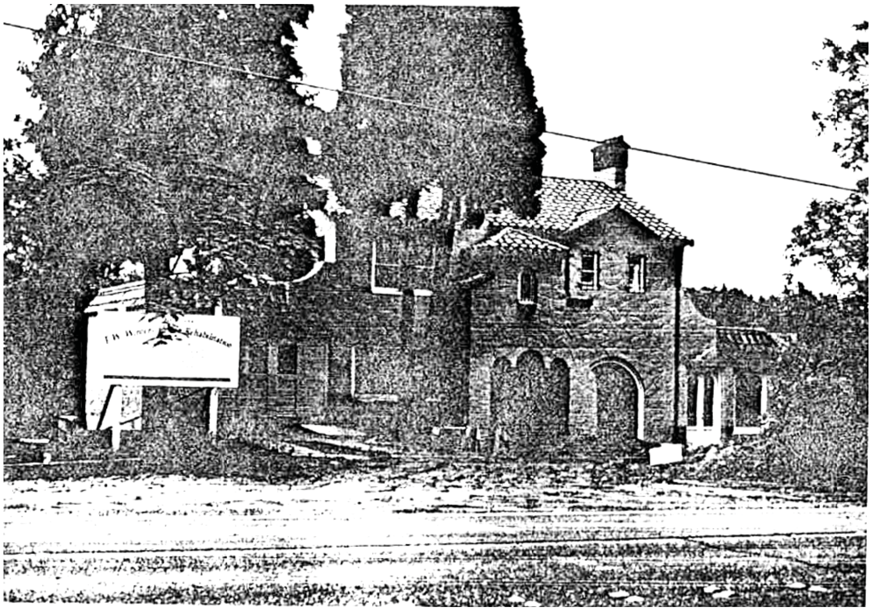

Figure 7. *Winters House – Rehabilitation*

1990'S

In 1993, a new plan for the Winters House was prepared by John Forrest Barker Landscape Architects, P.S. This plan allowed for accessible parking and entry at the northwest corner of the house. It retained the "original driveway" (per John Barker) as a central pedestrian entry off of Bellevue Way S.E. The plan specified silk trees (Albizia julibrissen), magnolias and a honey locust (Gleditsia triacanthos 'Halka'), as well as witch hazel, viburnums, rhododendrons, and azaleas. See figure 8 below.

Figure 8. *1993 Landscape Plan - John Forrest Barker Landscape Architects, P.S.*

2010

The Winters House is currently operated by Bellevue Parks Department and houses the offices and archives of the Eastside Heritage Center. This use is consistent with the intent listed in the NRHP Registration form: *"The F.W. Winters House shall be used as a public meeting and local historical society facility which will also serve to interpret both the natural and the cultural history of Mercer Slough."* (Krafft)

The existing landscape in the location of the proposed lid structure includes a number of rhododendrons and azaleas, as well as several magnolia trees and a mature walnut tree. There is no radiating layout of silk trees (as had been shown in the 1993 landscape plan shown in figure 8.) Massings of witch hazel (Hammamelis) and burning bush (Euonymus) exist today and likely contribute significantly to a display of fall color. Figures 9-13 illustrate shrub borders and trees separating the lawn and house from the street.

CH2MHill contracted HRA (Historical Research Associates) architectural historians review the extant landscape and historic photographs to consider whether the landscape of the house is character-defining or includes any character-defining features from the historic period. (CH2MHill, 17 June 2010)

In particular, HRA assessed the 50-foot boundary provided in the NRHP Registration form which includes the set back of the residence from Bellevue Way. The NRHP Registration form includes the following boundary justification:

> The nominated property includes the Winters House and the landscaped property within 50 feet of it. While the otherwise undeveloped grounds within the surrounding and adjacent acreage are associated with the house, they are no longer cultivated and no intact outbuildings remain. While complimenting the historic residence, the surrounding grounds no longer retain integrity.

Analysis of the 50-foot designated boundary to determine whether any character-defining landscape features remain currently that convey the significance of the residence and its relationship to the landscape found no such features. Rather, all of the surrounding landscape of the house was found to have been altered substantially from the historic period of the residence. Except for some mature trees beyond the rear of the residence that once were part of the larger property, the current landscape features do not in any way reflect the original landscape of the residence, nor do they convey the relationship of the landscape to the structure as it was first designed, matured, and allowed to evolve during the historic period of the property. (CH2MHill, 17 June 2010)

RECOMMENDED LANDSCAPE

Secretary of the Interior's Standards for Rehabilitation
New work shall be differentiated from the old and shall be compatible with the massing, size, scale, and architectural features to protect the historic integrity of the property and its environment. Those changes that have acquired historic significance in their own right shall be retained and preserved. (National Park Service, The Secretary of the Interior's Standards for Rehabilitation, http://www.nps.gov/hps/tps/tax/rhb/stand.htm, 12 July 2010.)

Although the current landscape features do not reflect the original landscape, certain elements have persisted over time. These elements include an open lawn, and plant species (rhododendrons, azaleas, daffodils and tulips) that reflect the horticultural past of the property.

Proposed conditions dictated by light rail design:

1.) A new landscape design is proposed for the area to the west of the Winters House, between the house and South Bellevue Way, where a 170-foot long lid covers the light rail guideway (figures 14 and 15.)
2.) Soil depth on the lid: 3' (Large shrubs and small trees can grow in this depth.)
3.) Parking lot elevation to be raised approximately 9'. This will reduce the grade change from the parking lot to the front of the house and increase the change from the parking lot to the east patio on the lower level. A new ramp system is proposed to provide an accessible path to the lower level of the house.
4.) Retained cut trench adjacent to the lid to be bordered by 8' high fencing on both sides (2'-10" barrier and 5'-2" fence.)

The recommended landscape design for the proposed lid (figure 15) reinforces the layout of a central axis (as seen in figure 6, Winters House – circa 1945), creates a strong entry and maintains the axial layout in front of the house. One main feature of the early landscapes was an open lawn. The proposed open lawn would be encircled by shrub borders adjacent to the sidewalk along Bellevue Way S.E. to buffer the house and yard from street traffic. The borders would feature azaleas, rhododendrons, daffodils and tulips to reflect the horticultural past of the house.

At mature height, the proposed border will be about 3' high at the central opening of the garden. Shrubs at the north and south end of the garden, adjacent to the guideway barriers, will be 6'-10' high to screen views from the house to the guideway barrier. Columnar street trees will provide an additional screen between the front of the Winters House and Bellevue Way S.E.

A six-foot wide walkway along the north edge of the lid and along the front of the house allows for direct pedestrian access to the trail system below. With the raising of the parking lot elevation, walkways to the house will be graded for accessible entry at the street level and the lower level entry on the east side of the house. Figures 16-18 illustrate three views of the front of the Winters House, and the general layout and massing of the proposed landscape.

Subject: Invitation to Participate in the Environmental Review Process
and Initiation of Section 106 Consultation for the East Link Project

Dear Chairman Sweet:

The Federal Transit Administration (FTA), in cooperation with Sound Transit and the Washington State Department of Transportation (WSDOT), is initiating the preparation of an Environmental Impact Statement (EIS) for the proposed East Link project. The EIS will be a combined document under NEPA and the Washington State Environmental Policy Act (SEPA). Sound Transit and the Washington State Department of Transportation (WSDOT) will be co-lead agencies for SEPA compliance. The proposed project is located in King County, Washington. The proposed purpose of the project is to expand the Sound Transit Central Link rail system from Seattle to Bellevue and Redmond, via Interstate 90 (I-90) and across Mercer Island, to provide a reliable and efficient alternative for moving people throughout the region.

The enclosed Scoping Information Report provides more details including a map of the project area, maps depicting proposed route and station location alternatives, a schedule for the EIS process, the preliminary project Purpose and Need Statement, and elements of the environment to be evaluated in the EIS.

To ensure that we account for any effects of this undertaking on properties listed in or eligible for listing on the National Register of Historic Places, FTA confirms the initiation of the Section 106 consultation pursuant to 36 CFR 800.2(a)(4).

In addition, recently enacted federal legislation, Section 6002 of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU), establishes an enhanced environmental review process for certain FTA projects, increasing the transparency of the process, as well as opportunities for participation. The requirements of Section 6002 apply to the East Link project. As part of the environmental review process for this project, the lead agencies must identify, as early as practicable, any other Federal and non-Federal agencies that may have an interest in the project, and invite such agencies to become participating agencies in the environmental review process.[1] The Snoqualmie Tribe has been identified preliminarily as one that may have an interest in this project, because of the potential in the project area for historic or cultural resources listed in or eligible for listing in the National Register of Historic Places; accordingly, you are being extended this invitation to become actively involved as a participating agency in the environmental review process for the project.

---

[1] Designation as a "participation agency" does not imply that the participating agency supports the proposed project or has any jurisdiction over, or special expertise concerning the proposed project or its potential impacts. A "participating agency" differs from a "cooperating agency," which is defined in regulations implementing the National Environmental Policy Act as "any Federal agency other than a lead agency which has jurisdiction by law or special expertise with respect to any environmental impact involved in a proposal (or a reasonable alternative) for legislation or other major Federal action significantly affecting the quality of the human environment." 40 C.F.R. § 1508.5.

As a participating agency, you will be asked to:

- Participate in the NEPA process starting at the earliest possible time, especially with regard to the development of the purpose and need statement, range of alternatives, EIS analysis methodologies, and the level of detail for the analysis of alternatives.
- Identify, as early as practicable, any issues of concern regarding the project's potential environmental or socioeconomic impacts.
- Provide meaningful and timely input on unresolved issues
- Participate in the EIS scoping process.

Written responses to this invitation are due at the close of the scoping process on October 2, 2006. Please use the attached Participating Agency Designation form to accept or decline this invitation.

Scoping

An agency scoping meeting has been scheduled for September 12, 2006 at Bellevue City Hall, 450 110th Avenue NE, Bellevue, WA 98004, from 1:00 to 3:00 p.m. The 30-day scoping comment period begins on September 1 and ends October 2, 2006. As described in the enclosed Scoping Information Report, scoping comments are requested on the proposed range of alternatives, the probable significant impacts, and detail of analysis on specific environmental impacts to be included in the EIS. In addition, comment on the preliminary project Purpose and Need is being solicited during the scoping period pursuant to the SAFETEA-LU federal legislation that states lead agencies will provide an opportunity for agency and public comment on the purpose and need statement early in the environmental review process. The preliminary project Purpose and Need statement is provided in the Scoping Information Report. The draft project Coordination Plan prepared pursuant to SAFETEA-LU is also enclosed.

If you have questions regarding this invitation, please contact John Witmer, FTA Region 10 Community Planner, at (206) 220-7964.

Sincerely,

R.F. Krochalis
Regional Administrator

Re: East Link Project EIS Methodologies for Review

Dear Chairman Sweet:

Enclosed are the proposed Archaeological and Historic Resources, Water Resources, and Ecosystems methodologies for conducting the analysis in the East Link Environmental Impact Statement (EIS). These methodologies are provided for your review in continuing consultation on this project. A copy of the proposed outline for the EIS is also enclosed.

Please provide consolidated Snoqualmie Tribe comments for these methodologies by January 22, 2007. After receipt of comments from all the participating agencies and consulting tribes, Sound Transit will revise the methodology as appropriate. Sound Transit staff would be happy to meet with the Tribe to discuss the draft methodologies and the Tribe's comments during this period. Please use the enclosed comment form or similar format for providing comments.

Please return comments to Lauren Swift, Environmental Planner at the following address: Link Light Rail, Sound Transit, 401 S. Jackson Street, Seattle, WA 98104. If you have any questions or would like to schedule a meeting to discuss a particular methodology, please call Lauren Swift, at 206/398-5445.

Sincerely,

James Irish

Re: East Link Project EIS Methodologies for Review

Dear Ms. Joseph:

Enclosed is the proposed Historic and Archaeological Resources analysis methodology for conducting the analysis in the East Link Environmental Impact Statement (EIS). This methodology is provided for your review pursuant to the Safe, Accountable, Flexible, Efficient, Transportation Equity Act: A Legacy for Users (SAFETEA-LU). A copy of the proposed outline for the EIS is also enclosed.

Please provide consolidated BIA comments for this methodology by January 22, 2007. After receipt of comments from all the Participating and Cooperating Agencies, Sound Transit will revise the methodology as appropriate. Sound Transit staff would be happy to meet with BIA to discuss this draft methodology and the agency's comments during this period. Please use the enclosed comment form or similar format for providing comments.

The Federal Transit Administration, NEPA lead for this project with Sound Transit, has not received BIA's confirmation of Participating Agency status in response to the FTA's August 24, 2006 invitation letter. Methodology review is provided for Cooperating and Participating agencies. Because Sound Transit feels that the BIA may be interested in serving as a Participating Agency, we are transmitting these for your review. However, in order to ensure that your input is considered as appropriate in finalizing the EIS methodology and throughout the EIS process, it is important that BIA indicate its participation status. A Participating Agency Designation Form is enclosed. Pursuant to SAFETEA-LU Section 6002(d)(3), if BIA elects not to become a Participating agency, you must decline the invitation in writing, indicating that your agency has no jurisdiction or authority with respect to the project, no expertise or information relevant to the project, and does not intend to submit comments on the project. Otherwise, BIA is considered a Participating Agency.

Re: Review Comments

Dear Mr. Irish:

Thank you for contacting the Washington State Department of Archaeology and Historic Preservation (DAHP). The East Link project materials have been reviewed on behalf of the State Historic Preservation Officer under provisions of Section 106 of the National Historic Preservation Act of 1966 (as amended) and 36 CFR Part 800. My review is based upon documentation contained in your communication.

Overall, the field methods described in the document received on 21 December, 2006, seem sound and prudent. We appreciate the opportunity to review and comment.

Please note that DAHP has developed a set of cultural resource reporting guidelines. You can obtain a copy of these guidelines from our Web site. Thank you for the opportunity to review and comment.

Sincerely,

Matthew Sterner, M.A., RPA

Property: Sound Transit East Link Project, Seattle to Bellevue to Redmond
Re: Area of Potential Effects

Dear Dr. Brooks:

The purpose of this letter is to consult with you on the Area of Potential Effects (APE) for the Sound Transit East Link Project as required by 36 CFR 800.4(1). We have attached maps of the alternative alignments currently being considered by Sound Transit for the East Link Project. These maps consist of segments A, B, C, D, and E which show the APE for each segment. Section 106 historic properties within 200 feet of these segments are also shown in the attached maps.

The APEs within which archaeological and historical resources will be inventoried and evaluated for project effects will generally be one block (approximately 200 feet) on either side of at-grade or elevated alternatives or where tunnel alternatives will disturb the surface or have the potential for other surface impacts, depending on terrain and local land use. In some locations, the APE may extend further than 200 feet from an alternative, as shown on the attached maps. The horizontal APE around alternatives, station locations, and maintenance facility locations will also generally be one block, or approximately 200 feet, beyond project limits (i.e., property line). For the archaeological resource investigation, the vertical APE may vary according to construction practice and depth of excavation, depending on the geomorphology of the landform where the project element occurs.

This APE is consistent with the discussion contained in the "East Link Project, Technical Analysis Methodology Memo for Historic and Archaeological Resources," December 19, 2006. Matthew Sterner provided comments on this memo in a letter to James Irish, Sound Transit, dated January 2, 2007.

Per 36 CFR 800.2(a)(3) and 800.2(c)(4) of these regulations, FTA is authorizing Sound Transit, as an applicant for Federal assistance, to prepare information, analyses, and recommendations regarding Section 106 consultation for this project. The delegated authority to initiate consultation does not extend to making determinations, such as the area of potential effects or consulting parties.

If you have any questions, please contact John Witmer at (206) 220-7964.

Sincerely,

Linda M. Gehrke

for R.F. Krochalis
Regional Administrator

Re: Archaeology - APE Concur

Dear Mr. Krochalis:

We have reviewed the materials forwarded to our office for the East Link project. Thank you for your description of the area of potential effect (APE) for the project. We concur with the definition of the APE. We look forward to the results of your cultural resources survey efforts, your consultation with the concerned tribes, and receiving the survey report. We would appreciate receiving any correspondence or comments from concerned tribes or other parties that you receive as you consult under the requirements of 36CFR800.4(a)(4) and the survey report when it is available.

These comments are based on the information available at the time of this review and on behalf of the State Historic Preservation Officer in conformance with Section 106 of the National Historic Preservation Act and its implementing regulations 36CFR800. Should additional information become available, our assessment may be revised. Please note that DAHP has developed a set of cultural resource reporting guidelines. You can obtain a copy of these guidelines from our Web site. Thank you for the opportunity to review and comment. Should you have any questions, please feel free to contact me.

Sincerely,

Matthew Sterner, M.A., RPA

Re: Eligibility Determinations

Dear Dr. Brooks:

The Federal Transit Administration (FTA) is forwarding to you the enclosed information on properties located within the area of potential effects (APE) for the East Link Light Rail Project sponsored by Sound Transit. There are three packets of information:

1. Section 106 Historic Forms for Properties within the East Link APE Recommended as Eligible for the National Register. Forms are provided for 10 properties.

2. Surrey Downs. Properties within the Surrey Downs subdivision in Bellevue, Washington are treated separately. The memorandum from Ann Gillespie, Historical Research Associates, Inc., dated May 22, 2007, discusses the subdivision and provides inventories for houses that appear to be National Register eligible as contributing resources to a potential historic district within Surrey Downs. Forms are provided for 17 properties.

3. Section 106 Historic Forms for Properties within the East Link APE Recommended as Non-Eligible for the National Register. Forms are provided for a large number of properties and are grouped by project segment.

FTA requests your concurrence on the enclosed eligibility determinations. If you have any questions, please contact John Witmer at 206-220-7964.

Sincerely,

R.F. Krochalis
Regional Administrator

Re: Determined Eligible

Dear Mr. Krochalis:

Thank you for contacting our office. I have reviewed the materials you provided to our office which have been prepared for Sound Transit by HRA. The report included 302 Historic Property Inventory Forms. After careful evaluation, the following properties/resources have been determined ELIGIBLE for the National Register of Historic Places. Note that this list differs slightly from the resources which were determined eligible by Sound Transit's consultant.

ELIGIBLE:
Pilgrim Lutheran Church - 10420 SE 11th St., Bellevue (Criteria C)
Winters, Frederick, House – 2102 Bellevue Way SE, Bellevue (Already Listed on NRHP)
Bellevue Fire Station – 14822 NE Bellevue-Redmond Rd., Bellevue (Criteria A, C)
Bill Brown Building – 7824 Leary Way NE, Redmond (Criteria B)
Justice White House/Hotel Redmond – Leary Way (Formally Determined Eligible by
Keeper of NR, but not listed due to owner objection. not on State Register.
W.H. Thompson House – 3119 S. Day St., Seattle (Listed on NRHP)
Immigration & Assay Building – 851 Airport Way S., Seattle (Listed on NRHP)
Surrey Down Neighborhood – Bellevue (Criteria A & C, contributing properties to a potential historic district, exact boundaries of which have not been defined)

88 110th Ave SE
106 110th Ave SE
114 110th Ave SE
122 110th Ave SE
10915 SE 1st St.
115 110th Ave SE
121 110th Ave SE
125 110th Ave SE
214 110th Ave SE
203 110th Pl SE
11022 SE 2nd St.
11039 SE 2nd St.
10904 SE 1st St.
128th 109th Ave SE
122 109th Ave SE
114 109th Ave SE
103 109th Ave SE

The following resources are found to be Not Eligible, despite the consultant's recommendations. The below properties are not yet 50 years old and the information that was provided on the Historic Property Inventory Forms does not justify special criterion consideration G for exceptional significance.

NOT ELIGIBLE: (although identified by consultant as Eligible)
Haida House – Sammamish Parkway
Highland Covenant Church – 15022 NE Bellevue-Redmond Rd.
First Baptist Church – 1100 Bellevue Way

These comments are based on the information available at the time of this review and on behalf of the State Historic Preservation Officer pursuant to Section 106 of the National Historic Preservation Act and its implementing regulations 36CFR800.

Thank you for the opportunity to review and comment. Should you have any questions, please feel free to contact me.

Sincerely,

Michael Houser

SUBJECT: East Link Historic Property Inventory

Dear Mr. Irish:

I have had an opportunity to review the historic inventory forms that were prepared for the DEIS. I would concur with the assessment on these properties. You are correct in noting three properties that have likelihood to meet National Register eligibility, the Justice White house, the Bill Brown building, and the Haida house. I would also like to call out that one property, the Redmond Trading Company, is on a local City of Redmond register. This structure, however, has had some extensive front façade modifications which would preclude it from National Register nomination.

The City of Redmond has a relatively complete survey and inventory and no additional historic properties lie in the proposed study corridor.

I would also note that Marymoor Park has known cultural resources. The extensive amount of disturbance that has already occurred along the proposed alignments as it enters the valley north of the Park would lower the expectation of that occurrence but the City of Redmond would like you to note the possibility in the EIS.

It appears that the review has been thorough and the City of Redmond would not expect any additional properties to be addressed in an EIS for this project.

Sincerely,

Dianna M Broadie

Re: Cultural Areas in the Project Area

Dear Mr. Irish,

I am writing in response to an e-mail that Lauren Swift sent on August 29, 2007 (yes, we really are that late!) asking us whether any Snoqualmie Tribal elders informed us of any important cultural areas within the proposed project area for the Link Light Rail. At this time, there are no specific sites that we wish to identify at this time. The entire project is being planned within important traditional areas of the Tribe and we do not feel that it would be productive to highlight just one or two areas of concern. I hope that makes sense to you.

One question we have is more of a policy question, but one we would like answered nonetheless. The Tribe's main interest in regards to cultural resources is to ensure that all of the Tribe's cultural heritage is maintained and protected to the greatest extent possible. One way of making that happen is to construct projects such as the Link Light Rail in areas which have already experienced a significant amount of ground disturbance. In that vein, we are wondering whether Sound Transit is looking at the Burlington Northern Eastside Rail Corridor as a future home to light rail on the east side. Based on reports we have seen in the news media, it appears as if the Port of Seattle and King County intend to purchase this rail corridor in order to convert it into a recreational trail. It is hard for us to comprehend why they would want to remove an existing rail corridor, when that is exactly what you are trying to create. The amount of ground disturbance, and in turn the risk to cultural resources, would be much greater under either of the proposed alternatives that you are evaluating, when compared to utilizing an existing rail corridor. That is in addition to all other concerns regarding congestion on the east side. I would really appreciate if you could inform us of Sound Transit's position in regards to the Burlington Northern rail corridor. This is an issue of great importance to the Snoqualmie Tribal membership. I apologize for having taken so long to get back to you. If you have any questions, please do not hesitate to contact me at (425) 888-6551 ext. 112.

Sincerely,

Andrea K. Rodgers

Re: Additional Eligibility Determinations

Dear Dr. Brooks:

The Federal Transit Administration (FTA) is forwarding to you 75 additional historic property inventory forms with eligibility determinations for properties located within the area of potential effects (APE) for the East Link Light Rail Project. Also included is a CD of the amended database files in ACCESS format.

This is the second package of East Link property forms FTA has sent to the Department of Archaeology and Historic Preservation (DAHP) for determinations of eligibility. DAHP responded to the first package in a letter dated November 16, 2007. This second package contains the following forms listed by jurisdiction, with the reason for the additional forms noted below:

1) Seattle (4 additional forms): During its review of the first set of inventory forms submitted in July, 2007, DAHP requested additional forms be prepared for existing National Register of Historic Places (NRHP) sites in the study area (12th Avenue Bridge; Mt Baker Ridge tunnel; Publix Hotel). In addition, a quality control review found another property within the APE that needed to be included (Ming's Asian Gallery at 519 6th Avenue S.).

2) Mercer Island (2 additional forms): After the first submittal to DAHP in July 2007, additional quality control was conducted on the forms submitted and compared against the structures age database. As a result, two additional properties were identified within the APE that met the age criteria and forms were prepared for these properties.

3) Bellevue (68 additional forms): Additional forms have been prepared for properties in Bellevue. First, Sound Transit added a series of alternative tunnel connections via Surrey

Downs Park north into downtown Bellevue. The tunnel alternatives in Bellevue include a 200-foot wide swath (100 feet on either side of the tunnel alternatives) for residences above the tunnel to account for potential ground-borne noise impacts, vibration, or soil settlement to these structures. This resulted in 50 additional residential properties surveyed in the Surrey Downs neighborhood. As discussed with Matt Sterner of DAHP, this 200-foot wide APE for the underground tunnel alternatives is smaller than the 400-foot wide APE (200 feet on either side of the alignment centerline) for the above ground (at-grade and elevated) alignments. The larger APE for above ground alignments is intended to cover visual impacts on potentially historic properties which would not occur for the tunnel alternatives. The 200-foot wide APE for the tunnel alternatives is considered large enough to cover any potential noise, vibration, and settlement impacts on above ground properties.

Additionally, a quality control review found additional sites within the existing APE that met the age criteria; thus forms were prepared for these properties.

4) Redmond (1 additional form): A quality control review was also conducted within the City of Redmond and, as a result, one additional property was identified within the APE that met the age criteria; thus a form was prepared for that property.

Please note that the matrix summary table attached (East Link: Historic Buildings and Structures, 50 years and older, by jurisdiction) with this submittal lists all of the properties for which historic property forms have been prepared. The 75 properties in this second submittal are highlighted in the table. Also included in the attached package are detailed maps showing the location of all properties within the APE for which forms were prepared (both the first and second package submittals). These detailed maps were not available at the time of the first submittal.

FTA requests your concurrence on the enclosed eligibility determinations. If you have any questions, please contact John Witmer at 206-220-7964.

Sincerely,

R.F. Krochalis
Regional Administrator

Subject: East Link Historic Property Inventory

Dear Mr. Kennedy:

I am writing regarding Sound Transit's request for the City to review Sound Transit's historic inventory forms for buildings within the East Link Area of Potential Effect (APE) on Mercer Island. I have reviewed the forms which identify properties located within 200 feet of the East Link project alignment and will be 50 years or older by 2016.

None of the properties identified in the forms are currently designated by the City as "historical" pursuant to Mercer Island City Code Chapter 16.01 and I am not aware of information associated with any of the properties that would make them eligible for consideration of historical designation by the City. The only properties currently designated by the City as historical are:

- Luther Burbank Administrative Building located at Luther Burbank Park
- Veterans of Foreign Wars Hall located at 1836 72nd Ave. SE.

I can be reached at (206) 275-7722 or patrick.yamashita@MercerGov.org if you have any questions.

Sincerely,

Patrick Yamashita
City Engineer

Re: Determination of Eligibility

Dear Mr. Krochalis:

Thank you for contacting our office. I have reviewed the materials you provided to our office which have been prepared for Sound Transit by HRA. The report included 75 additional Historic Property Inventory Forms for the Sound Transit East Link Project. After careful evaluation, the following properties/resources have been determined ELIGIBLE for the National Register of Historic Places. Note that this list differs slightly from the resources which were determined eligible by Sound Transit's consultant.

ELIGIBLE:
12th Avenue South Bridge – 12th Ave over Dearborn St., Seattle (Already Listed on NRHP)
Mount Baker Ridge Tunnel – Seattle (Already Listed on NRHP)
Publix Hotel – 504 5th Avenue S., Seattle (Already Listed on NRHP as part of District)
Surrey Down Neighborhood – Bellevue (Criteria A & C, contributing properties to a potential historic district, exact boundaries of which have not been defined)

215 110th Ave SE
204 110th PL SE
11005 SE 2nd St.
11014 SE 2nd St.
11030 SE 2nd St.
11040 SE 2nd St.
10910 SE 1st St.
241 109th Ave SE
301 109th Ave SE
313 109th Ave SE
401 109th Ave SE
409 109th Ave SE
412 109th Ave SE
428 109th Ave SE
431 109th Ave SE
436 109th Ave SE
442 109th Ave SE
423 110th Ave SE

The following resources are found to be Not Eligible, despite the consultant's recommendations.

NOT ELIGIBLE: (although identified by consultant as Eligible)
Walsen House - 317 109th Ave SE (low integrity)
Cross House - 420 109th Ave SE (low integrity)

+All other surveyed resources that are not specifically identified in list.

These comments are based on the information available at the time of this review and on behalf of the State Historic Preservation Officer pursuant to Section 106 of the National Historic Preservation Act and its implementing regulations 36CFR800.

Thank you for the opportunity to review and comment. Should you have any questions, please feel free to contact me.

Seattle, WA 98104-2826

SUBJECT: Historic Property Inventory for the City of Seattle, East Link Project EIS

Dear Mr. Irish:

Thank you for the opportunity to review the historic forms for structures located within the East Link area of potential effect (APE) in Seattle.

I understand that the Department of Archaeology and Historic Preservation has also reviewed the historic forms and concurred with Sound Transit's assessment that with the exception of five existing historic structures along the East Link corridor in Seattle, there are no other historic structures that appear to be eligible for the National Register of Historic Places (NRHP). These NRHP-eligible properties are:

1. Publix Hotel
2. Immigration Station and Assay Office
3. 12th Avenue South Bridge
4. Will H. Thompson House
5. Mount Baker Ridge Tunnel and Easter Portals

In addition to the NRHP-eligible properties listed above, based on my review of the forms, I believe that there are two properties located within the APE that may be eligible pursuant to the Seattle's Landmarks Preservation Ordinance (SMC 25.12.350): These properties are located at: 1402 32nd Avenue and 1101 Airport Way South.

Administered by The Historic Preservation Program
The Seattle Department of Neighborhoods
"Printed on Recycled Paper"

Thank you again for the opportunity to review the historic property forms that are associated with the East Link project within Seattle's city limits. If you have any questions, please contact me at karen.gordon@seattle.gov or at 206-684-0381.

Sincerely,

Karen Go

RE: *Draft Environmental Impact Statement for East Link light rail project*
Seattle, Mercer Island, Bellevue, and Redmond, Washington

Dear Mr. Irish:

On December 8, 2008, the Advisory Council on Historic Preservation (ACHP) received a copy of the Draft Environmental Impact Statement for the referenced undertaking. Our comments pursuant to the National Environmental Policy Act of 1969 (NEPA) were requested. We have no comments pursuant to NEPA at this time.

While the documentation provided indicates that the proposed undertaking may adversely affect historic properties, we have no record of receiving notification of adverse effects from the Federal Transit Administration (FTA) regarding this undertaking as is required under our regulations, "Protection of Historic Properties" (36 CFR Part 800). Please continue to consult with the Washington State Historic Preservation Office (SHPO) and other consulting parties to complete the requirements of the Section 106 process. If, or when, FTA makes an adverse effect finding in this case, you should provide the required notification and documentation to ACHP in accordance with 36 CFR § 800.6 and § 800.11(e).

If you have any questions or would like to discuss this issue, please contact Blythe Semmer by telephone at (202) 606-8552 or by e-mail at bsemmer@achp.gov.

Sincerely,

Charlene Dwin Vaughn

Re: Receipt of DEIS

Dear Mr. Krochalis:

Thank you for contacting the Washington State Department of Archaeology and Historic Preservation (DAHP) and providing a copy of the draft Environmental Impact Statement for the East Link Project, Seattle to Bellevue to Redmond. The document has been reviewed on behalf of the State Historic Preservation Officer under provisions of Section 106 of the National Historic Preservation Act of 1966 (as amended) and 36 CFR Part 800. My review is based upon documentation contained in your communication.

While your cover letter accompanying the submittal requests a concurrence with a determination of no adverse effect for the project, we cannot concur with your determination at this time. Since a preferred alternative has not yet been selected and final engineering for each stage has not been undertaken to date, it would be premature for DAHP to concur with any determination of effect until more information on the potential effects of the project on cultural resources is presented. Please consult again with us when a preferred alternative has been selected and additional engineering has been completed that more thoroughly documents the impacts that the project may have on resources that have been identified within the projects area of potential effect.

Re: DEIS Review Comments

Dear Mr. Krochalis:

Thank you for contacting the Washington State Department of Archaeology and Historic Preservation (DAHP) and providing a copy of the Draft Environmental Impact Study (DEIS). The document has been reviewed on behalf of the State Historic Preservation Officer under provisions of Section 106 of the National Historic Preservation Act of 1966 (as amended) and 36 CFR Part 800.

This letter is a follow up to a previous letter drafted on January 5th. Following my meeting with the Federal Transit Authority (FTA) and Sound Transit (ST) on January 29th, I am in a better position to review and comment on your original cover letter (December 2, 2008) that accompanied the DEIS submittal.

Regarding historic structures that have been identified and reviewed within the area of potential effect (APE) for the project, 45 properties have been concurred upon by DAHP as being eligible for listing in the National Register of Historic Places (NRHP). The remaining 332 properties within the APE have been concurred upon/determined by DAHP as not eligible for listing in the NRHP. Communications to FTA from DAHP regarding these eligibility determinations were sent on November 16, 2007, and February 20th, 2008.

To date, no archaeological resources have been identified within the APE.

Comments presented in this letter are based on my review of the Historic and Archaeological Resources Technical Report (Appendix H-4 of the DEIS), not on the DEIS itself. I will presume that modifications made to the discipline report will find their way into the DEIS.

Below are some specific comments regarding built environment issues that I have identified in the DEIS, in consultation with Russell Holter, Compliance Reviewer, and Michael Houser, State Architectural Historian:

- The Endresen Residence and Romaine Electric building are resources that are identified in Table 7-3 as Seattle Landmark-eligible properties within Segment A of the proposed alignment. I understand from Michael Houser that these properties were not among the properties considered eligible for listing in the NRHP. Is some elevated status being provided to these properties by including them in Table 7-3? Since these properties 'may be' eligible for City Landmark status (page 7-7), should there be some discussion of effects to them in Section 8.0?
- The discussion of cultural resources within Segment A does not include the NRHP-eligible I-90 (Lacey V. Murrow Memorial) bridge. Please include a discussion of this resource and proposed effects as a result of the project.
- We are withholding comment regarding potential effects, both during construction and operation, that may occur to the Immigrant Station and Assay Office (INS Building) until more detailed construction design/engineering plans are forwarded. The proximity of the proposed alignment to the structure appears to be too close to discount any effect at this time. If engineering documents are presented at a later date that can substantiate the 'no effect' determination, we will revisit your recommendation.
- Alignment alternatives within Segment B, as presented in the DEIS, would not adversely affect the Frederick Winters House. However, any modification of the alignments, as proposed, would warrant a reassessment of the effect determination.
- Page B-3 of the report states that, "construction of the underground stormwater detention vault at the northeast corner of the Pilgrim Lutheran Church parking lot would have temporary noise effects on the church, but these effects are not considered adverse." Any "take" of property, in this case the northeast corner of the Pilgrim Lutheran Church parking lot, that is listed in the NRHP constitutes an adverse effect to that property. This would also trigger a 4(f) evaluation.
- Alignment preferences within Segment C would favor those that avoided any property acquisition within the Surrey Down Neighborhood. Having been determined NRHP-eligible as a district, property acquisition within this area is problematic and another potential 4(f) issue.
- Within Segment D, the discussion is unclear exactly how Alternative D3 would affect the former Bellevue Fire Station, a NRHP-eligible property. The text suggests that there will be a property take but that the "building itself is outside the APE." Any take of a NRHP-eligible property suggests an adverse effect to that property and would likely trigger a 4(f) evaluation.
- Within Segment E, the discussion focuses on the potential effects of Alternative E4 on the NRHP-eligible Justice William White House. Conceptual design suggests that this alignment would have an adverse effect on that property. However, we would also question the effect of Alternative E2 on the White property, as it appears (in Exhibit B-12) to pass just as close to the property as Alternative E4. We would require additional review of construction design/engineering drawings before making a concurrence on effect to this property.

In general, the archaeological investigation conducted for the alternatives analysis phase of the project does not appear to have contributed to the identification of a preferred alternative. Because of numerous factors (development, erosion, deposition of modern fill, among others), the archaeological investigation was focused on a few, very small sample areas within the APE. For an undertaking of this magnitude, the archaeological investigation conducted to date does not constitute an adequate sample to identify resources that might exist within the APE. While the consultant did indicate that Segments B, D, and E traverse areas that appear to be archaeologically sensitive, it is unfortunate that insufficient survey was conducted to provide meaningful assistance in the alternatives selection process. Once a preferred alternative is selected, additional review will be required to determine how best to augment this phase of archaeological investigation with additional survey and/or testing to determine overall project effects.

Based on the comments presented above, DAHP does not concur with FTA's determination of no adverse effect (December 2, 2008) for the project. At a minimum, additional review will be required as construction design/engineering plans are refined and as a preferred alternative is selected.

Thank you for the opportunity to review and comment. If you have questions or comments about anything contained in this letter, please don't hesitate to contact me. We look forward to working closely with you and Sound Transit in the continuing evaluation and review of this project.

Sincerely,

Matthew Sterner, M.A., RPA

Re: Notification of Geotechnical Monitoring within the APE

Dear Mr. Krochalis:

Thank you for contacting the Washington State Department of Archaeology and Historic Preservation (DAHP). The maps and materials regarding Sound Transit's intent to conduct geotechnical monitoring with the East Link Project, Seattle to Bellevue to Redmond project area of potential effect have been reviewed on behalf of the State Historic Preservation Officer under provisions of Section 106 of the National Historic Preservation Act of 1966 (as amended) and 36 CFR Part 800. My review is based upon documentation contained in your communication.

We concur with the use of an archaeological monitor in areas that are considered potentially sensitive for the presence of archaeological resources. Thank you for consulting with us as the project moves forward. We would appreciate receiving any correspondence or comments from concerned tribes or other parties that you receive as you consult under the requirements of 36CFR800.4(a)(4).

Please note that DAHP has developed a set of cultural resource reporting guidelines. Please provide us with a copy of the archaeological monitoring report once the geotechnical work is completed. Contact us immediately if any cultural resources are identified during the monitoring process. Thank you for the opportunity to review and comment.

Sincerely,

Re: Determined Eligible / No Adverse Effect

Dear Ms. Walker Gray:

Thank you for contacting our office. I have reviewed the materials you provided to our office regarding the Traffic Management Project. I concur with your professional opinion that the I-90 Bridge from mile post 3.44 to 8.9 is exceptionally significant and eligible to the National Register of Historic Places under Criterion A, C and G. The NR nomination, as prepared, provides a good overall context and justification for the significance of this resource.

I also concur with your assessment on the APE and the assessment that as proposed the project which involves the installation of gantries and signage, will have No Adverse Effect on Historic properties.

These comments are based on the information available at the time of this review and on behalf of the State Historic Preservation Officer pursuant to Section 106 of the National Historic Preservation Act and its implementing regulations 36CFR800.

Thank you for the opportunity to review and comment. Should you have any questions, please feel free to contact me.

Re: Additional Eligibility Determinations

Dear Matt:

Pursuant to the National Historic Preservation Act Section 106 and its implementing regulations, the Federal Transit Administration (FTA) is transmitting the enclosed 60 new Historic Property Inventory forms (HPI) for Sound Transit's East Link Project. Please review the forms for eligibility to the National Register of Historic Places (NR). The additional forms enclosed were not included as part of the earlier consultation process for a variety of reasons including inconsistencies in the King County assessor's database and refinements to project alternatives.

These HPI forms have been prepared by Historical Research Associates, Inc. Based on their evaluation and analysis, none of the structures are considered eligible for listing to the NR. The HPI form for Field Site 1256-274 at 69 110th Ave SE is being resubmitted to include a new description, which clarifies that the structure is likely associated with the architects Mithun and Nesland. However, the structure remains a non-contributor to a potential Surrey Downs historic district because of its lack of integrity due to alterations and loss of original setting.

If you have any questions, please contact John Witmer at (206) 220-7964 or Elma Borbe at Sound Transit at (206) 398-5445.

Sincerely,

Linda M. Gehrke

Re: Determined Eligible

Dear Mr. Krochalis:

Thank you for contacting our office. I have reviewed the 60 new inventory forms and 5 updated forms you provided to our office for the Sound Transit East Link – Seattle to Bellevue to Redmond project.

I do not concur with your consultant that none of the surveyed properties are eligible for the National Register of Historic Places. I have determined that the following resources are ELIGIBLE for the National Register of Historic Places under criteria C as properties that embody the distinguishing characteristics of their type and period of construction, as well as possess high artistic values.

These include:
115 109th Ave SE;
109 109th Ave SE; (Swallwell Residence)
414,424,456 104th Ave NE (Safeway Store); and
88 110th Ave SE. (Kim Residence)

These comments are based on the information available at the time of this review and on behalf of the State Historic Preservation Officer pursuant to Section 106 of the National Historic Preservation Act and its implementing regulations 36CFR800.

I look forward to consulting with you further as to any potential effects your projects may have on these eligible resources.

Re: More Information Needed

Dear Mr. Krochalis:

Thank you for contacting our office. I have reviewed the archaeological site forms for 45KI451 and Site 1256-1 (a temporary designation) that you provided for this project. I can concur at this time with your determination that archaeological site 45KI451 is **not eligible** for listing in the National Register of Historic Places (NRHP). However, in order to complete our review we request the following material to be provided to our office:

- I am unable to process archaeological site forms that do not have Smithsonian trinomial designations assigned to them. Please have your consultant contact Ms. Morgan McLemore (360.586.3081) to obtain a trinomial designation and then resubmit the site form for eligibility concurrence.

I would appreciate receiving any correspondence or comments from concerned tribes or other parties that you receive as you consult under the requirements of 36CFR800.4(a)(4) and the survey report when it is available.

These comments are based on the information available at the time of this review and on behalf of the State Historic Preservation Officer pursuant to Section 106 of the National Historic Preservation Act and its implementing regulations 36CFR800. Please contact me should you have any specific questions about our request and we look forward to receiving this material.

Please note that DAHP requires that all historic property inventory and archaeological site forms be provided to our office electronically. If you have not registered for a copy of the database, please log onto our website at www.dahp.wa.gov and go to the Survey/Inventory page for more information and a registration form.

Thank you for the opportunity to review and comment. If you have any questions, please feel free to contact me.

Re: Additional Eligibility Determinations

Dear Matt:

Pursuant to the National Historic Preservation Act Section 106 and its implementing regulations, we are continuing consultation on the above-reference project. We are re-submitting Archaeological Site Form Site 45KI451 for eligibility concurrence. We had originally submitted this site with a temporary name "Site 1256-1." However, you were unable to process it because it did not have the Smithsonian trinomial designations. Please review the site for eligibility to the National Register of Historic Places (NR). This site form has been prepared by Historic Research Associates, Inc. and based on their evaluation and analysis, this site is not considered eligible for listing to the NR. We look forward to your comment on the eligibility determination and to your concurrence that this site is not eligible. If you have any questions, or need additional information, please call John Witmer, FTA Community Planner, at (206) 220-7964 or Elma Borbe, Sound Transit Environmental Planner, at (206) 398-5445.

Subject: East Link Archeological Resources Technical Report, No Comments From King County Metro Transit

Hi Elma -- This is to confirm that King County Metro Transit does not have any comments on the East Link Archeological Resources Technical Report (Appendix H4 to the East Link Final EIS), and we do not have any concerns with regard to the Winter House Adverse Effect during the construction phase. As we discussed, there is an error in the listing of King County as the owner of the South Bellevue P&R, parcel number 7000100360 in Appendix C (Stage 1 Survey Tract Table) to Appendix A (Archaeological Survey Plan); the owner is actually WSDOT, although we do not have a copy of the deed. Thank you, and nice talking with you!

P.O. Box 90012 • Bellevue, WA • 98009-9012

Via Facsimile and Regular Mail

R.F. Krochalis
Regional Administrator
Federal Transit Administration
915 Second Avenue, Suite 3142
Seattle, WA 98174-1002

Dear Mr. Krochalis:

Thank you for the invitation to participate as a consulting party under the Section 106 process for the East Link light rail project. The City of Bellevue is extremely interested in potential impacts to historic resources throughout the community, including the F.W. Winters House, which the City owns and operates. Eastside Heritage Center, our partner in operating historic programming in and around the Winters House, is also potentially impacted if the final East Link light rail alignment causes construction-period or operational impacts to the Winters House.

The City has recorded a series of comments regarding potential historic impacts in previous correspondence to Sound Transit during the East Link Environmental Impact Statement process. For your convenience, although already a part of the record for your consideration, a collection of those comments specific to Winters House in attached to this letter. In summary, the City has expressed concern about:

- potential physical impacts to the structure during construction and the effectiveness of proposed mitigation;
- potential long-term vibration and ground-borne noise impacts during operation;
- impacts for the City and the Eastside Heritage Center associated with the multi-year closure of the facility during construction; and
- permanent impacts to the setting of the house caused by the retained cut and the reconstructed and raised parking lot and access stairs and ramps within the 50 foot boundary around the house established for the National Register of Historic Places and the effectiveness of proposed mitigation.

As you can see from the more detailed comments in the attached, the City does not necessarily agree that all alternatives described in the DEIS and SDEIS, other than B2M, avoid impacts to the Winters House and needs more information to draw such conclusions.

In light of these concerns, the City welcomes the opportunity to participate in the Section 106 process by reiterating these comments and by participating in further discussion of impacts and mitigation through the Memorandum of Agreement (MOA) process. As owner of the Winters House, the City should be actively involved in developing ways to avoid, minimize and mitigate project impacts. We believe such issues can be most effectively addressed during the development of the MOA, rather than through formal comments after a draft MOA is published with the project Final Environmental Impact Statement. In light of the State Historic Preservation Officer's expertise on historic resources and knowledge about this project and the Winters House, we would like to take this opportunity to suggest that a meeting between the agencies, SHPO and the City would be quite beneficial early in the process of outlining the contents of any MOA.

I would also like to take this opportunity to request clarification from the FTA regarding completion of the separate 4(f) analysis of impacts of the East Link light rail project on properties protected by 4(f). The Winters House, both as an historic resource and as a part of the larger Mercer Slough Nature Park is also subject to protection under the separate 4(f) process. A number of other city-owned resources, including Mercer Slough Nature Park, Surrey Downs Park and NE 2nd Place Pocket Parks are also protected under Section 4(f). Until recently, the City was under the impression that it would be asked to formally concur in a *de minimis* determination of impact under Section 4(f) for most of these resources. In order to prepare for that discussion, City and Sound Transit staff were engaged in a more detailed analysis of impacts on 4(f) resources and potential mitigation for those impacts, beyond the level of detail included in the Agency's DEIS and SDEIS, but had reached no conclusions in those discussions, nor had the City concluded that a *de minimis* determination was appropriate for some or any of the resources impacted by East Link light rail.

The City now understands that a *de minimis* concurrence will not be requested, and instead that FTA and Sound Transit are preparing an alternatives analysis for 4(f) resources. The City is requesting clarification of when and how it will be invited to participate in that alternatives analysis. Again, as the affected jurisdiction with authority over these parks resources, we believe that the City's participation early in the process will be of critical importance to both the FTA and Sound Transit. The City has yet to make any final determinations on the relative impacts of the East Link light rail alignment alternatives on its parks resources, and such determinations will be critical to FTA's ultimate conclusion in the 4(f) alternatives analysis. In order to effectively and efficiently conclude the 4(f) process, the City is seeking guidance on how to participate proactively with Sound Transit and FTA in identifying specific parks impacts and mitigations. Thank you in advance for your detailed response to this request for guidance on the 4(f) process. Your response will allow us to ensure that the City can include all stakeholders in assessing impacts and mitigation and providing input to the FTA.

Please feel free to contact me if you have any questions about the City's comments to date or the requests that we have included in this letter.

Sincerely,

Historic Resource – Related Comments from City of Bellevue
Attachment to May 23, 2011 Letter to FTA
Section 106 Process

July 20, 2010 letter from Bellevue City Council to Sound Transit Board of Directors

"...B2M light rail right of way runs mere feet from the structure of the F.W. Winters House, Bellevue's only property on the National Historic Register. The light rail alignment runs so close to the house that damage to the house from construction and train vibration will almost certainly damage the house over time and will negatively alter the character and use of this historic structure."

January 10, 2011 East Link SDEIS Comments Letter

"The potential for damage to the Winters House is a significant issue for Bellevue. According to the City's consultant (Greenbush, Final SDEIS Peer Review, 12/29/2010), "Predicted levels of vibration at the winters House during the excavation of the trench are at the threshold for damage to a sensitive structure." The SDEIS identifies "special measures" and monitoring during construction and the City will e seeking additional assurances from Sound Transit prior to construction."

DEIS Comments

Segments B and C contain significant cultural/historical resources for the City of Bellevue. Considering the relatively small number of features in Bellevue that are of significant cultural/historical value, these features are extremely important for preservation and would be extremely difficult to mitigate for.
The visual analysis in Appendix F4.5, Table 2 shows an overall change from high to medium visual quality for Bellevue Way Southeast between the South Bellevue Park and Ride and SE 8th Street, caused by Alternatives B1, B2A, B2E and B3. This impact is described as follows, "The introduction of light rail components would lower the undeveloped, almost rural landscape character of this section of Bellevue Way SE." The Winters House is located within this segment. In other sections of the DEIS that describe impacts to the Winters House, this visual analysis is either minimized or disregarded.

SDEIS Comments

Winters House serves as more than just offices of Eastside Heritage Center. The house includes office space for Bellevue Parks staff, hosts community events and programs as well as the historical archive of the EHC. It is also a key part of the Heritage Loop Trail, offering historical interpretation and facilities for park trail users.
Winters House discussion makes no mention of the need to preserve the number of existing parking spaces.
It is not accurate to claim the existing landscaping "does not in any way reflect the house's original landscape." Beside viewing a limited number of photographs, this statement is not adequately researched. Further, the landscaping today remains similar to the landscape in 1991, when the 50-foot

buffer was proposed and approved. With no significant change since 1991 the reasons for including that area 50-feet around the house in 1991 remain valid today.
Historic and Archeological Resources section does not disclose or analyze impacts of the reconstructed parking lot and associated retaining walls and ramps that fall within the 50' historic boundary of the house.
"The roadway would be the same distance from the house." This is technically accurate but misleading, as Exhibit 3-9 shows the sidewalk moving approximately 5 feet closer to the house due to the new proposed sidewalk.
By not disclosing or analyzing the impacts of the increased paved areas and reconstructed parking lot within the 50-foot area of significance, it is not accurate to claim no impacts to the existing landscape.
"EHC offices would be temporarily relocated" due to closure of Winter House during construction. How would other activities within Winters House be mitigated during closure (City office space, event rentals, trail facilities, EHC/City programs, EHC archive space, etc.)?
If B2M is selected as the preferred alternative, a more refined study of construction vibration at the Winters House should be conducted to ensure the methods for both construction and operation do not put this historic house at risk.
Ground-borne noise impacts have been identified at the Winters House with operation. Analysis concludes that a floating slab would eliminate the impact. Need firm commitment from Sound Transit in FEIS that impact will be mitigated, which appears to mean a commitment to using a floating slab.
"Constructing B2M would not substantially affect park use..." The project would close the majority of park parking, close the Winters House, and limit pedestrian access to the Heritage Loop Trail and trailhead facilities at Winters House and the Blueberry Farm. Per Section 4(f), these actions temporarily interfere with the protected activities and features of the park and historic resource (23 CFR 774.13(d)(3)) and appear to constitute a temporary 4(f) use. With the exception of relocating the Periphery Loop Trail, mitigation is not proposed for other temporary impacts.
The activities of Winters House are not fully described. In addition to housing the Eastside Heritage Center, the house includes office space for Bellevue Parks staff, hosts community events and programs as well as the historical archive of the EHC. It is also a key part of the Heritage Loop Trail, offering historical interpretation and facilities for park trail users. The house should be considered as both a 4(f) protected historic resource and as a 4(f) protected facility within public parkland.
"Bellevue Way SE and the sidewalk would remain the same distance from the house." This is not supported by A-8, which shows the sidewalk approximately 5 feet closer to the house.
Although the home's garage is not used for vehicle storage at the present time, vehicle access to the garage of the house has been maintained since the period of historic significance. The lid will not longer allow vehicle access to the garage. This limitation should be considered in the historic impact analysis.
The reconstructed parking lot serving the Winters House and the Heritage Loop Trail trailhead is not discussed in the 4(f) analysis even though it presents a significant temporary interference to one of the primary parking areas for the park as well as extending within the 50 foot historic designation boundary of the Winters House. This new structure within the park deserves analysis as a potentially a 4(f) temporary use and 4(f) historic impact.
The mitigation measures as described in Table A-5 are not sufficient in scope or detail to judge the appropriateness of de minimis determinations for the Section 4(f) temporary uses and permanent uses of impacted park land or historic resources within Mercer Slough Nature Park or Surrey Downs Park.
The temporary 4(f) use of the Winters House as a historic resource is not adequately analyzed in the SDEIS. As per the FHWA Section 4(f) Policy Paper, in a situation where a resource does not meet all the exemption criteria at 23 CFR 771.135(p)(7), "the temporary occupancy will be considered a use of the 4(f) resource and the appropriate Section 4(f) analysis will be required." (Policy Paper, p. 11, Question

C.). The third exemption criteria states that the project will not interfere with the activities or purpose of the resource on a temporary basis. This would also apply to the use of the Winters House as a Section 4(f) protected recreational facility as well as a protected historic resource.

Subject: City of Redmond Comments to East Link Light Rail Project, Historic and Archaeological Resources Technical Report: Determination of Adverse Effect

Dear Mr. Krochalis;

Thank you for the opportunity to review the Historic and Archeological Resources Technical Report for the East Link Project Final EIS. We apologize for the late response.

During the past three years, the City has worked with King County to formally recognize the City's landmarks. In 2005, King County inventoried and classified historic properties in Redmond's vicinity.

The recommended amendments to Appendix H4 are based on this inventory and other historic resources such as Redmond Historical Society archives. The attached list provides our recommended classification of sites to be reflected on Exhibit C-12. This list includes properties both inside and adjacent to the area of potential affects. For reference and for noting on Exhibit C-12, the attached list also includes locations (without structures) that are of significant historic interest within the indicated area of potential effects: the Redmond Railway Depot, Lampaert's Butcher Shop, and Youngerman's General Store.

We also note the following respective portions of the appendix:

- Exhibit C-12, Redmond Trading Company – shown as 113 Redmond Trading Company is a Redmond (only) Landmark and contains two historic buildings. Per original plats, two structures and an 11-foot wide alley were incorporated into the Trading Company structure.
- Exhibit C-12, Grange Coop/ T&D Feed Mill – shown as 115. It is difficult to tell if Property 115 refers to T&D Feed or the Grange Coop. If T&D Feed, this site was demolished. The map could note this site as a previous location of historic significance.

- Exhibit C-12, Haida House – shown as 118. Haida House Studio is a Redmond Landmark and additional consideration is underway regarding Regional landmark designation.
- Page 7-28, line 3, Haida House – Please note that King County staff also support eligibility for Regional landmark designation.

Thank you for your consideration of our comments. Please contact me at 425-556-2415 or kdietz@redmond.gov with any questions.

Sincerely,

Kimberly Dietz, Senior Planner (Historic Preservation Program)

Re: Historic and Archaeological Resources Technical Report: Affect Determination
Determination of Adverse Effect

Dear Dr. Brooks:

In accordance with Section 106 of the National Historic Preservation Act, as amended (16 U.S.C 470f), and implementing regulations 36 CFR 800.6(a) (1) and as part of the continuing consultation, the Federal Transit Administration (FTA) submits to you for review and comment our Determination of Adverse Effect on Section 106 resources for the East Link Light Rail Project. This determination is based on the enclosed East Link Historic and Archeological Report and comments received during the public comment period received on the East Link *Supplemental* Draft Environmental Impact Statement (DEIS) of 2010.

The project proponent is the Central Puget Sound Regional Transit Authority (Sound Transit). FTA is participating in this undertaking to extend light rail service approximately 18 miles from downtown Seattle to serve the regional destinations of Mercer Island, Bellevue, Overlake, and Redmond.

In prior correspondence dated August 24, 2006 and July 3, 2007, FTA provided initial notification to you of this federal action and of the proposed Area of Potential Effect (APE). By your letter of July 13, 2007, you concurred with the proposed APE. In addition, in correspondence dated August 24, 2006, the Muckleshoot, Suquamish, Yakama, Snoqualmie, Tulalip, and Duwamish Indian tribes were notified of the project and invited to participate.

Based on the enclosed East Link Historic and Archeological Report, enclosed comments submitted by interested parties with views about historic resources associated with East Link, along with comments received during the public comment periods for the Draft EIS and *Supplemental* Draft

EIS, FTA has determined that the East Link Light Rail Project Preferred Alternative would have an Adverse Effect on Section 106 resources. As a result of the finding of Adverse Effect, FTA will execute a Memorandum of Agreement (MOA) with the State Historic Preservation Officer (SHPO) pursuant to the requirements of Section 106. FTA requests the SHPO's concurrence on this determination. FTA will also provide copies of the Technical Report and adverse effect determination to the consulting Indian tribes and agencies with jurisdiction over the area including: the Federal Highway Administration, the Washington State Department of Transportation, the cities of Bellevue, Mercer Island, Redmond, and Seattle and King County.

If you have any questions, please call John Witmer, Community Planner, at (206) 220-7964.

Sincerely,

Re: ADVERSE Effect

Dear Mr. Krochalis:

Thank you for contacting the Department of Archaeology and Historic Preservation (DAHP). We have reviewed the final EIS and subsequent adjusted pages (May 2011, based on our telephone conversations) you provided for the Seattle-to-Bellevue-to-Redmond East Link Project for Sound Transit. We concur with your determination that the project, as proposed, will have an Adverse Effect on eligible and/or listed historic properties. We also concur that various resources within the APE (as defined on Table 9-1 in the FEIS) may be impacted dependent on which alternative is chosen by Sound Transit.

We look forward to further consultation and the development of a Memorandum of Agreement (MOA) to address this Adverse Effect and the individual impacts that may or may not occur based on which alternative is chosen.

Thank you for the opportunity to review and comment. If you have any questions, please contact me.

Sincerely,

Michael Houser
State Architectural Historian

Draft Memorandum of Agreement

DRAFT

MEMORANDUM OF AGREEMENT

AMONG

THE FEDERAL TRANSIT ADMINISTRATION,

WASHINGTON STATE HISTORIC PRESERVATION OFFICER,
AND THE CENTRAL PUGET SOUND REGIONAL TRANSIT AUTHORITY

Implementing

Section 106 of the National Historic Preservation Act

for the

EAST LINK LIGHT RAIL TRANSIT PROJECT
IN THE STATE OF WASHINGTON

DRAFT

WHEREAS, the Central Puget Sound Regional Transit Authority (Sound Transit) proposes to construct and operate the East Link Light Rail Transit Project (Project), an extension of its electric light rail transit system, that will connect the cities of Seattle, Mercer Island, Bellevue, and Redmond, crossing Lake Washington in the center lanes of Interstate 90 (I-90) and operating in a dedicated right-of-way between Seattle and Redmond; and

WHEREAS, the Federal Transit Administration (FTA), the responsible Federal agency, has determined that the Project is an undertaking, as defined in Title 36 Code of Federal Regulations (CFR) §800.16(y), and thus is subject to review under Section 106 of the National Historic Preservation Act (NHPA), 16 U.S.C. §470f and its implementing regulations, 36 CFR Part 800; and

WHEREAS, Sound Transit is the designated applicant responsible for obtaining the necessary approvals and permits to undertake the Project; and

WHEREAS, FTA and Sound Transit have consulted with the Washington State Historic Preservation Officer (SHPO), interested and affected Indian tribes, and other parties with a demonstrated interest in the effects of the Project on historic properties in accordance with Section 106 of the National Historic Preservation Act (16 USC 4701) and its implementing regulations (36 CFR Part 800.2); and

WHEREAS, FTA and Sound Transit, in consultation with SHPO, have determined the appropriate area of potential effects (APE) for the Project and conducted cultural resource studies constituting a reasonable and good faith effort to identify historic properties and archaeological resources within the APE pursuant to 36 CFR §800.4; and

WHEREAS, the APE and potential historic properties within the APE are described in the Sound Transit East Link Project Historic and Archaeological Resources Technical Report, along with a description and map of the Project; and

WHEREAS, the cultural resource studies resulted in the identification of 16 properties within the APE listed in or eligible for listing in the National Register of Historic Places (NRHP), including a neighborhood (Surrey Downs) that is potentially eligible for listing in the NRHP; and

WHEREAS, as federally recognized tribes, the Muckleshoot Indian Tribe, the Snoqualmie Indian Tribe, the Suquamish Indian Tribe, the Tulalip Tribes of the Tulalip Reservations, and the Confederated Bands and Tribes of the Yakama Nation (the Tribes) have been consulted about the Project and have been invited to concur with this Agreement; and

WHEREAS, the Duwamish Tribal Services (a non-profit organization) has been consulted about the Project and has been invited to concur with this Agreement; and

WHEREAS, FTA and Sound Transit have completed a traditional cultural properties (TCP) archival inventory of the APE using secondary sources and information available in the public domain, and identified no property of cultural interest to the Tribes ; and

WHEREAS, FTA and Sound Transit have consulted about the project with the cities of Seattle, Mercer Island, Bellevue, and Redmond, King County, Washington State Department of Transportation, Federal Highway Administration, and US Army Corps of Engineers, and have invited those entities to concur with this Agreement; and

WHEREAS, FTA and Sound Transit have coordinated the investigations, studies and consultations described above required under Section 106; and

WHEREAS, FTA and Sound Transit have determined that the Project will have an adverse effect, which results from a potential impact on the Winters House, and on the potentially eligible Surrey Downs Historic District, and has the potential to have an impact on undiscovered archaeological resources; and

WHEREAS, FTA and Sound Transit carried out consultations with SHPO, interested and affected Indian tribes, and other consulting parties to identify measures to resolve impacts pursuant to 36 CFR §800.6, resulting in development of this Agreement; and

NOW, THEREFORE, FTA, SHPO, and Sound Transit agree that the Project shall be implemented in accordance with the following stipulations to satisfy FTA's Section 106 responsibilities, and they further agree that FTA shall require that the following terms and conditions be carried out.

STIPULATIONS

FTA and Sound Transit shall implement the following terms and conditions in a timely manner and with adequate resources in compliance with the NHPA (16 USC 470).

DRAFT

DRAFT

During the environmental review for this Project, conceptual engineering plans and conceptual station designs were reviewed for potential impacts on identified historic properties. These conceptual plans and designs, and the potential impacts they describe, are included in the East Link Light Rail Transit Project Final Environmental Impact Statement (FEIS July 2011) and the Archeological and Historic Resources Technical Report to the FEIS. The following stipulations will govern future design, construction, and operation of the Project.

I. WINTERS HOUSE

A. Sound Transit will perform a conditions assessment of the Winters House building to establish existing conditions, including exterior and interior inspection.

B. Sound Transit will install vibration and settlement monitoring devices before undertaking ground-disturbing construction sufficient to provide the necessary monitoring and measurements to alert Sound Transit. Where called for, Sound Transit will adjust construction methods as needed based on monitoring results.

C. Sound Transit will use specific vibration and settlement-reducing construction methods, to be determined by Sound Transit during final design and construction.

D. If warranted, Sound Transit will build a construction barrier around the Winters House building to minimize damage and minimize dust during construction. This will be determined by Sound Transit during final design and construction.

E. Sound Transit will apply dust control measures during construction to minimize dust. After construction, in consultation with SHPO, Sound Transit will clean the outside of the Winters House building and windows in a manner sensitive to the historic property.

F. The Winters House will be closed during construction and Sound Transit will temporarily relocate the tenant. For the duration of the time the Winters House is closed, Sound Transit will provide information to the public regarding how to access the Eastside Heritage Center during construction.

G. If any physical damage occurs to the Winters House building as a result of the Project, Sound Transit, in consultation with SHPO, will make any necessary repairs consistent with U.S. Secretary of the Interior’s Standards for the Treatment of Historic Properties.

H. Sound Transit will install standard methods of vibration reduction, such as resilient fasteners or ballast mats, to reduce groundborne noise below FTA impact criteria. A floating slab will be incorporated in the project, if necessary, to eliminate groundborne noise and vibration impacts. This will be determined by Sound Transit in consultation with FTA during final design and construction.

I. Within six months after construction of the Project is completed, Sound Transit will landscape the area of property between the front (west elevation) of the Winters House and Bellevue Way SE to more closely reflect the landscaping of the historic period, in consultation with the City of Bellevue and SHPO. Sound Transit will preserve, as practical, historic period plants that will be affected by Project construction.

J. Sound Transit will provide interpretive signage on or near the Winters House property in consultation with the City of Bellevue.

II. POTENTIAL SURREY DOWNS HISTORIC DISTRICT

A. To minimize construction impacts, the following minimization measures will be incorporated into the Project during construction adjacent to properties that contribute to the potential Surrey Downs Historic District:

1. Before construction begins, Sound Transit will install a solid construction barrier south of Main Street between the area of construction activity and adjacent contributing properties.

2. During construction, Sound Transit will comply with the City of Bellevue's Noise Ordinance. Other construction impact minimization measures, including dust control, will be implemented as needed.

3. Sound Transit will remove the construction barrier and will install landscaping along the south side of the guideway south of Main Street within six months after completion of construction.

4. As practical, Sound Transit will preserve the evergreen trees located between the contributing historic properties and proposed project south of Main Street and east of 108th Avenue SE.

5. Reasonable mitigation measures shall be employed for construction-related activities occurring on adjacent property used by Sound Transit for "construction staging" to address noise, dust, visual and other such impacts in recognition of the neighboring residential setting.

B. To minimize impacts during operation, the following measures will be incorporated into the Project

1. Sound Transit will install a permanent sound barrier, which may include a berm and/or wall, south of the light rail track along Main Street to prevent noise impacts on contributing properties within the potential Surrey Downs Historic District. The SHPO will be consulted for sound barrier design prior to its construction.

2. Sound Transit will install landscaping along the south side of the guideway south of Main Street to provide a buffer for the boundary of the potential Surrey Downs Historic District where noncontributing properties would be removed for the Project.

III. ARCHAEOLOGY

A. Project archaeologists who meet the Secretary of Interior's professional standards will conduct additional subsurface testing before construction as outlined in the Archaeological Survey Strategy (which is included in the Historic and Archaeological Technical Report).

B. An Archaeological Resources Monitoring and Treatment Plan or an Unanticipated Discovery Plan will be prepared before construction to provide additional information and protocols that will guide archaeological monitoring work during Project construction.

DRAFT

IV. DISPUTE RESOLUTION

A. FTA, Sound Transit, and SHPO are signatories to this agreement and are the parties who are authorized to address and informally resolve disagreements concerning the implementation of this Agreement.

B. If informal resolution cannot be achieved, any signatory to this Agreement may object in writing to FTA or Sound Transit regarding any action carried out or proposed with respect to implementation of this Agreement. The agency receiving the objection shall, within ten working days, initiate consultation with the objecting party to resolve the objection.

C. If after initiating such consultation FTA or Sound Transit determines that the objection cannot be resolved through consultation, FTA shall forward all documentation relevant to the objection to the Advisory Council on Historic Preservation (ACHP), including the agency's proposed response to the objection.

D. Within thirty calendar days after receipt of all pertinent documentation, ACHP shall exercise one of the following options:

1. Advise FTA that ACHP concurs in the agency's proposed response to the objection, whereupon FTA will respond to the objection accordingly; or

2. Provide FTA with recommendations, which the agency shall take into account in reaching a final decision regarding its response to the objection; or

3. Notify FTA that the objection will be referred for comment pursuant to 36 CFR §800.7(a)(4), and proceed to refer the objection and comment.

E. FTA shall take the resulting comment into account in accordance with 36 CFR §800.7(c)(4), with reference only to the subject of the specified dispute; FTA's responsibility to ensure that all actions under this Agreement that are not the subjects of the dispute are carried out will remain unchanged.

V. AMENDMENT AND TERMINATION

A. FTA, Sound Transit, and SHPO are signatories to this agreement and are the parties who are authorized to terminate it by providing 30 calendar days written notice to the other parties. If requested by a signatory, the signatories may meet during the period prior to termination to seek agreement on amendments or other actions that would avoid termination.

B. In the event of termination, FTA shall comply with 36 CFR 800 with regard to all remaining actions under this Agreement.

C. If FTA or Sound Transit proposes to modify this Agreement in a manner that alters the resolution of adverse effects of historic properties, the modified Agreement must be signed by all signatories.

DRAFT

VI. CONSULTATION UNDER SECTION 106

A. FTA notified the ACHP of a potential adverse effect of the Project on properties listed in or eligible for listing in NRHP, affording ACHP an opportunity to comment and/or participate in resolving adverse effects. ACHP has declined to participate in the consultation to resolve adverse effects. The executed MOA will be filed with the ACHP, pursuant to 36 CFR 800.6(b)(I)(iv), when signed by the parties below.

B. Execution and implementation of this Agreement is evidence that FTA and Sound Transit have taken into account the effects of the Project on historic properties and afforded the ACHP an opportunity to comment on those effects, and is evidence that FTA and Sound Transit have complied with the consultation requirements under Section 106.

VII. EXECUTION

A. Unless terminated, this MOA shall remain in effect from the date of execution until FTA determines that the terms of this MOA have been satisfactorily fulfilled. Upon such determination, this MOA shall terminate, and FTA shall provide SHPO with written notice of the determination and termination.

B. The undersigned official representatives of the parties affirm and concur with the agreement and enter into this agreement on behalf of their respective parties. Each party represents that the person executing this agreement on its behalf is duly authorized to execute this agreement.

VIII. MISCELLANEOUS

This MOA creates no right of action for any signatory to this agreement or any other party.

Executive Summary

The following report has been prepared pursuant to Section 106 of the National Historic Preservation Act as amended (16 U.S.C. 470f) and implementing regulations 36 CFR Part 800, which stipulates that projects that involve federal money, permits, and/or licenses must take into account the effect of the undertaking on any district, site, building, structure, or object that is included in or eligible for inclusion in the National Register. This technical report presents the eligibility of historic and archaeological resources, effects analysis and findings, along with commitments to avoid, minimize, and mitigate impacts.

As part of the project's historic environmental review, 439 buildings or structures, cultural investigations, and two archaeological sites located within the Area of Potential Effect (APE) were documented and analyzed. Of this total, 12 buildings or structures have been found to be listed or eligible for the National Register of Historic Places (NRHP). The Federal Transit Administration (FTA), in consultation with the State Historic Preservation Office (SHPO), has made a determination of adverse effect for the project. This determination results from the preferred alternative's potential impacts on the Winters House and potential Surrey Downs historic district. Other alternatives would also impact the potential Surrey Downs historic district and Justice White House.

Project Overview

East Link project is an extension of the light rail system from Seattle, Mercer Island, and the east side of Lake Washington to Bellevue and Redmond. The corridor is approximately 18 miles long and has been divided into five segments: Segment A, Interstate 90 (Seattle, Mercer Island to Bellevue); Segment B (I- 90 to Downtown Bellevue); Segment C (Downtown Bellevue); Segment D (Downtown Bellevue to Overlake Transit Center); and Segment E (Overlake Transit Center to Downtown Redmond). From the 28 different alternatives considered in these segments, the Sound Transit Board has identified a combination of Alternatives A1, B2M, C11A or C9T, D2A, and E2, as the *Preferred Alternative*.

Archaeology

Several portions of the alternatives have a high sensitivity for prehistoric archaeological sites, while no high sensitivity historic-period archaeological sites were identified. Archaeological investigations were conducted on 25 survey tracts. The surveys located no NRHP-eligible prehistoric or historic-period archaeological sites in the APE.

Additional archaeological surveys would be conducted prior to construction. In addition, an Archaeological Resources Monitoring and Treatment Plan (ARMPT) or an Unanticipated Discovery Plan would be prepared to guide archaeological monitoring during East Link construction. The Federal Transit Administration (FTA) and Sound Transit would consult with the Washington State Historic Preservation Officer (SHPO), the Muckleshoot and Snoqualmie Tribes, and other interested parties as appropriate, to review this plan.

Historic Resources

Project historians analyzed 439 buildings and structures for eligibility to the National Registrar. Of the total inventoried properties (including one potential historic district), 12 properties were either listed in the NRHP or recommended to be eligible to the NRHP. The Table ES-1 lists the 12 historic properties, findings of eligibility and impacts for each resource, along with minimization and mitigation measures. The resources that are "bold and italicized" are located along the *Preferred Alternative*. For the *Preferred Alternative*, a potential impact could occur at the Winters House and the potential Surrey Downs historic district during construction. The *Preferred Alternative* would not result in any other impacts on any other historic resources.

The project alternatives avoid all of the listed or eligible resources within the APE with the following exceptions. In Segment A, the *Preferred Alternative* would be located within the center roadway of the historic segment of I-90. The *Preferred Alternative* would not impact I-90 because light rail would maintain its character defining features and because this segment of I-90 was originally designed to accommodate high capacity transit including light rail.

Preferred Alternative B2M would be located in a lidded retained cut under the front yard of the Winters House. Project construction includes measures to minimize damage to the house. If damage does occur, Sound Transit would make the needed repairs consistent with U.S. Secretary of the Interior's standards for treating historic properties. The Winters House will be closed during construction and the existing tenant temporarily relocated. The proximity of the light rail to the house creates the potential for groundborne noise above the FTA criteria during light rail operations. Project design would include vibration-reducing track work to mitigate this impact. Implementing these measures would resolve the project's potential impacts on the Winters House.

Preferred Alternative B2M also would benefit the historic features of the Winters House. The proposed mitigation for the Winters House would improve its visual and physical context. Following construction, and in consultation with the City of Bellevue, more historically appropriate landscaping would be planted over the lidded retained-cut with a net benefit to the historic home. The Winters House today lacks sufficient or appropriate signage providing information about its history and historic significance. Sound Transit would also provide new interpretive signage on or near the Winters House property.

Preferred Alternative C11A is located adjacent to three contributing properties within the potential Surrey Downs historic district. Operations of the project would not diminish the historic setting within the potential Surrey Downs historic district, which is already located in a highly developed area. A landscaped berm and permanent sound barrier would be constructed between the station and the potential Surrey Downs historic district, providing a visual buffer and mitigating operational noise impacts. Construction adjacent to the potential district has potential impacts without implementation of appropriate minimization techniques including installing a solid construction barrier, and preserving the evergreen trees along the south edge of the proposed station, as practical.

Alternative E4, which is not a *Preferred Alternative*, would sustain an impact because the Justice White House would need to be relocated.

TABLE ES-1
Historic Properties within Project Area of Potential Effect, Eligibility, and Effect Findings

Segment	Map ID	Property Name/Type	Address	Register Status	Avoidance Minimization Mitigation	Impact Findings
A, Interstate 90	376	Publix Hotel (Seattle Chinatown NRHP/ International Special Review historic district)	504 5th Avenue South	Contributing element to NRHP and Seattle Special Review historic districts	Project avoids resource.	No Impact
	132	Immigrant Station and Assay Office	815 Airport Way South	NRHP, WHR, eSL	Project avoids resource.	No Impact
	303	Jose Rizal 12th Avenue South Bridge	12th Avenue South crossing of South Dearborn Street	NRHP, WHR, eSL	Project avoids resource.	No Impact
	166	Will H. Thompson House	3119 South Day Street	NRHP, WHR, SL	Project avoids resource.	No Impact
	I90	I-90 Lake Washington Highway Segment between mileposts 3.4 and 8.9	I-90 between mileposts 3.4 and 8.9 (includes Mount Baker Ridge Tunnel and Eastern Portals)	eNRHP, eWHR, SL[a]	Project is consistent with the character and design intent of I-90.	No Impact
	156	Endresen Residence	1402 32nd Avenue South	eSL	Project avoids resource.	No Impact
	133	Romaine Electric/Washington Iron Works Pattern Shop	1101 Airport Way South	eSL	Project avoids resource.	No Impact
B, South Bellevue	16	Frederick Winters House	2102 Bellevue Way SE	NRHP, WHR	All alternatives, except *Preferred Alternative B2M* avoid resource. *Preferred Alternative B2M* designed with minimization and mitigation measures during construction and in operations. Project would benefit the property with landscape improvements consistent with the historic period and interpretative signage.	Potential Impact for Alternative B2M only
	63	Pilgrim Lutheran Church	10420 SE 11th Street	eNRHP, eWHR	Project avoids resource; small area of parking lot is affected, away from resource.	No Impact
C, Downtown Bellevue	various	Potential Surrey Downs historic district	Between 108th Avenue and 112th Avenue SE, south of Main Street (see Table 7-4)	Potentially eNRHP, eWHR	*Preferred Alternative C11A*: resource is separated from project with landscaped buffer and noise barrier. Construction minimization measures in place.	Potential Impact

1.0 Introduction

The East Link light rail system would connect Seattle, Mercer Island, Bellevue, and Redmond, with a length of about 18 miles. This technical report, prepared to support the Sound Transit East Link Project's Final Environmental Impact Statement (EIS), addresses potential effects on historic and archaeological resources, which include the following: prehistoric and historic-period archaeological sites; districts, buildings, structures, objects, and landscapes; and cultural or traditional places or resources that have value to a community, such as an Indian tribe. Important resources are termed "historic properties" and—because of the inclusion of federal monies or federal licensing and permitting—must be considered by the lead agencies as they make decisions about the East Link Project. Section 1.1 provides a description of the East Link Project.

This technical report addresses historic and archaeological resource laws and regulations (Section 2.0) and the methods used for the investigations (Section 3.0). The Federal Transit Administration (FTA) and Sound Transit consulted with interested Indian tribes and the Washington State Historic Preservation Officer (SHPO) in the Department of Archaeology and Historic Preservation (DAHP), and the Washington State Department of Transportation (WSDOT) (as described in Section 4.0). The investigation included information on the natural setting (Section 5.0) and cultural context (Section 6.0) of the study area. The results of survey efforts to inventory historic and archaeological resources, and to identify historic properties, appear in Section 7.0. Potential project effects are discussed in Section 8.0, potential mitigation measures in Section 9.0, and cumulative effects in Section 10.0. Section 11.0 lists the references cited in this report. The appendices contain the following information: archaeological surveys (Appendix A and B), the inventory of historic buildings and structures (Appendix C), background reports on the Winters House (Appendix D), agency consultation (Appendix E), reports from previous cultural resource management studies (Appendix F), and the draft Memorandum of Agreement (Appendix G). Inventory forms for each building or structure have been submitted to DAHP.

Several cultural resource management specialists from Historical Research Associates, Inc. (HRA) contributed to this study, including senior reviewer Gail Thompson, Ph.D., principal investigator and Project Manager Erica Kachmarsky, M.A., who lead historical research, inventory, and evaluation of buildings and structures with Ann Gillespie, M.A., and Jennifer Gilpin, M.A., who directed the 2010 archaeological survey and analyzed archaeological information, including data compiled previously by Gretchen Kaehler, M.A. Lori Durio Price, M.A. of CH2M HILL was responsible for senior technical review, and also prepared the draft of the Section 106 Memorandum of Agreement for the Project.

1.1 Project Description

The proposed project consists of constructing and operating an approximately 18-mile light rail system that would connect Sound Transit's Central Link at the International/Chinatown Station to Redmond via Interstate 90 (I-90) to Mercer Island, Downtown Bellevue, and Bel-Red/Overlake before terminating in Downtown Redmond. Light rail consists of electrically powered trains of up to four cars running on steel rails operating at speeds of up to 55 miles per hour in a dedicated right-of-way.

1.2 Description of Alternatives

The following alternatives are evaluated in the Final EIS and described here for easy reference. The project is divided into five segments, A through E. The alternatives are made up of a range of light rail routes and stations. The proposed route and station alternatives vary in profile as travelling at-grade, elevated, or in a tunnel. There are four maintenance facility location alternatives, which are described further in the Final EIS.

1.2.1 Segment A: Interstate 90

Segment A has one alternative, the ***Preferred Interstate 90 Alternative (A1)***, which crosses Lake Washington and connects Seattle and Mercer Island with Segment B, South Bellevue. *Preferred Alternative A1* has two stations: one in Seattle and one on Mercer Island (Exhibit 1-1).

1.2.2 Segment B: South Bellevue

Segment B has six alternatives and one design option that connect to Downtown Bellevue in Segment C as shown in Exhibit 1-2.

Preferred 112th SE Modified Alternative (B2M) is elevated in the I-90 center roadway, crosses over westbound I-90, and continues elevated on the east side of Bellevue Way SE to the South Bellevue Station, located at the current South Bellevue Park-and-Ride; this alternative also maintains the westbound and eastbound I-90 high-occupancy vehicle (HOV) ramps. The South Bellevue Station includes a parking structure up to about five stories high built on the site of the existing South Bellevue Park-and-Ride. After leaving the station, the route transitions to a retained cut on the east side of Bellevue Way within Mercer Slough Nature Park to the intersection of Bellevue Way SE and 112th Avenue SE. From this point, *Preferred Alternative B2M* has three variations that connect to one of the Segment C *Preferred Alternatives*: one connects to *Preferred 108th NE At-Grade Alternative (C11A)*, and two connect to *Preferred 110th NE Tunnel Alternative (C9T)*. Each variation connects to one of the Segment C *Preferred Alternatives*. The following describes the three variations**:**

- When connecting to *Preferred Alternative C11A*, *Preferred Alternative B2M* continues in a retained cut on the east side of Bellevue Way SE and then travels under the northbound lanes of 112th Avenue SE to enter the center median of this road and travel in the median to SE 8th Street. This variation does not have a SE 8th Station.
- When connecting to *Preferred Alternative C9T*, *Preferred Alternative B2M* transitions to at-grade on the east side of 112th Avenue SE to the at-grade SE 8th Station north of SE 8th Street. From there *Preferred Alternative B2M* remains at-grade until reaching Segment C at SE 6th Street.

Bellevue Way Alternative (B1) travels within the I-90 center roadway and continues in the Bellevue Way SE HOV direct-access ramp under the westbound lanes of I-90 onto Bellevue Way at-grade to the South Bellevue Station. Alternative B1 travels in the median of Bellevue Way SE its entire length up to Segment C at SE 6th Street. Bellevue Way from north of the South Bellevue Station up to SE 6th Street would generally be widened to the west. North of the 112th Avenue NE intersection, the widening of Bellevue Way may fluctuate to either side in some locations.

112th SE At-Grade Alternative (B2A) is elevated in the I-90 center roadway, crosses over westbound I-90, and touches down on the east side of Bellevue Way in an elevated profile. After leaving the South Bellevue Station, the alternative transitions to at-grade in the median of Bellevue Way, turning into the median of 112th Avenue SE and extending to SE 6th Street. Additional right-of-way would be required along the east side of Bellevue Way SE, both north and south of the Frederick Winters House, as well as across from the Frederick Winters House on the west side of the road. Also, 112th Avenue SE would be widened to the east and west within existing right-of-way to maintain existing travel lanes.

112th SE Elevated Alternative (B2E) is the same as Alternative B2A up to the South Bellevue Station. After the station, Alternative B2E crosses to the west side of Bellevue Way SE until just south of the Bellevue Way SE/112th Ave SE intersection, where the alternative crosses over to continue along the east side of 112th Avenue NE to SE 6th Street. The SE 8th Station is elevated for Alternative B2E. Most of the additional right-of-way would be required along the west side of Bellevue Way SE north of the South Bellevue Station and on the east side of 112th Avenue SE just south and north of SE 8th Street.

112th SE Bypass Alternative (B3) follows the same route as Alternatives B2A and B2E to the South Bellevue Park-and-Ride. North of the park-and-ride lot, Alternative B3 mimics Alternative B2A in profile and right-of-way requirements, except that it becomes elevated along 112th Avenue SE, south of SE 8th Street, and then turns northeast in new right-of-way behind commercial buildings and up to SE 6th Street. It does not include a SE 8th Station.

Alternative B3 - 114th Extension Design Option (B3 - 114th Extension Design Option) extends the route at SE 8th Street farther east to 114th Avenue SE and turns north along the east side of 114th Avenue. The extension travels through the Wilburton Park-and-Ride and then cross 114th Avenue SE again to connect to Segment C.

BNSF Alternative (B7) is elevated in the I-90 center roadway similar to Alternatives B2, B2E, and B3, except that it crosses over westbound I-90 and the HOV off-ramp near Bellevue Way SE and moves to the north side of I-90 and continues eastbound elevated across Mercer Slough in a new 30-foot right-of-way until it turns north inside the former BNSF Railway right-of-way. After the 2008 Draft EIS was published, the I-405 South Bellevue Widening Project was completed, which included removing the Wilburton Tunnel over I-405 and widening I-405 to the west near the Alternative B7 route. This widening changed the topography near the route for approximately 500 feet, which changed the profile for this part of the route from at-grade to elevated. Neither the profile elevation nor the horizontal alignment of the route was changed. The I-405 South Bellevue Widening Project also constructed sound barriers between I-405 and some residences along 118th Avenue SE.

1.2.3 Segment C: Downtown Bellevue

Segment C has ten alternatives through Downtown Bellevue, crossing I-405 to connect with Segment D at NE 12th Street (Exhibit 1-3). Sound Transit identified the *Preferred Alternative C11A* as the new preferred at-grade alternative in Segment C and *Preferred Alternative C9T* as the new preferred tunnel alternative in Segment C. The new tunnel alternative was developed in response to requests from the City of Bellevue for a shorter and less expensive tunnel alternative.

Preferred 108th NE At-Grade Alternative (C11A) connects with *Preferred Alternative (B2M)* or Alternatives B3 and B7. When connecting with *Preferred Alternative B2M*, *Preferred Alternative C11A* transitions from center-running to side-running on the west side of 112th Avenue SE, crossing the southbound lanes south of SE 6th Street. It continues north from SE 6th Street, remaining at-grade along the west side of 112th Ave SE, transitioning from at-grade profile to retained fill on the west side of 112th Avenue SE and then becomes elevated to cross SE 1st Place and turn west. *Preferred Alternative C11A* then travels on the south side of Main Street in a retained cut to the 108th Station between 108th and 110th Avenues NE. From the 108th Station, *Preferred Alternative C11A* turns north at-grade over Main Street to the center of 108th Avenue NE. At NE 6th Street, C11A turns east along the center of NE 6th Street to the at-grade Bellevue Transit Center Station, located at the existing Bellevue Transit Center between 108th and 110th Avenues NE. *Preferred Alternative C11A* then crosses 110th Avenue NE at-grade, transitioning to a retained fill and then to an elevated profile between 110th and 112th Avenues NE before crossing 112th Avenue NE. Alternative C11A transitions from center-running on NE 6th Street between 110th and 112th Avenues NE to the north side of NE 6th Street before crossing I-405 and 116th Avenue NE. *Preferred Alternative C11A* then turns north along the former BNSF Railway right-of-way to cross NE 8th Street and reach the elevated Hospital Station and then connects with Segment D alternatives from the former BNSF Railway right-of-way. When connecting to Alternatives B3 and B7, Alternative C11A crosses elevated over 112th Avenue SE just south of Main Street to follow the south side of Main Street to the 108th Station before turning north under at grade on 108th Avenue NE.

Preferred 110th NE Tunnel Alternative (C9T) connects to *Preferred Alternative B2M* or Alternatives B3 and B7. When connecting to *Preferred Alternative B2M*, *Preferred Alternative C9T* begins on the east side of 112th Avenue SE at SE 6th Street and then transitions to the west side of 112th Avenue SE at SE 6th Street. This alternative then travels at-grade on the west side of the road before turning west at Main Street to enter the tunnel portal. The tunnel continues on the south side of Main Street before turning north under 110th Avenue NE. This alternative requires realigning SE 4th Street through Surrey Downs Park to connect to 112th Avenue SE further south, forming a 4-way intersection at SE 6th Street. The Bellevue Transit Center Station would be at NE 4th Street. From the station, *Preferred Alternative C9T* continues north to NE 6th Street, where it turns east and transitions to an elevated profile in the center of NE 6th Street to cross 112th Avenue NE, I-405, and 116th Avenue NE. *Preferred Tunnel Alternative C9T* then turns north along the former BNSF Railway right-of-way to cross NE 8th Street and reach the elevated Hospital Station, and then it connects with Segment D alternatives from the former BNSF Railway right-of-way. When connecting to Alternative B3 or B7, *Preferred Alternative C9T* crosses elevated over 112th Avenue SE to follow the south side of Main Street, transitioning to a tunnel before turning north under 110th Avenue NE.

The Bellevue Way Tunnel Alternative (C1T) continues at-grade in the median of Bellevue Way SE from Alternative B1, then transitions to a tunnel in a retained cut from approximately SE 4th Street to SE 2nd Street. Alternative C1T continues in a tunnel to the underground Old Bellevue Station between Main Street and NE 2nd Street. The alternative turns east at NE 6th Street to an underground station at the Bellevue Transit Center and exits the tunnel after 110th Avenue NE in an elevated profile in the median of 112th Avenue NE. It continues over I-405 and 116th Avenue NE before turning north inside the former BNSF Railway right-of-way. The Hospital Station is elevated just north of NE 8th Street. Alternative C1T then descends to an at-grade profile to cross under NE 12th Street where it connects to Segment D.

106th NE Tunnel Alternative (C2T) travels from Segment B in a tunnel under 106th Avenue NE, turns east at NE 6th Street, and crosses over I-405 to connect with the Segment D alternatives.

108th NE Tunnel Alternative (C3T) travels from Segment B in a tunnel under 108th Avenue NE, turns east at NE 12th Street, and crosses I-405 to connect with the Segment D alternatives.

Couplet Alternative (C4A) travels from Segment B at-grade with a northbound track on 110th Avenue NE and southbound track on 108th Avenue NE. It turns east at NE 12th Street and crosses I-405 to connect with the Segment D alternatives.

112th NE Elevated Alternative (C7E) travels from Segment B elevated along 112th Avenue NE, turns east on NE 12th Street, and crosses I-405 to connect with the Segment D alternatives.

110th NE Elevated Alternative (C8E) travels from Segment B adjacent to 114th Avenue NE/I-405, turns west at NE 2nd Street and north elevated along 110th Avenue NE, turns east at NE 12th Street, and crosses I-405 to connect with the Segment D alternatives.

110th Avenue NE At-Grade Alternative (C9A) follows a similar route as *Preferred Alternative C11A*, but along 110th Avenue NE instead of 108th Avenue NE. From Segment B, Alternative C9A could connect with Alternative B2A, B2E, B3, or B7 from the Draft EIS. This alternative has a SE 8th Station if connecting to Alternative B2A or B2E or has an East Main Station if connecting to Alternative B3 or B7. From the Segment B connection, Alternative C9A heads west on the south side of Main Street before turning north in the center of 110th Avenue NE and traveling in the center to NE 6th Street, where it would turn east to a Bellevue Transit Center Station located between 110th and 112th avenues NE. From the station, this alternative travels east in an elevated profile over 112th Avenue NE, I-405, and 116th Avenue NE. Alternative C9A then turns north along the former BNSF Railway right-of-way to cross NE 8th Street and reach the elevated Hospital Station and then connects with Segment D alternatives from the former BNSF Railway right-of-way.

114th Avenue NE Elevated Alternative (C14E) connects to Alternative B3 or B7 from the 2008 Draft EIS and follows 114th Avenue SE/NE to the south side of the I-405 and NE 8th Street interchange. This alternative is elevated the entire distance and crosses over I-405 beginning at NE 6th Street. The Bellevue Transit Center Station is located on an elevated structure above 114th Avenue NE, between NE 4th and 6th Streets, east of the existing Bellevue Transit Center. To provide better access from the Bellevue Transit Center, a moving sidewalk connects the station to City Hall Plaza, located across the street from the Bellevue Transit Center. After crossing I-405, Alternative C14E crosses 116th Avenue NE in an elevated profile and then turns north in the former BNSF Railway right-of-way to an elevated Hospital Station. This alternative does not include the East Main Station.

An **Interim Terminus** would be needed if the East Link Project were built in phases. A station in Segment C could be selected as the interim terminus station until completion of the final phase of the East Link Project. The Hospital or Ashwood/Hospital Station in Segment C could serve as an interim terminus, depending on the alternative selected. An interim terminus would require storage tracks up to 850 feet beyond the station platform for temporary layover of a four-car train and turnback operations.

The preferred interim terminus location is a storage track in the former BNSF Railway corridor north of the Hospital Station. However, operational plans may require the construction of a maintenance facility at the interim terminus. The closest of the proposed alternative maintenance facility sites is in Segment D, so an access track and maintenance facility may be built beyond Segment C under this phasing scenario.

1.2.4 Segment D: Downtown Bellevue to Overlake Transit Center

There are four alternatives in Segment D and one design option, which serve both the City of Bellevue's Bel-Red Corridor and Redmond's Overlake Village planning areas (Exhibit 1-4). The Segment D alternatives begin with connections from either the north side of NE 12th Street across 116th Avenue NE or from the former BNSF Railway right-of-way coming from NE 6th Street. Sound Transit prepared the design modifications to the *Preferred NE 16th At-Grade Alternative (D2A)* based on comments from property owners in the corridor, the cities of Bellevue and Redmond, and the Sound Transit Board.

Preferred NE 16th At-Grade Alternative (D2A) travels parallel to and north of a new NE 15th and 16th Street corridor east from 116th Avenue NE in a mixed at-grade, retained-cut, and elevated profile. This alternative has four stations: 120th, 130th, Overlake Village, and Overlake Transit Center. *Preferred Alternative D2A* crosses 116th

Avenue NE at-grade, continues elevated over the former BNSF Railway tracks, and then transitions to a retained cut under 120th Avenue NE to a retained-cut 120th Station. After leaving the station, the route continues in a retained cut under 124th Avenue NE before transitioning to an elevated profile over the Kelsey Creek West Tributary and returns to the at-grade 130th Station, which includes a park-and-ride lot. *Preferred Alternative D2A* continues at-grade on NE 16th Street, turns at 136th Place NE, and crosses NE 20th Street at-grade until it transitions to an elevated structure along the south side of SR 520. This alternative then continues northeast to the Overlake Village Station west of 152nd Avenue NE, next to SR 520, and transitions to a retained-cut profile after the station until reaching the retained-cut Overlake Transit Center Station, which includes a proposed four-story parking structure. King County Metro bus, Sound Transit bus, and Microsoft shuttle services are integrated into this station. From this station, the route descends into a retained-cut profile on the east side of SR 520 and crosses under NE 40th Street before connecting with all the Segment E alternatives. *Preferred Alternative D2A* also includes the preferred location for storage tracks to extend north of the Segment C and D connection within the former BNSF Railway corridor. An interim terminus would be needed if the East Link Project is built in phases. Any proposed station in Segment D could be selected as the interim terminus station until completion of the final phase of the East Link Project. An interim terminus would require storage tracks up to 850 feet beyond the station platform for temporary layover of a four car train and turnback operations. The *Preferred Alternative* includes proposed storage tracks in the former BNSF Railway corridor north of the Segment C/D break.

Preferred Alternative D2A also includes design options. One option follows the same horizontal alignment between 120th and 124th Avenues NE, but it is at-grade instead of a retained cut, with an at-grade 120th Station. The second design option is similar to the original *Preferred Alternative D2A* evaluated in the 2008 Draft EIS near NE 24th Street and 152nd Avenue NE, but it leaves the SR 520 corridor and runs elevated along the north side of NE 24th Street. After crossing 148th Avenue NE, *Preferred Alternative D2A* becomes at-grade before turning north along the west side of 152nd Avenue NE to the Overlake Village Station, and continues north to the SR 520 right-of-way.

NE 16th Elevated Alternative (D2E) is an elevated version of *Preferred Alternative D2A* except for the Overlake Village area. This alternative is elevated over 116th Ave NE then continues elevated along NE 16th corridor turning north and crossing over NE 20th Street and then following the south side of SR 520 continues over 148th Avenue NE staying on the south side of NE 24th Street before turning north along the east side of 152nd Avenue NE and continuing to SR 520 where it descends into a retained cut to Overlake Transit Center Station.

NE 20th Alternative (D3) follows the same route as *Preferred Alternative D2A* until the alternative approaches NE 20th Street, where it turns east into the median of NE 20th Street at-grade, requiring widening on either side of the road, then into a retained cut east of 140th Avenue NE. Alternative D3 remains in a retained-cut profile, heading north at 152nd Avenue NE, transitions to an at-grade center-running route just south of NE 24th Street. 152nd Avenue NE would be widened to the east and west. The alternative continues north to Overlake Village and then mirrors the *Preferred Alternative D2A* profile and stations, except that D3 is in the median of 152nd Avenue NE.

SR 520 Alternative (D5) is elevated from the north side of NE 12th Street, or at-grade in the former BNSF Railway, turns east at approximately NE 20th Street, crosses Northup Way, and continues east on the south side of SR 520. The alternative crosses over NE 24th Street and then transitions into a retained-cut profile under 148th Avenue NE and then into the retained cut/at-grade station at the Overlake Village Station behind the Safeway store or at the Overlake Village Station at NE 25th Street along the west side of 152nd Avenue NE. From 152nd Avenue NE, Alternative D5 is similar to *Preferred Alternative D2A* going to Segment E.

1.2.5 Segment E: Overlake Transit Center to Downtown Redmond

The three Segment E alternatives follow one route from Segment D along the south side of SR 520 until they split into three different routes accessing Downtown Redmond (Exhibit 1-5). From the Overlake Transit Center, all Segment E alternatives follow along the south side of SR 520 and under NE 40th Street, NE 51st Street, and NE 60th Street in a retained-cut profile. The three alternatives split into different routes at the SR 520 interchange with Lake Sammamish Parkway. The *Preferred Marymoor Alternative (E2)* crosses the interchange to continue east along the south side of SR 520.

Preferred Marymoor Alternative (E2) (see Exhibit 1-5) was modified in response to the City of Redmond by replacing the Redmond Town Center Station and the Redmond Transit Center Station with one Downtown

Redmond Station located midway between the two original stations and discontinuing the alignment up 161st Avenue NE. *Preferred Alternative E2* remains elevated on the south side of SR 520 in a new bridge structure over the Sammamish River, descending down to grade and straddling the SR 520 right-of-way and Marymoor Park property lines. The SE Redmond station, parking structure, and park-and-ride lot are located on the south side of the SR 520 and SR 202 interchange. After the station, *Preferred Alternative E2* turns west going under the SR 520 and SR 202 interchange and enters the former BNSF Railway right–of-way elevated over SR 520 and Bear Creek. *Preferred Alternative E2* then becomes at-grade to cross 170th Avenue NE and continues in the former BNSF Railway corridor to the Downtown Redmond Station and terminus northwest of Leary Way. An 800-foot-long tail track would extend past the station for train layovers. *Preferred Alternative E2* has two traction power substations: one located adjacent to the route before approaching West Lake Sammamish Parkway and another just east of 166th Avenue NE prior to the Downtown Redmond Station. The E2 – Redmond Transit Center Design Option retains the Redmond Town Center Station and the Redmond Transit Center Station and continues up 161st Avenue NE as described in the 2008 Draft EIS.

Redmond Way Alternative (E1) becomes elevated and crosses north over SR 520, follows the northwest side of West Lake Sammamish Parkway, and turns northeast on the south side of Redmond Way on a new bridge structure over the Sammamish River. Alternative E1 continues along Redmond Way and turns southeast into an at-grade profile onto the former BNSF Railway right-of-way to Redmond Town Center, then transitions to an elevated structure over Bear Creek and the SR 520/SR 202 interchange to the terminus, SE Redmond Station. This station would include a four-story structured park-and-ride facility in the industrial park adjacent to the former BNSF Railway corridor.

Leary Way Alternative (E4) crosses north over SR 520 and is elevated on the northwest side of West Lake Sammamish Parkway, and it turns northeast along the south side of Leary Way, crossing the Sammamish River on a new bridge structure, then transitions to an at-grade profile south of Bear Creek Parkway and turns southeast in the former BNSF Railway right-of-way. The alternative continues along the former BNSF Railway, crosses over Bear Creek on a bridge, and then transitions into a retained-cut profile under SR 520 before terminating in an at-grade profile. The SE Redmond terminus station would include a four-story structured park-and-ride facility in the industrial park adjacent to the former BNSF Railway corridor.

2.0 Laws and Regulations

2.1 Federal Laws and Regulations

Federal laws and regulations apply because FTA is the lead agency for Sound Transit's East Link Project. WSDOT is a cooperating agency, and the Washington SHPO is a consulting party. The National Historic Preservation Act of 1966 (NHPA), as amended, and the National Environmental Policy Act of 1969 (NEPA) provide for the consideration of historic properties; the FTA's guidance follows federal regulations for these laws. NHPA Section 106 states that any federal or federally assisted project or any project requiring federal licensing or permitting must consider the project's effects on historic properties listed in, or eligible for listing in, the National Register of Historic Places (NRHP or National Register). Regulations governing the Section 106 review process are contained in the Code of Federal Regulations (CFR) Title 36, Part 800, Protection of Historic Properties. Properties include historic and prehistoric archaeological sites, as well as districts, buildings, structures, objects, and landscapes. The NHPA also provides for consultation with American Indian groups when proposed projects might affect cultural or traditional places or resources that have value to an Indian tribal group, derived from the role the property plays in the community's historically rooted beliefs, customs, and practices (NHPA Section 101). These regulations encourage coordination with the environmental review process required by other statutes, including Section 4(f) of the U.S. Department of Transportation Act of 1966.

Regulations in 36 CFR 800 provide a step-by-step process for satisfying the Section 106 requirements. There are four steps: 1) initiate consultation with regulatory agencies, concerned Indian tribes, and other interested parties; 2) identify historic properties; 3) assess adverse effects; and 4) resolve adverse effects. Significant properties are evaluated in consultation with the Washington SHPO in the DAHP and must qualify for listing in the NRHP by being at least 50 years old, in most cases, and by meeting specific eligibility criteria and standards of integrity (36 CFR 60.4). The current investigation is designed to identify prehistoric and historic-period archaeological sites, historic buildings and structures, districts, and traditional cultural properties (TCPs), and to evaluate their National Register eligibility, to the extent feasible, using reconnaissance-level data. To consider the potential concerns of Indian tribes, the investigation also uses the following regulations:

- American Indian Religious Freedom Act of 1978
- Executive Order (EO) 13007 (access to and/or ceremonial use of sacred sites by Indian religious practitioners)

2.2 Washington State Laws

The State Environmental Policy Act (SEPA), Revised Code of Washington (RCW) 43.21C, and implementing rules contained in the Washington Administrative Code (WAC) 197-11 require the identification of historic, archaeological, and cultural resources listed in, or proposed for, national, state, and local registers, and the identification of measures to reduce or control effects on these resources. RCW 27.44, Indian Graves and Records, protects Indian burials, while RCW 27.53, Archaeological Sites and Resources, protects archaeological sites. RCW 42.56, Public Records Act, provides for the confidentiality of information on archaeological sites. WSDOT's *Environmental Procedures Manual* (WSDOT, 2006) Section 456, Historic, Cultural, and Archaeological Resources, and DAHP's survey and inventory standards both address the methods for cultural resource studies.

2.3 Municipal Regulations

The City of Seattle adopted additional specific environmental policies and procedures in the Seattle Municipal Code (SMC 25.05) while implementing SEPA. Procedures related to historic properties and archaeological sites need to comply with the Landmarks Preservation Ordinance (SMC 25.12), and resources that meet criteria for landmark designation must be identified. Properties eligible for city landmark designation must be at least 25 years old and meet at least one of six criteria of significance. The Seattle Landmarks Preservation Board conducts formal reviews to designate city landmarks. Altering landmarks requires a certificate of approval from the Landmarks Commission or another applicable commission, such as the Pioneer Square Preservation Board.

The City's historic preservation officer might require specific mitigation measures when a proposed project is located adjacent to or across the street from a designated landmark or when a site of potential archaeological significance is impacted.

The City of Mercer Island's Ordinance No. 05C-09 (amending Ordinance No. 02-16) contains provisions for historic designation of private and municipal properties, 50 years of age or older, within the city limits. The City of Redmond's Ordinance No. 2224 contains provisions for historic preservation, including a Redmond Heritage Resource Register, administered by the Landmarks and Heritage Commission. Designation requires that a structure be at least 40 years of age and meet other criteria established by the commission; archaeological sites also are eligible for designation. The property owner must apply to the commission to modify or demolish listed landmarks.

The City of Bellevue has no preservation ordinance. King County's Ordinance No. 20.62 requires the County to maintain a list of landmarks within the unincorporated areas and for some municipalities with which the County has formulated agreements. The County has no agreement with the City of Bellevue.

3.0 Methods

This chapter outlines the methodology developed for archaeological and historic evaluation and FTA and Sound Transit's consultation regarding the methodology. Project cultural resource specialists prepared a statement about the methods that would be used to inventory and evaluate historic properties, and to determine potential project effects and mitigation measures. Sound Transit provided the methods statement to DAHP and the Duwamish, Muckleshoot, Snoqualmie, and Tulalip Indian tribes for review, and discussed the methods during consultation meetings and field trips. The methodology includes the definition of the Area of Potential Effects (APE), data collection methods, archaeological sensitivity model and survey procedure, building and structure inventory methods, National Register of Historic Places eligibility evaluation process, effects analysis approach, and avoidance and mitigation measure development.

3.1 Area of Potential Effects

Sound Transit and FTA, consulted with, and received concurrence from, the SHPO on the APE used for the project (letter of July 13, 2007, from DAHP to FTA). Sound Transit determined and mapped an APE for both archaeological resources and historical buildings and structures (Appendix C). The APE is the area within which an undertaking may cause direct or indirect changes to the character of any historic properties. The APE for archaeological resources is limited to the portion of the project where ground-disturbing activities will be conducted, such as areas for demolition, construction, staging, equipment storage locations, and stormwater management facilities, per 36 CFR 800.16[d]. For the archaeological resource investigation, the vertical APE might vary according to construction practice—deeper for excavation areas and shallower for at-grade construction, depending on the geomorphology of the landform where the project element occurs.

The APE for historical buildings and structures is one block (approximately 200 feet) on each side of the centerline of the project routes (i.e., a total corridor width of approximately 400 feet). The APE extends approximately 200 feet from the outer limits of station locations and maintenance facilities. The APE also includes the area one block from where tunnel alternatives could disturb the surface or have the potential for other surface effects, depending on terrain and local land use. Uniquely, for bored or mined tunnel construction, the APE for noise, vibration, and settlement effects is 100 feet on each side of the route centerline (i.e., a total corridor width of approximately 200 feet).

3.2 Data Collection

Information regarding resources in the East Link Project APE, that have already been identified, evaluated, and recognized, was gathered from established lists—the NRHP, the Washington Heritage Register (WHR), the DAHP, and local landmark or historic designations. Online register lists for the King County Historic Preservation Program and the City of Seattle were checked. Project archaeologists and historians reviewed the methods and results of cultural resource management reports for previous surveys conducted near the APE. Information regarding existing historic or prehistoric archaeological and traditional cultural resources in the project APE was gathered to help characterize the types of resources that might be found, and to identify areas that possess a high sensitivity for containing such sites. Sources of this information included historical maps, ethnographic literature, local histories, General Land Office Survey maps, and the files and site records of the Washington DAHP. Project archaeologists and historians mapped the locations of known archaeological sites, ethnohistoric places, and historical buildings and structures.

Other sources included fire insurance maps, historical photographs, building permits, assessors' records, and oral histories. Locations for this information included the University of Washington, Seattle Public Library, the Museum of History and Industry, and the Washington State Archives Puget Sound Region Branch at Bellevue Community College. In addition, Project historians contacted the Eastside Heritage Center, advocates for historic preservation, and private-sector experts.

Research was conducted to determine the soil types, geomorphologic setting, and age of landforms involved, as well as the extent of modern disturbance. The research established the potential for encountering buried prehistoric and historic archaeological sites, increasing the likelihood that existing sites would be identified during reconnaissance. It is possible, however, that one or more subsurface sites might not be discovered before construction.

Tribal consultation was the most important method for gathering data pertinent to identifying TCPs within the APE. Another method consisted of research into ethnographic sources that discuss Indian place names, especially the geographical data that T.T. Waterman prepared for the Puget Sound area in the 1920s (Hilbert, et al., 2001; Waterman, 1920). During consultation, Sound Transit, FTA, and tribal representatives discussed protocols to protect culturally sensitive information from broad public distribution. If TCPs were to exist within the APE, and interested tribes were concerned about maintaining the confidentiality of culturally sensitive information, then Sound Transit and FTA would avoid placing information specifically identifying the resource in the EIS.

3.3 Archaeological Study

3.3.1 Archaeological Sensitivity Models

Project archaeologists mapped the potential for prehistoric and historic-period archaeological sites to occur in the APE and reviewed information gathered about environmental features, known archaeological resources, and the patterns of prehistoric, ethnographic, and historic use of the area. Project archaeologists then studied maps and conducted a vehicle reconnaissance of the alternatives in 2007. Project archaeologists developed a set of criteria for identifying areas with a high sensitivity for containing archaeological sites, excluding locations with apparently severe disturbance, such as along I-90 in Segment A. High-sensitivity zones were identified areas where the potential for archaeological resource findings is high. The high-sensitivity areas are as follows:

- Areas within about 0.25 mile of water body confluences, especially water bodies with anadromous fish runs
- Areas within about 0.25 mile of water bodies
- Areas within about 0.25 mile of freshwater resources
- Areas on higher ground, such as terraces above water bodies
- High areas that provide protection and/or visibility, such as bluff tops

Areas on General Land Office (GLO) plats and/or Sanborn Fire Insurance Maps that show historical land use. In response to the DAHP comment on the Draft EIS requesting additional archaeological survey, project archaeologists developed an expanded cultural resources survey plan to identify potential prehistoric and historical archaeological sites along the *Preferred Alternative* and guide additional surveys as part of Final EIS (Gilpin and Thompson, 2010). Project archaeologists used information gathered about known archaeological resources and the patterns of prehistoric, ethnographic, and historic use of the area, along with the results of the previous cultural resources assessment, which was conducted in advance of the Draft EIS (Thompson et al. 2007). Archaeological field survey was designed to target a reasonably representative sample of the Project's *Preferred Alternative* with a systematic examination of a number of parcels, concentrating on high probability areas, but also including some lower probability areas; some open and undeveloped areas; more developed, urbanized areas; and some public and private ownership areas, within the APE of the *Preferred Alternative*.

Project archaeologists first identified areas of greater or lesser archaeological probability by reference to models developed by HRA for the East Link Project, and by DAHP for the state. The archaeological sensitivity data from the DAHP was provided in a format compatible with Global Positioning System (GPS) mapping software (e.g., ESRI ArcMap®), and the information covered the alignments active at that time. The DAHP archaeological predictive model uses standardized and repeatable statistical methods including Bayesian statistical analysis and "point kringing" (a form of geostatistical spatial estimation) (Kauhi and Markert 2009:46) with statewide environmental and cultural resources data. Data on geology, soils, landform, and information gleaned from historic-period GLO plats, were correlated with locations of known archaeological sites to "…determine the probability that, under a particular set of environmental conditions, another location would be expected to contain an archaeological site." (Kauhi and Markert, 2009)

DAHP's model combines local information from field surveys to identify locations with five resulting sensitivity levels: Very High (5), High (4), Moderate (3), Low (2), and Very Low (1). The agency refined these categories for management purposes, with groups (1) and (2), Archaeological Survey Contingent upon Project Parameters; group (3), Archaeological Survey Recommended; and groups (4) and (5), Archaeological Survey Required. The sensitivity zones developed by project archaeologists and the DAHP are shown on maps provided in Appendix B, and they are discussed in Section 7.1.2.

3.3.2 Selection of Geotechnical Boring Locations for Archaeological Survey

As part of preliminary engineering for the project, geotechnical borings were conducted in Segments A through D to assess general subsurface soil and groundwater conditions. The borings measured up to 8 inches in diameter and extended from approximately 50 to 200 feet deep. Project archaeologists determined that these borings would provide relatively little useful archaeological data because of the methods that are used in drilling. As a result, FTA proposed, and DAHP concurred, that no archaeological monitoring would be conducted during this exploratory work. A more important concern was whether the drilling activity (e.g., moving or storing equipment) could impact an unrecorded archaeological site. This would most likely occur on a soft surface, such as grass, that has not previously received an archaeological survey. For this reason, a "pre-excavation archaeological survey" was proposed for four high sensitivity boring locations (Thompson and Gilpin, 2010).

Several sources of information were examined to identify highly sensitive boring locations. Project archaeologists first examined archaeological sensitivity maps of the project APE (see Section 3.3.1, above), and compared these data with GIS maps showing the locations of proposed bore holes plotted on an aerial photograph background. Project archaeologists then used a table that outlined the identification (i.e., designation), location, and several additional characteristics of each proposed boring. These characteristics included proposed depth overall, depth to a hard (i.e., glacial, bedrock) surface, whether the bore would be placed on pavement or grass, and the potential for disruption of traffic.

Project archaeologists used the sensitivity maps and table, in combination with the results of the 2007 archaeological survey for the project, to winnow the list of potentially sensitive probe locations to those proposed for a pre-drilling survey. As a final cross-check, to potentially further refine boring locations, archaeologists examined the data for eight geotechnical borings excavated for the 2008 Draft EIS (Jacobs Associates, 2007) and 18 previously excavated borings along the route in Segment B (GeoMap NW 2009).The eight borings described by Jacobs Associates (2007) in Appendix B are located along Segment C, and were largely outside the area of the boreholes planned for Final EIS studies in the highly sensitive portions of Segment B. However, the 18 bores mentioned previously were drilled in the direct vicinity of the Segment B route.

The high-sensitivity borehole locations selected for archaeological survey occur along Segments B, C, and D. Segment A was not included because it consists largely of I-90, which either contains too much fill or is too disturbed for archaeological resources to be present, and no borings are presently planned for Segment E. Following are the selected borehole locations:

- Located in the previously-mapped zones of higher archaeological sensitivity
- Proposed to be excavated on a grassy surface (This narrowed down the probe locations to several in Segment B, with none in Segments C or D, where borings in archaeologically sensitive areas are proposed to be drilled on pavement.)
- Situated on relatively little estimated fill (This step eliminated several probes that are located close to the I-90 on- and off-ramps to Bellevue Way SE.)
- Proposed to be drilled outside of the boundaries of the 2007 archaeological survey tracts in Segment B, for which archaeological and subsurface information is already known (Thompson and Gilpin, 2010)

3.3.3 Archaeological Survey

For the initial archaeological survey conducted in 2007, Project archaeologists focused attention on multiple routes. Archaeologists selected a number of tracts for survey, favoring locations with high sensitivity for containing archaeological sites, but also including some areas of low sensitivity for comparison. Survey tracts focused on land that is publicly owned and on open land used to facilitate access, land with clear views of the ground surface, and on land allowing the possibility of digging shovel test probes. These locations were dispersed among the alternatives, as practical (Appendix B).

For the 2010 Archaeological Survey Plan (Appendix A), a similar method for selecting survey tracts was used, although attention was focused on the *Preferred Alternative* in each project segment. Project archaeologists prepared an Archaeological Survey Plan, and much of the discussion below is taken from this document (Thompson and Gilpin, 2010). Project archaeologists created a color-coded priority system to aid in the selection of archaeological survey tracts (Thompson and Gilpin, 2010). The process of prioritizing was undertaken with reference to the two sensitivity models (see Section 3.3.1), and by taking into account perceived local ground disturbance. Table 3-1 outlines this color-based priority system, with the general guidelines applied by project archaeologists, while coding each proposed survey segment. Based on this method, 11 tracts were identified for Stage 1 survey (see Thompson and Gilpin 2010 for spreadsheets showing this process). Additional tracts were also identified using this method, for future survey.

TABLE 3-1
Colors Used To Categorize Proposed Final EIS Archaeological Survey Tracts

Flag Color	**Project Archaeologist Sensitivity (Approximate)**	**DAHP Sensitivity (Approximate)**	**Additional Factors**
Red	High	5 (Survey Highly Advised: Very High Risk) Can be 4 (Survey Highly Advised: High Risk)	Generally, fewer disturbances seen (i.e., vegetated), but largely very high sensitivity.
Yellow	High	5 (Survey Highly Advised: Very High Risk) 4 (Survey Highly Advised: High Risk) Can be 3 (Survey Recommended: Moderate Risk)	Generally showing more developed and/or paved surfaces, but still high sensitivity.
Green	Low	4 (Survey Highly Advised: High Risk) 3 (Survey Recommended: Moderate Risk) Can be 2 (Survey Contingent Upon Project Parameters: Moderately Low Risk)	Generally, fairly developed and/or paved surfaces; some moderate risk. These tracts can be used as control or comparison areas for lower probability.
Blue	Low	2 (Survey Contingent Upon Project Parameters: Moderately Low Risk) 1 (Survey Contingent Upon Project Parameters: Low Risk)	Generally, very developed and/or disturbed, with lowest archaeological sensitivity.

Project archaeologists coded the proposed tract as Red when both sensitivity models classified the area as High to Very High risk, and it appeared (using aerial photographs) that the vicinity showed few obvious disturbances (i.e., much of the area shows vegetation rather than development). Yellow survey tracts are those with generally high sensitivity, but usually with increased disturbance; for instance, development or paved surfaces. Project archaeologists coded tracts as Green when (a) archaeological probability was high to moderate (generally, by the DAHP model) and predicted disturbances were quite extensive, or (b) archaeological probability was more moderate, but fewer disturbances were evident on aerial photographs of the alignment. Blue survey tracts are those in low-probability areas for archaeological resources, and they are generally also perceived to be at least moderately affected by development. This color coding system was then used as a basis for assigning proposed survey tracts to Stage 1 and 2, as described below.

Based on this color-coded priority system, 11 tracks were identified for Stage 1 survey as part of the Final EIS because these meet the following criteria:

- Identified as high probability for archaeological resources under both sensitivity models
- Primarily in public ownership
- Free from pavement or otherwise readily accessible

Based on the information gained from Stage 1 research and archaeological investigations, including geotechnical borings, a second preconstruction survey (Stage 2) would be planned, refined, and implemented. Stage 2 tracts are anticipated to be outside of public ownership, or are paved or otherwise less accessible at the time of the 2010 survey. Portions of several proposed Stage 1 tracts extended onto private property (for example, in Segment B), and these portions may be surveyed in Stage 2 (Thompson and Gilpin, 2010). The Stage 2 approach is included in Appendix A, Archeological Survey Plan.

A crew of four archaeologists conducted the survey, walking pedestrian transects at intervals appropriate for each alternative and level of existing urban development, generally at about 10- to 20-meter (33- to 66-feet) intervals. While the 2007 survey was generally limited to surface investigation, except for alluvial sediments or relatively shallow historical fill, the 2010 survey focused on systematic subsurface survey of the *Preferred Alternative* in the Stage 1 survey tracts. The field director took into account local disturbances, topography, and field conditions (i.e., large amounts of fill or other recent disturbances, standing water) to determine the placement of auger or shovel probes. Probes were generally spaced at about 20-meter (66 foot) intervals, and they were excavated down to sterile materials or a maximum of 2 meters (7 feet) in depth.

Excavated matrix was screened through .025 -inch mesh and examined for prehistoric- and historic-period artifacts. Cultural items were documented on standardized shovel probe forms and, if diagnostic, by digital photography, before being returned to the excavated hole; no artifacts were collected. The shovel probes were immediately backfilled following their termination and recording, and the turf was replaced, as appropriate.

Included in the above-described group of strategic shovel probes is one location where Sound Transit planned to drill a geotechnical boring in an archaeologically sensitive zone (Survey Tract 12F). Prior to the excavation of this boring, archaeologists examined the grassy (or otherwise unpaved) ground surface surrounding the drill location, and excavated one shovel probe at the approximate drill location, to determine if the drilling (including the movement of drill-related machinery) would disturb an unrecorded archaeological site. Archaeologists also performed a pedestrian survey and excavated eight shovel probes within a length of the APE at the location of the proposed boring (see Appendix B). The location of survey transects and shovel probes was recorded using a handheld Trimble® GPS unit loaded with ArcGIS® software. Archaeological sites were mapped, photographed, and recorded using Washington Archaeological Site Inventory forms. Maps of archaeological survey tracts from 2007 and 2010, along with summary information on shovel probes, are provided in Appendix B and discussed in Section 7.1.3.

3.4 Inventory of Buildings and Structures

Sound Transit architectural historians conducted a literature and records search and a reconnaissance-level field survey of historic buildings and structures in the East Link APE using the year 2016 as a baseline. Per the baseline, buildings in the APE that would be 50 years old by 2016 were evaluated and documented. For buildings in the City of Seattle, Project architectural historians used the local age criterion of 25 years, whereas the City of Mercer Island uses an age of 50 years and the City of Redmond uses 40 years. As the City of Bellevue has no local historic preservation ordinance, the age criterion of 50 years old by 2016 was applied.

The architectural historians drove along the alternative routes on several occasions, between September 2006 and April 2010. Using lists compiled from records searches, including maps of parcels with buildings identified in King County Tax Assessor's data that met the age criteria, existing historic property inventory (HPI) forms, NRHP nomination forms, and published sources, the architectural historians compiled a master list of historic resources within the East Link APE. The architectural historians briefly surveyed these areas, in September and December 2006, to search for buildings and structures that would clearly be of concern in initial evaluations of project alternatives. These architectural historians returned to the study area in February, April, May, September through October 2007, and again in February, March, and April 2010, for systematic inventory along the alternatives.

Resources that met the applicable jurisdiction's age criterion by 2016 were photographed and reconnaissance-level data was entered into Washington State DAHP Historic Property database inventory forms along with a recommendation of the buildings' eligibility for listing in the NRHP, WHR, or local jurisdiction register. Complete inventory forms were then completed for those structures that met one or more of the eligibility criteria for the NRHP, WHR, or local jurisdictions' criteria of integrity and significance. The result of the records search and reconnaissance field survey is a list of existing and newly recommended historic properties in the APE that could be affected by one or more of the Project alternatives. A list of inventoried buildings and structures is provided in Appendix C and discussed in Section 7.3.

3.5 Evaluation of Register Eligibility

Prehistoric and historic-period archaeological sites, TCPs, and buildings and structures are called "historic properties" if they are listed in, or eligible for, the NRHP. To be eligible, a property must be at least 50 years old or be exceptionally important and meet one or more of the criteria for evaluation, as outlined in 36 CFR 60.4:

> *The quality of significance in American history, architecture, archeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, or association; and*
>
> A. *That are associated with events that have made a significant contribution to the broad patterns of our history; or*
>
> B. *That are associated with the lives of persons significant in our past; or*
>
> C. *That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or*
>
> D. *That have yielded or may be likely to yield, information important in prehistory or history.*

Certain properties are unlikely to qualify, including cemeteries, birthplaces and graves of historical figures, properties owned by religious institutions or used for religious purposes, structures that have been moved from their original locations, reconstructed historic buildings, properties primarily commemorative in nature, and properties that have achieved significance within the past 50 years. The application of the criteria considerations is discussed in 36 CFR Part 63. Properties can be eligible for the NRHP at the national, regional, or local level. Landmark registers for the cities of Seattle, Mercer Island, and Redmond use criteria similar to those for the NRHP, although the age criterion for the City of Seattle is 25 years and for the City of Redmond it is 40 years.

Sound Transit and FTA submitted the database of inventory forms to DAHP for review of preliminary determinations about NRHP eligibility. Similarly, the agencies submitted the forms to the cities of Seattle, Mercer Island, and Redmond for reviews of eligibility determinations. Only these local jurisdictions can determine local landmark status after their formal review; therefore, apparent eligibility for local landmark status was based solely on the professional judgment of East Link and local jurisdiction staff, and is not to be considered an official determination. DAHP reviewed the inventory forms and made concurrence determinations of National Register eligibility for the properties (Letters from DAHP to FTA of November 16, 2007; February 20, 2008; and February 24, 2009). The City of Redmond provided a letter regarding the National Register eligibility of properties within the City's jurisdiction (Letter from City of Redmond to Sound Transit of November 19, 2007), and the City of Mercer Island concurred with the project inventory and lack of National Register-eligible properties within its jurisdiction (Letter from Mercer Island to Sound Transit on January 22, 2008). The result was a list of existing and newly recommended historic properties in the APE that could be affected by one or more of the project alternatives.

3.6 Approach to Effects Analysis

The analysis for construction impacts and operations impacts follows the standard approach for historic properties, including buildings and structures, prehistoric and historic-period archaeological sites, and TCPs. The Advisory Council on Historic Preservation's regulations implementing NHPA Section 106 create a process by which federally assisted undertakings are reviewed for their impacts on properties listed in, or eligible for listing in, the NRHP. After the resource is identified and evaluated, the next step is to apply the Criteria of Adverse Effect. These criteria are used to determine whether the undertaking could change the characteristics that qualify the property for NRHP inclusion. An adverse effect (or impact) is found when an undertaking may alter, directly or indirectly, any of the characteristics of a historic property that qualify the property for inclusion in the National Register in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association. Adverse effects include, but are not limited to, the following:

- Demolishing or altering the property
- Altering the property's setting

- Introducing visual, audible, or atmospheric elements that are out of character with the setting of the historic property
- Physically encroaching upon an archaeological site

In addition to the criteria above, 36 CFR 800.5(b) allows the agency official to propose a finding of no adverse effect if the undertaking is modified or conditions are imposed to avoid impacts.

Cumulative effects are discussed using readily available information on past, present, and foreseeable projects.

3.7 Potential Mitigation Measures

When an undertaking is found to have an adverse effect, Section 106 requires consultation with the Washington SHPO in the DAHP, affected Indian tribes, and other interested parties regarding appropriate avoidance or mitigation measures. Some typical mitigation measures include modifying the undertaking through redesign, reorientation, or other similar changes; documenting buildings or structures that must be destroyed or substantially altered; and implementing data recovery of archaeological or architectural information and materials. Sound Transit and FTA consulted with SHPO about potential mitigation measures for historic properties. The product of consultation, when there is a finding of adverse effect for the project, is an agreement document (Memorandum of Agreement [MOA] per 36 CFR 800.6[c]) that contains stipulations specifying measures to be implemented that would avoid or mitigate the impacts. A draft MOA is in Appendix G of this report.

4.0 Agency and Tribal Consultation

Sound Transit consulted with the Washington DAHP, local jurisdictions, and Indian tribes during its historic and archaeological resources investigations. Sound Transit coordinated with staff members at the cities of Bellevue, Mercer Island, Redmond, and Seattle. Consultation with DAHP and other agencies clarified the applicable federal, state, and local legal and regulatory requirements for any archaeological sites and/or TCPs identified within the East Link APE.

Sound Transit and FTA sought government-to-government consultation with the Muckleshoot Indian Tribe, Snoqualmie Indian Tribe, Suquamish Tribe, Duwamish Tribe, Tulalip Tribes of Washington, and Yakama Nation, initially providing information by mail. The initial letters served to identify which tribes wished to participate in consultation, to establish a protocol, and to identify the appropriate tribal representatives with whom to consult. Meetings were held with Snoqualmie and Muckleshoot tribal representatives to discuss the project, its potential effects on archaeological sites and TCPs, and whether the tribes would like to make field trips to the study area and provide members for the archaeological field crew. Sound Transit and FTA solicited information from the tribes about the presence of any known archaeological sites and TCPs that might be affected by future construction of a *Preferred Alternative*. Table 4-1 lists the letters that resulted from agency and tribal consultation. Copies of letters appear in Appendix E.

TABLE 4-1
Consultation Summary

Date	Form	Participants	General Topic(s)
August 24, 2006	Letter	FTA/Sound Transit to Tulalip, Duwamish, Muckleshoot, Yakama, Snoqualmie, and Suquamish tribes	Opening consultation with tribes
December 19, 2006	Submittal of cultural resources methods statement to DAHP and ACHP, tribes and US Bureau of Indian Affairs for review	Sound Transit and DAHP	Historic, archaeological, and cultural resources methods statement sent to DAHP for review
January 2, 2007	Letter	From Matthew Sterner, DAHP, to James Irish, Sound Transit	Review comments on proposed resource study methods statement
July 3, 2007	Letter	FTA to DAHP	Requesting concurrence on APE for historic properties
July 13, 2007	Letter	DAHP to FTA	Concurring in APE for historic properties
July 18, 2007	Letter	FTA to DAHP	Requesting concurrence in determinations of NRHP-eligibility for historical resources
November 16, 2007	Letter	DAHP to FTA	Providing determinations of National Register eligibility for historic properties
November 19, 2007	Letter	City of Redmond to Sound Transit	Concurring with Local Register eligibility recommendations
November 19, 2007	Letter	Snoqualmie Tribe to Sound Transit	Requesting Sound Transit to clarify position about former BNSF Railway corridor.
January 9, 2008	Letter	FTA to DAHP	Requesting review and concurrence of additional historic properties
January 22, 2008	Letter	City of Mercer Island to Sound Transit	Concurring with Local Register eligibility recommendations
February 20, 2008	Letter	DAHP to FTA	Providing determinations of NRHP eligibility for additional historic properties
May 27, 2008	Letter	City of Seattle to Sound Transit	Providing determinations of eligibility for Seattle Landmark Ordinance

TABLE 4-1 CONTINUED
Consultation Summary

Date	Form	Participants	General Topic(s)
December 10, 2008	Letter	Advisory Council on Historic Preservation to Sound Transit	Acknowledging receipt of the 2008 Draft EIS
January 5, 2009	Letter	DAHP to FTA	Acknowledging receipt of 2008 Draft EIS and requesting consultation once a Preferred Alternative is selected
February 24, 2009	Letter	DAHP to FTA	Concurring with eligibility determinations for 337 properties and providing comments and potential determinations of effects
September 29, 2009	Letter	DAHP to FTA	Concurring with use of archaeological monitor in areas considered potentially sensitive.
November 23, 2009	Letter	DAHP to WSDOT	Concurring with eligibility determination for I-90 Lake Washington Segment
June 9, 2010	Letter	FTA to DAHP	Providing determinations of NRHP eligibility for additional historic properties
October 18, 2010	Letter	DAHP to FTA	Providing determinations of eligibility for additional historic properties
November 23, 2010	Letter	DAHP to FTA	Providing determination of eligibility for an archaeological site
March 28, 2011	Letter	FTA to DAHP	Requesting concurrence in determinations of NRHP-eligibility for a historical resource
May 19, 2011	Email	King County Metro Transit to FTA and Sound Transit	Providing Comments on the Archeological Resources Technical Report
May 23, 2011	Letter	City of Bellevue to FTA	Providing comments on potential historic impacts as a consulting party under Section 106
June 9, 2011	Letter	WSDOT to FTA	Concurring with determinations of Adverse Effect on Section 106 resources
June 10, 2011	Letter	City of Redmond to FTA	Review comments on the Historic and Archeological Resources Technical Report
April 21, 2011	Letter	FTA to DAHP	Requesting concurrence regarding determinations of NRHP-eligibility for archaeological resources.
June 15, 2011	Letter	DAHP to FTA	Providing concurrence determinations of National Register eligibility for historic properties and determinations of effect.

5.0 Environmental Context

This section describes the natural and geologic setting of the project vicinity, which provides a context for the environment in prehistoric times and insight regarding where archaeological remains may be discovered based on past geologic events and modern development.

5.1 Natural Setting

The East Link Project would be located in the central portion of the Puget Sound Lowland, generally running east and northeast across a series of north-south trending uplands and water bodies, from Seattle, east across Lake Washington and Mercer Island, along Mercer Slough, across the Bellevue upland, and into the Sammamish River Valley to Redmond. Drainages that would be crossed include Puget Sound, the Duwamish River estuary, Lake Washington, Mercer Slough, Sturtevant Creek, Lake Bellevue, Kelsey Creek and its tributaries, the Sammamish River, and Bear Creek. Ground surface elevations generally range within 500 feet above sea level. Summary information on environmental factors that would affect the resource and land use of prehistoric and historic-period residents can help identify areas sensitive for archaeological resources, as well as the types of resources that could be present.

Late Pleistocene glaciation and post-glacial alluvial processes shaped the landforms in the project vicinity, starting by about 18,000 years before present (B.P.) (Porter and Swanson, 1998). [1] As the glaciers melted, plant and animal communities became established and able to support prehistoric gathering, hunting, and fishing, with a tundra environment becoming established by about 15,000 B.P. and a forest-parkland environment about 14,000 B.P. (Brubaker, 1991; Whitlock, 1992). In the latter environment, species included scattered trees of lodgepole pine (*Pinus contorta*), alder (*Alnus rubra*), and Douglas fir (*Pseudotsuga menziesii*); and shrubs, bracken fern (*Pteridium aquilinum*), and grasses (Whitlock, 1992). Climatic conditions warmed and dried, even more so than today, expanding the forest-parkland environment until about 7,000 B.P. (Barnosky, et al., 1987).

Climatic conditions similar to the present became established by about 6,000 B.P. Western hemlock (*Tsuga heterophylla*) and successional Douglas fir dominated the forested uplands, while western red cedar (*Thuja plicata*) were found along the stream banks, and marshes occurred in low-lying areas (Brubaker, 1991; Whitlock, 1992). Deer (*Odocoileus* sp.) and elk (*Cervus canadensis*) were probably more abundant in stream valleys than upland forests. Environments along water bodies generally supported more varied plant and animal resources useful to humans, including wetland plants, waterfowl, and large and small game. Mercer Slough and its tributaries (Kelsey Creek and Sturtevant Creek), and the Sammamish River and its tributary (Bear Creek), have supported a variety of abundant resources, including a combination of anadromous Chinook (*Onchorynchus tshawytscha*), coho (*O. kisutch*), and sockeye (*O. nerka*) salmon (Williams, et al., 1975), as well as resident fish and freshwater mussels.

5.2 Geomorphic Setting

Geomorphology refers to the study of landforms, and the history of their development of geologic features. The most recent glacial advance, the Vashon stage of the Fraser glaciations, formed most of the present geologic and topographic conditions (Jacobs Associates, 2007:3). The ice sheet deposited a mixed assemblage of lacustrine deposits, outwash, glaciomarine drift, and till. Erosion and deposition have influenced the preservation of the glacial deposits, covering them in places with recent stream and river alluvium. The general environments for the deposition of archaeological remains include the tops of glacial deposits, where archaeological materials would be found within a short distance beneath the ground surface; stream deposits, where the materials could be buried to some depth; and river deposits, where they could be buried deeply. In addition, modern fill, often topped by asphalt, concrete, or gravel, occurs throughout the project vicinity, to varying depths. This fill could cover archaeological resources and may contain some historic-period remains. Where developers scraped glacially derived or shallow alluvial soils before placing fill, they likely destroyed or disturbed any archaeological deposits that may have been present. In downtown Bellevue, for example, project geotechnical work revealed fill to between about 8.5 and 10 feet below ground surface in six borings, underlain by glacial till or outwash, with glacial till to about 10 feet in one boring and outwash to about 6 feet in another (Jacobs Associates, 2007).

---

[1] Before present is an archaeological term that considers radiocarbon dating at a specified point in time. Standard practice is to make time relative to January 1, 1950.

The Seattle earthquake fault zone includes the area around I-90, from Seattle to south Bellevue (Jacobs Associates, 2007:5). It is west trending and about 4 to 6 kilometers (2.5 to 3.75 miles) wide. Quaternary sediment has been folded and faulted along the zone. This fault has been the source of prehistoric and historic-period earthquakes that have affected human use of the project vicinity and archaeological sites located there. An earthquake about 1,000 to 1,100 years ago caused 23 feet of surface displacement (Jacobs Associates, 2007:5). Deposits in Redmond's Marymoor Park suggest that land at the north end of Lake Sammamish, near the project vicinity, dropped by 3 feet or more and a large wave from the lake washed north into the Sammamish River valley, covering the river's floodplain and the archaeological sites located there (Lewarch, et al., 2000:9).

The East Link alternatives traverse areas of glacially derived soils throughout most of Segments B, C, and D, except where the alternatives are located near streams or wetland areas. In particular, Segment B soils tend to be formed on terraces along or near Mercer Slough. By contrast, much of the Segment E soils consist of Sammamish River alluvium.

6.0 Cultural Context

This section discusses the previous cultural resource management studies, prehistory, ethnography, and history of the project vicinity to establish a context from which to evaluate the significance of archaeological and historic resources.

6.1 Previous Cultural Resource Management Studies

Numerous cultural resource management investigations have taken place in the project vicinity, as listed in Appendix F. Most of the studies have been conducted for transportation-related projects, although others include the Sammamish River Trail and park developments, commercial and residential developments, fiber optic cables and communication towers, and study of an archaeological site in Marymoor Park. The City of Bellevue conducted a survey of its historic properties in the 1990s (Tobin and Pendergrass, 1997). The studies have recorded few NRHP-eligible historic properties, two of which are located in the project APE.

6.2 Prehistory

Most archaeologists agree that human occupation and the use of inland western Washington has been continuous from approximately 10,500 years ago. The earliest sites consist of lithic scatters, possibly including leaf-shaped projectile points, which may be the remains of broad-spectrum foraging camps or hunting and gathering activity areas. Over time, changing aboriginal technology and site locations suggest increased sedentism and specialization in the use of particular environments and resources (Ames and Maschner, 1999; Samuels, 1993).

Several chronological sequences describe the timing and nature of cultural change in the Pacific Northwest. Table 6-1 shows a regional chronology for the Pacific Northwest coast, based on the work of Ames and Maschner (1999), that divides prehistoric occupation into five developmental periods. In general, Ames and Maschner's model suggests a shift from small groups relying on generalized hunting and gathering to larger groups with increasing social complexity and specialized reliance on aquatic resources.

TABLE 6-1
Ames and Maschner's (1999) Model of Prehistoric Change in the Puget Basin

Dates	Period	Land Use	Settlement	Subsistence	Technology
14,000 BC to 10,500 BC	Paleoindian	Generalized marine, littoral, and/or terrestrial	Short-term use of pit houses and shelters	Generalized marine, littoral, and/or terrestrial	Stone; bone, antler, and perishable materials likely
10,500 BC to 4,400 BC	Archaic	Generalized littoral, neritic, and terrestrial	Short-term use of pit houses and shelters	Generalized littoral, neritic, and terrestrial	Stone; some bone and antler; other perishable materials likely
4,400 BC to 1,800 BC	Early Pacific	Littoral, neritic, and terrestrial	Increased sedentism in seasonal villages	Increased focus on littoral resources and expanded use of neritic resources	Increase in ground stone, bone, antler, and perishable materials
1,800 BC to AD 200/500	Middle Pacific	Neritic, littoral, and terrestrial	Winter villages of plank houses and seasonal camps	Increased focus on marine and riverine resources; food storage technologies developed	Decrease in stone; diversification of tools and tackle of bone, antler, and perishable materials
AD 200/500 to c. AD 1775	Late Pacific	Neritic, littoral, and terrestrial	Large permanent villages and special use sites	Specialized marine, riverine, littoral, and terrestrial resource use and management; extensive food storage.	Tools and tackle of bone, antler, and perishable materials; very little stone

6.2.1 Paleoindian (14,000 BC to 11,000 BC)

The Paleoindian period includes the earliest evidence of movement of peoples from eastern Siberia onto the North American continent. Currently a few small sites with tool assemblages, dominated by basalt cobble choppers, flaked scrapers, and finely crafted fluted lanceolate Clovis projectile points, characterize the period. These artifacts suggest a highly mobile and opportunistic culture, adapted to the rapidly changing environments and ocean levels that followed the retreat of the glacial ice caps.

6.2.2 Archaic (10,500 BC to 4,400 BC)

Continued tectonic activity and fluctuation of ocean levels have contributed to the paucity of information regarding this period. Sites in the Pacific Northwest tend to consist primarily of surface scatters with shallow buried components. Time-sensitive lithic tools provide the only chronological reference, because little organic material has survived. Large bifacial, leaf-shaped artifacts, dating from 7,000 BC to 4,300 BC, dominate assemblages (known as Old Cordilleran) of this period. Subsistence strategies during this period include flexible technologies and broad skill sets applied to the exploitation of neritic (i.e., the ecological zone of the continental shelf extending from low tide to a depth of about 100 fathoms [about 180 meters]), littoral (i.e., the region of the shore of a lake, sea, or ocean), and terrestrial (i.e., land) resources. The archaeological record suggests populations were small, mobile, and did not develop technologies to store food.

6.2.3 Pacific (4,400 BC to About AD 1775)

The Pacific period is divided into the Early, Middle, and Late (described below), terminating around AD 1775 with the first European-introduced smallpox epidemic. In general, hunter-gatherer cultures increased in complexity during this period, with intensified use of specialized resources, settlement in permanent village sites, and the development of social stratification.

6.2.3.1 Early Pacific (4,400 BC to 1,800 BC)

The Early Pacific, also described as the Cascade Phase (Suttles and Lane, 1990), includes the first clear indication of the use of specialized resources, such as camas (*Camassia quamash*) and shellfish. This phase is characterized by an overall increase in food production with a focus on intertidal resources, as illustrated by numerous shell midden sites. These sites also indicate an increase in sedentism.

6.2.3.2 Middle Pacific (1,800 BC to AD 200/500)

A few coastal Washington sites characterize the Middle Pacific. These sites include large shell middens, remains of large rectangular cedar plank houses, and large canoes. The tool assemblages reveal an increase in complexity and an array of tools manufactured from antler and bone. Subsistence strategies include an intensification of fishing technologies and a growing reliance on food storage.

6.2.3.3 Late Pacific (AD 200/500 to About AD 1775)

Because sites dating to the Late Pacific are more common and have been studied more intensively, this period is better understood that the previous ones. Villages often consisted of large cedar plank houses, with ceremonial, artistic, and utilitarian artifacts. Items made of bone, antler, and wood largely replaced chipped stone tools. Both terrestrial and marine resources supplemented intense use of specific resources, such as salmon and root crops.

6.2.4 Project Vicinity Prehistory

Eleven prehistoric archaeological sites have been recorded in the project vicinity, and two have received more intensive testing and study. Table 6-2 summarizes information on these sites, most of which are located in the Sammamish River valley or along its tributaries. A cluster of sites has been recorded in Marymoor Park, along the upper Sammamish River, in the vicinity of the historic confluence of Bear Creek, and downstream from the historic shoreline of Lake Sammamish. The sites include 45KI9A/9B (called the Marymoor site) and 45KI10, recorded as a result of University of Washington archaeological studies in the area. Sites 45KI266, 45KI492, and 45KI493 also were recorded in Marymoor Park and were encountered during excavations for utilities. Northeast of the current confluence of the channelized Bear Creek and the Sammamish River, investigations in 2008 recorded prehistoric site 45KI839 (Hodges et al., 2009; Rinck, 2008).

TABLE 6-2
Previously Recorded Prehistoric Sites Recorded within the Vicinity of the East Link Project APE

Site Number and Name	Landform	Description	Reference
45KI8	Along Sammamish River banks, near mouth of Bear Creek	Prehistoric lithic scatter with large stemmed projectile point, two small leaf-shaped points, basalt blade fragment, adze blade fragment; historic whetstone fragment; also reported fluted point; disturbed context; location could not be verified in East Link Project fieldwork	Greengo ,1968; Greengo and Houston, 1970
45KI9A&9B Marymoor Site	Sammamish River banks	Prehistoric midden with a variety of lithic artifacts, thermally altered rock, and bone and shell fragments	Greengo, 1968; Greengo and Houston, 1970
45KI10	Sammamish River bank/ terrace	Small prehistoric site with basalt blades, corner- and side-notched projectile points, scrapers, choppers, and fire-cracked rock; also two basalt cores and flakes of basalt, cryptocrystalline silicate, and an unidentified material; disturbed context	Greengo, 1968; Greengo and Houston, 1970
45KI266	Sammamish River valley	Prehistoric fire pits and lithic artifacts; reported about 1979; destroyed by 1984	Elvidge, 1984
45KI466 Bear/Evans Creek Site	Confluence of Bear Creek and Evans Creek; also on upper terrace	Possible prehistoric campsite and historic road bed; basalt, jasper, and petrified wood flakes, chunks, cores, and chipped cobbles (13 artifacts); crushed rock, clear and green flat glass, coal slag; metal fragments	Norman, 1999a and 1999b
45KI467 Union Hill Road Site	Upper/Pleistocene terrace	Prehistoric lithic and historic debris scatter, with small lanceolate projectile point of petrified wood, jasper flake fragment, two pieces of amethyst bottle glass	Norman, 1999a and 1999b
45KI492	Sammamish River valley	Prehistoric burn feature, basalt cobble spall, cryptocrystalline silicate interior flake, and fire-modified rock; charcoal date of 3,220 – 3,060 B.P.	Nelson, 2000
45KI493	Sammamish River valley	Prehistoric burn feature, two cryptocrystalline silicate interior flakes; charcoal dates of 2,370 – 2,230 B.P. and 2,600 –2,460 B.P.; disturbed context	Nelson, 2000
45KI718 Eastern Terrace Site	Terrace above tributary to Kelsey Creek	Prehistoric lithic scatter with Cascade point, biface, and other chipped stone of cryptocrystalline silicate (11 artifacts); disturbed context	Cooper, 2005
45KI839	Bear Creek/Sammamish River floodplain	Prehistoric lithic scatter including fire-cracked rock concentration, flakes, and flaked-tool fragments	Rinck 2008
45KI941	Marymoor Pet Garden	five flake fragments/debitage and one unidentified mammal bone fragment found along the southern boundary of the Pet Garden	Hoyt, 2009

The reasons for the cluster of prehistoric sites in Marymoor Park likely include the local diversity of stream, lake, marsh, and upland environments, which provided abundant salmon and other fish, plants, waterfowl, and mammals. In addition, the park has saved the area from wholesale development, while requiring archaeological survey and monitoring of excavations within the park. This has provided some protection for the sites, as well as the means for finding and investigating them. The sites have received varying degrees of disturbance from historical and modern activities.

Marymoor site locus 45KI9A has received the most study. Two layers of dark midden soil with thermally altered rock, bone, and shell fragments, and artifacts that include projectile points, large blades, and microblade cores, scrapers, gravers, choppers, flake tools, quartz crystals, and pieces of ocher pigment characterize the deposits. Two radiocarbon dates suggest occupation, hunting, and fishing around 2,500 years B.P. (Greengo, 1968; Greengo and Houston, 1970). Nearby, locus 45KI9B appears to have been used later; its assemblage of ground stone adze blades, barbed projectile points, worked and unworked bone, earth oven, stone pendant, and salmon and mollusk remains suggest occupation, fishing, woodworking, hunting, and plant processing (Greengo and Houston, 1970).

Site 45KI10 was recorded as a small, disturbed site with basalt blades, corner- and side-notched projectile points, scrapers, choppers, cores, flakes, and thermally altered rock (Greengo, 1968). Three other prehistoric archaeological sites have been recorded in Marymoor Park. Site 45KI266 consisted of prehistoric fire pits and lithic artifacts; originally recorded in 1966, the site was reported destroyed in 1984 (Elvidge, 1984). Sites 45KI492 and 45KI493 consist of prehistoric burn features and stone flakes, with radiocarbon dates of 3,220 to 3,060 B.P. and from 2,370 to 2,230 B.P. to 2,600 to 2,460 B.P., respectively (Nelson, 2000).

Site 45KI8 was recorded north of Marymoor Park, along the Sammamish River at Redmond (Greengo, 1966 and 1968); it is discussed in Section 7.1.1 below. Sites 45KI466 and 467, near the confluence of Bear and Evans creeks, were recorded during monitoring for excavations associated with the Millennium Corporate Center (Norman, 1999a and 1999b). Located close to the creek confluence, 45KI466 consists of a possible prehistoric campsite and historic road bed. Prehistoric artifacts included basalt, jasper, and petrified wood flakes, chunks, cores, and chipped cobbles, while historic-period artifacts included crushed rock, clear and green flat glass, coal slag, and metal fragments. Located south and west of the creek confluence, 45KI467 consists of a prehistoric lithic and historic debris scatter, with a small lanceolate projectile point of petrified wood, a jasper flake fragment, and two pieces of amethyst bottle glass.

Site 45KI839 was recorded during a cultural resources assessment for the proposed rehabilitation of Lower Bear Creek, northeast of the confluence of Bear Creek with the Sammamish River. The site includes cultural materials that appear to date to several thousand years old (based on radiocarbon dates of associated peat layers). The items in the lithic scatter, including a concentration of fire-cracked rock, fine-grained flakes, and several tool fragments, were observed below silty, clayey 'diatomaceous' earth, in association with deposits of peat, at 4.3 to 5.9 feet (1.3 to 1.8 meters) below surface (Hodges et al., 2009; Rinck, 2008). Archaeologists continued testing of the site into 2009, and are currently analyzing materials for an updated excavation report.

An archaeological survey for a residential development recorded 45KI718, a lithic scatter located on a terrace above a tributary to Kelsey Creek, south of the East Link Project vicinity (Cooper, 2005). Investigations there recovered a Cascade projectile point, a chipped stone biface, and several other chipped stone artifacts in a disturbed context.

6.3 Ethnography

The project vicinity is located in the aboriginal territories of the Duwamish and Sammamish (Haeberlin and Gunther, 1930; Suttles and Lane, 1990). These groups spoke the Lushootseed or Puget Salish language. People lived in winter villages, generally located where rivers and streams entered Puget Sound, near lakes, such as Lake Washington and Lake Sammamish, or at stream confluences. A village was located either at the confluence of Mercer Slough with Lake Washington, or along the slough (Hilbert, et al., 2001:95).

Winter villages consisted of longhouses built from split cedar planks placed on wooden frames, and ranged from one to several houses that sheltered one or more extended family groups. In the villages, people lived during the winter using food and other supplies collected throughout the year and supplemented with fresh foods available nearby. They made and repaired tools, clothing, and other necessary materials in winter, and pursued ceremonial and social activities. Families left their winter villages during the warmer months to fish, collect plant foods and materials, and hunt foods for immediate use and storage for the next winter. They often met other families and groups at locations with abundant resources, and traveled and traded with others. During these months, people camped in portable shelters made of mats stretched over pole frameworks (Haeberlin and Gunther, 1930; Suttles and Lane, 1990).

People gained their subsistence by fishing, collecting plant products, and hunting. Catching salmon in water bodies within the East Link Project vicinity was an especially important economic activity. Many fishing implements were utilized, including weirs and spears, traps, and dip nets. Freshwater fish, including trout, were taken from streams and lakes. Eels and freshwater mussels also came from streams. Plants used for food, medicines, and technological activities included shoots; camas bulbs; roots, such as wapato; and berries. Cedar trees provided materials for houses, canoes, mats, baskets, rope, and clothing. People used bows and arrows, pitfalls, and snares to hunt large and small game, often catching waterfowl in aerial nets. The Duwamish and

Suquamish also collected resources from Puget Sound, including shellfish, seals, and fin fish (Haeberlin and Gunther, 1930; Suttles and Lane, 1990).

Background research reveals Indian place names for villages and other uses occur along the Segment B alternatives in the vicinity of Mercer Slough, and along the Segment E alternatives in the vicinity of the Sammamish River. The place names correlate with areas analyzed as archaeologically sensitive. A promontory along Lake Washington, just west of the Mercer Slough confluence, was called *Tl^{3}utsa^{3}lus* ("tying a mesh"). *Sa'tsakaL* ("water at head of a bay"), the place name for Mercer Slough, and represents an old village site where the people were called *Sa'tsakalEbc*. It was reported to have been the staging place for the native attack on Seattle in January 1856 (Hilbert, et al., 2001:95). The place was also important in mythology (Hilbert, et al., 2001:46, 95).[2]

The place name for the Sammamish River was *sts!ap* ("crooked," "meandering") and for Redmond was *TL^{3}oq^{3}* ("crowded in, poked in"), while *Ceqos-a'lt^{u}* ("a high place with a house on it") denoted a creek entering the Sammamish River "from the east below Redmond" (Hilbert, et al., 2001:112). While maps of this downriver location should indicate north of Redmond, the maps of place names show this, and a creek called *Tuba'hal* ("broad"), to be located south of Redmond (Hilbert, et al., 2001:112). Possessing a number of upper branches, this was probably Bear Creek.

The earliest effects of Euroamerican contact appeared in Northwest Indian communities before the Euroamericans themselves. Researchers have not yet determined when epidemic diseases first appeared, but Lewis and Clark estimated that smallpox predated their 1805-1806 trip to the lower Columbia River area by about 30 years. Repeated epidemics of various diseases continued to drastically decrease populations (Noel, 1980:66), reducing many by two-thirds or more (Boyd, 1985:398).

Alcohol, disease, and dislocation from traditional territories disrupted the social and political organization of the groups. Euroamericans often hired Indians to act as guides, as transporters of goods and messages, and to hunt, fish, cut timber, and tend herds and crops, all of which took Indian people away from their traditional subsistence-oriented activities (Suttles and Lane, 1990). Reduction of Indian populations also brought changes in subsistence patterns.

In 1855, Washington Territorial Governor Isaac Stevens negotiated the Treaty of Point Elliott with a number of groups, including the Duwamish, Snoqualmie, and Sammamish tribes. The United States intended for the Duwamish Tribe to move to the Port Madison Reservation and the Snoqualmie Tribe to move to the Tulalip Reservation, while the Sammamish Tribe could go to either reservation (Ruby and Brown, 1992:72-73). Although some Indians moved to these reservations or to the Muckleshoot Reservation, others remained near their traditional settlements. The federal government recognized the Snoqualmie Tribe in 1999, but the Duwamish are not yet federally recognized.

6.4 History

The East Link Project would run from the historic International District of Seattle east through the Mount Baker District, across once-rural and now developed suburban and city areas of Mercer Island and Bellevue, and into Redmond. The following information regards the historic development and populations of each of these communities.

The International District, also known as Chinatown, encompasses the blocks east of Fifth Avenue South, west of Boren and Rainier Avenue South, north of South Dearborn Street, and south of South Main Street. The main thoroughfares in the District are South Jackson Street and South King Street, as well as 12th Avenue South intersecting at South Jackson Street.

By 1876, 3,400 people lived in the City of Seattle and 250 of them were Chinese. A small area on Washington Street, between 2nd Avenue and 3rd Avenue, became the City's earliest China Town. Seattle was one of two main ports of entry for Japanese immigrants during the 1880s, with the 1890 census listing 360 Japanese in Washington, most living in Seattle. The Japanese community grew next to that of the Chinese on Washington Street, and spread south past Jackson Street to Weller Street. When the City filled the tide flats south of Jackson Street in 1909, using debris from the Jackson and Dearborn Street regrades, the Chinese community, which had supplied much of the labor for these efforts, moved south to the newly filled area.

---

[2] Orthographic symbols, such as ^{3}, ^{u}, and !, used in archaeological names indicate sounds unique to the Lushootseed language.

Filipinos came to Seattle in large numbers during the early decades of the twentieth century. By 1930, the Filipino population in Seattle had outgrown the Chinese population. At the same time, African Americans also settled in the Central District of Seattle in large numbers. Restrictive covenants prevented these ethnic and racial groups from buying land in many Seattle neighborhoods, prohibitions that encouraged the growth of what would become Seattle’s International and Central districts (Chin, 2001). Seattle’s International District is a National Register Historic District and a City of Seattle Landmark District based on its historic character, and because it is the only pan-Asian American community on the United States mainland (Chin, 2001:10).

Logging started early in the vicinity of Seattle, and the Mount Baker District featured saw and planning mills along its shoreline in the 1890s. Only a few families built houses there before 1905, however, because a small number of individuals and companies owned most of the land, and because people thought of the area as too distant from Seattle. The City's annexation of Mount Baker, in 1907, encouraged growth during the early twentieth century, and landowners platted most of the neighborhood by 1910. The Mount Baker Park Improvement Club discouraged the construction of buildings, other than single-family residences, and enforced restrictive covenants that prohibited selling property or renting apartments to nonwhites or recent immigrants. These restrictions continued until after World War II (Tobin, 2004).

A government land survey named Mercer Island after pioneer Thomas Mercer in 1860. The island’s first post office, in the early settlement called East Seattle, opened in 1904. Passenger ferries connected the island with Seattle and Bellevue until the first bridge opened in 1923, which allowed vehicle traffic between Mercer Island and Bellevue. Population increased dramatically and, in 1924, the name of the settlement changed to Mercer Island. The island remained relatively rural until 1940, when the increasing population of Mercer Island and the resulting vehicle traffic necessitated construction of the Lake Washington Floating Bridge and the replacement of the East Channel Bridge. The population grew from 1,200 to 4,500 between 1940 and 1950 and then nearly doubled in the next 3 years. Voters rejected the first referendum on incorporation in 1945 and the next in 1953. In 1960, Mercer Island finally incorporated as a city and the downtown business district incorporated as a town—both named Mercer Island. This situation continued for a decade until the two governments merged in 1970.

The first settlers, William Meydenbauer and Aaron Mercer, both arrived in the area that would become Bellevue in 1869. Each settled in a coastal area that would come to bear his name, Meydenbauer on the bay and Mercer to the south along the slough. Isaac Bechtel purchased land near the current downtown area in 1883, working with his sons to log and clear the land. By 1890, shingle mills and a sawmill had begun operation and settlers had moved onto the cleared land. By 1900, the area had 400 residents. At that time, the Hewitt Lumber Company employed hundreds of men to log timber from the Wilburton vicinity, near the present day intersection of 116th Avenue SE and SE 8th Street, west to Lake Sammamish and south to Kennydale (Wilma, 1999). They hauled the logs overland and floated them down the Mercer Slough.

Before the Lake Washington Ship Canal opened in 1917, Mercer Slough included several boat landings and extended north nearly to Main Street, where a lumber mill operated at the community of Wilburton (Krafft, 1991). Operation of the Ship Canal lowered the level of Lake Washington, destroying the navigability of Mercer Slough and creating new farmlands in the rich bottomland soil. Residents grew holly trees; azaleas; bulbs, such as daffodils and iris; and berries.

The settlement of Lake Washington was spurred by industrialists such as William Renton and Peter Kirk, who constructed plants, platted towns, and contracted railroads to build spur lines to their developments. The Northern Pacific Railroad constructed the Lake Washington Beltline Route, which ran from Renton to Kirkland, in 1891. The route passes through Bellevue, roughly along the I-405 corridor. In the early years, this route was primarily used to transport coal and iron from the Cascade foothills in the vicinity of Redmond to steel plants in the Kirkland area (Allen 2007:4).

Post-World War II population growth spurred the development of Bellevue. Developer Kemper Freeman opened Bellevue Square, the first shopping mall on the Eastside, in 1946. In 1952, Roxbury Homes purchased 80 acres that had been a filbert farm, platting the area as “Surrey Downs Addition No. 1.” The residential subdivision eventually included about 200 houses, with the optimism of the period showing in the modern Northwest design of the houses. The City of Bellevue incorporated in 1953 (Stein, 1998).

Luke McRedmond, who came to the United States from Ireland, established the City of Redmond. He first settled in Seattle in 1865 and then staked a claim just north of Lake Sammamish in the early 1870s. McRedmond started a dairy farm and founded the Seattle and International Railroad. He was involved in the Black Diamond coal mines, and served as justice of the peace and the first postmaster, changing the community’s name from Willows to Redmond. McRedmond’s daughter Emma, born in Seattle in 1869, served as Redmond’s postmistress for years, beginning at the age of 16. In 1898 she married William White, who would become a justice of the Washington State Supreme Court; their house is one of the oldest extant buildings in Redmond (Hanscom, 1979).

The Seattle, Lake Shore, and Eastern (SLS&E) Railway incorporated in 1885, and it was purportedly conceived as a response to Seattle’s rival city Tacoma being selected as the terminus to the Northern Pacific Railroad’s transcontinental line. By 1886, the line reached from downtown Seattle to the town of Ballard. By 1889, the line extended for 63 miles out of Seattle, reaching just past current-day North Bend (Martin, Jr., 2009).

Redmond had a train station with both freight and passenger service. Although there was some logging in the area before operation of the railroad, those efforts were limited. The sawmill began operation about 1890. Local logging increased as companies used the freight service to ship their lumber, thereby allowing the logging companies and mills to employ hundreds of men (Bagley, 1929:849). Redmond’s hotels and restaurants benefited from the passenger service. Trains stopped in Redmond twice each day, serving schoolchildren, businessmen, people who shopped in Seattle, and the postal service, among others (MacIntosh, 1999b).

In 1892, the Northern Pacific Railroad acquired the SLS&E Railway line and operated it for just over a year. In 1893, the railroad was operated under the reorganized Seattle & International Railroad and Spokane & Seattle Railroad. By 1901, the Northern Pacific had re-absorbed this railroad, and they continued to operate the line, under its Snoqualmie Branch, until 1970, when the Burlington Northern purchased it (Northern Pacific Railway Historical Association, 2007). The railroad depot in Redmond, which had been open since 1889, closed in 1970. The building was demolished in 1972, but BNSF still owns much of the railroad right-of-way through Redmond (King County Property Records 2007, 2010; MacIntosh, 1999a). Many of the oldest buildings in Redmond are located near the former location of the depot, which was close to the intersection of the SLS&E and Leary Avenue NE. Table 6-3 lists historic-period archaeological resources that have been recorded in the vicinity of the East Link Project APE. The majority of these sites are located in downtown Seattle, and their contents reflect the history of the city. The sites range from scatters of industrial and domestic debris (45KI924, 45KI947), historic-period construction remnants (45KI765, 45KI943), and railroad properties (45KI930) associated with the various stages of development, from filling the Elliott Bay tidelands to the construction of the city.

Site 45KI451, the SLS&E Railway grade, was originally recorded as an archaeological site to within a few hundred feet east of Segment E in Redmond. The railroad grade continues into the APE and had been recorded as a Historic Property (Adams and O'Brien 2007b; HPI 1256-117 [Appendix C]), but had not been recorded as an archaeological site before the 2010 survey for the Project. In addition, the Frederick Winters House, located along Bellevue Way SE and discussed in Section 7.3.2 below, is recorded as 45KI606, although it is not an archaeological property. North of Redmond, and outside of the immediate vicinity of the Segment E route, the Moore Farmstead is recorded as 45KI543.

In 2007, Archaeological Investigations Northwest, Inc. (AINW) conducted a historic resources survey along segments of former BNSF Railway grades in Redmond and Bellevue, Washington, ahead of proposed abandonment by BNSF (Allen, 2007). The three segments surveyed—mile post (MP) 5.00 to 10.60 and (MP) 11.25 to 23.9 on the former Northern Pacific Lake Washington Beltline Route, running from Renton to Woodinville, and MP 1.86 to 7.30 on the former SLS&E rail line between Woodinville and Redmond—were recorded on HPI forms as historic period railroad properties. These segments contain six historic-period trestles and bridges, which were constructed between 1904 and 1960. AINW recommended the segments of historic-period railroad eligible for listing in the NRHP under Criterion A, with the bridges/trestles considered to be contributing elements.

TABLE 6-3
Previously Recorded Historic Sites Recorded within the Vicinity of the East Link Project APE

Site Number and Name	Landform	Description	Reference
45KI451	Multiple – locally Bear Creek/ Sammamish River floodplain	Railroad properties associated with Seattle, Lake Shore & Eastern Railway, constructed from 1885 to the 1890s. Includes sections of railroad grade, trestles, and associated artifacts	Hamilton and Johnson, 2004; Hudson and Nelson, 1997; LeTourneau, 2005; LeTourneau and Sundberg, 2009; Luttrell, 2007; Murphy and Iverson, 2000; Nelson, 2001; Norman, 2001; Sparks, 2006
45KI765 Sixth Avenue South Refuse Deposit	On 6th Avenue South between Royal Brougham Way and South Massachusetts Street	Historic debris concentration associated with pilings that formed the supports of Sixth Avenue South. The site is the result of numerous dumping episodes spanning a period of 33 years, from 1890 to 1923. Material collected include bottles, ceramics, faunal remains, misc. debris	Fallon, 2006
45KI924 Dearborn South Tideland Site	Filled tidelands	Historic commercial, industrial, and residential properties	Shong, 2009
45KI930	200 feet east of modern, constructed Puget Sound shoreline, 110 feet southeast of South King Street and Railroad Way South	Historic railroad properties	Gilpin, 2009
45KI942 W.L. McCabe's Machine Shop Site	Filled tidelands	Dimensional lumber, coal clinker deposits, and domestic and personal materials c. 1895.	Meyer, 2009
45KI943 Dearborn North Tideland Site	Filled tidelands	Historic commercial properties	Shong, 2009
45KI947	Duwamish River/filled Tidelands	Truncated historic surface composed of slag pits, lens of historic debris, scattered bricks and large depressions filled with concrete rubble and dimensional lumber.	Meyer, 2010

According to AINW, the railroad lines are associated with the development of railroads in the Puget Sound region, and more locally with the development of industry (e.g., coal mining and steel plants) in the area (Allen 2007:2-3). DAHP concurred with this recommendation on July 19, 2007, (Lake Washington Beltline segments) and on April 30, 2009 (SLS&E segment) (Allen and O'Brien 2007a, 2007b). At the time of the East Link Project Historic Properties survey in 2007, the Washington Beltline segment was still in operation, hosting the Spirit of Washington Dinner Train and a few freight trains.

The East Link project affects segments of the former BNSF corridor. These segments were reviewed for eligibility to the NRHP and it was determined that none of these segments are eligible to the NRHP.

7.0 Affected Environment

7.1 Archaeological Properties

7.1.1 Previously Recorded Archaeological Sites

Two archaeological sites (45KI8 and 45KI451) have been recorded in proximity to the East Link Project route. Site 45KI8 was recorded in 1966 (Greengo, 1966). The site was said to be located along the Sammamish River and near an old confluence of Bear Creek, near the Redmond Way Alternative (E1). The site was described as consisting of scattered artifact finds along the river for about one-half mile, including some finds in dredged material located on the west bank of the river. A fluted projectile point, which usually denotes ancient occupation, was said to have been found at the site in about 1941. The condition of the site, in 1966, was reported as “completely worked over on surface—no midden visible” (Greengo, 1966).

Various segments of SLS&E Railway grades have been previously recorded in King County as archaeological sites 45KI451 (Hamilton and Johnson, 2004; Hudson and Nelson, 1997; LeTourneau, 2005; LeTourneau and Sundberg, 2009; Luttrell, 2007; Murphy and Iverson, 2000; Nelson, 2001; Norman, 2001a; and Sparks, 2006) and 45KI536 (Hungar, 1996; Nelson, 1997; and Norman, 1996). Segments of SLS&E Railroad in Skagit County have been recorded as archaeological site 45SK244 (Norman 2001b) and a portion of the company's grade constructed in Spokane County has been recorded as 45SP643 (Emerson 2009a, 2009b). The segments in King County have been recorded from as close to the Project area as the east side of State Route 520 (and adjacent to HRA Survey Tract 11F) to the towns of Issaquah, Snoqualmie, and North Bend. Construction on the SLS&E began in Seattle in 1887. Through the years, the railroad changed hands, operating under the Northern Pacific, the Seattle & International Railway Co., and finally (by 1970) the Burlington Northern Railroad (Hudson and Nelson 1997).

7.1.2 Results of Archaeological Sensitivity Mapping and Implications for Archaeological Resources

The application of the landform criteria for archaeological sensitivity (see Section 3.3.1) identified several portions of the alternatives as having high sensitivity for prehistoric archaeological sites, while use of the historical criterion did not identify areas with a high sensitivity of historic-period archaeological sites. Examination of land patents and early GLO survey maps did not reveal historical building sites within the APE, and early agricultural use often did not leave archaeological deposits at locations removed from building sites. Historical uses, revealed by the Sanborn Fire Insurance maps, included commercial and industrial uses, such as an automobile repair shop in Bellevue and railroad tracks and a nearby depot in Redmond. These uses are well documented in the historical record, but no early tenements, apartments, small stores (that might have had living quarters), hotels, or other buildings that might have resulted in archaeological remains and contributed important information to the historical record, were found on the Sanborn Maps. Exhibits B-1 through B-5 in Appendix B show the relative amounts of high-sensitivity APE within each of the East Link alternatives, according to the project and DAHP sensitivity models. The relative amounts of high, moderate, and low-risk areas are described in the text below.

7.1.2.1 Segment A

Exhibits B-1 through B-5 in Appendix B show areas judged to have high prehistoric archaeological sensitivity for the project alternatives, as determined by the project predictive model. Segment A was not mapped because most of the APE in this segment was previously disturbed for the construction of I-90 and the project would be constructed on I-90. Although the DAHP sensitivity model shows high sensitivity for several portions of Segment A (particularly along I-90 on Mercer Island), no archaeological sites could be expected in the APE of Segment A. A small portion of Alternative A1 occurs on the east bank of Lake Washington, in an area considered to have high sensitivity for archaeological remains, according to both models.

7.1.2.2 Segment B

According to the DAHP model, the Segment B alternatives have a high to very high sensitivity for archaeological resources because of their proximity to Mercer Slough, especially its confluence with Lake Washington, and to the

Kelsey Creek and Sturtevant Creek confluences. The same is true for the project model, except for the portion of Alternative B1 where it follows Bellevue Way NE, which is not considered to be high probability. However, the area encompassing the Segment B alternatives has been extensively developed, with considerable disturbance to native soils that could have disrupted or destroyed archaeological deposits. These landforms have a high sensitivity for archaeological resources, although none may be found or be intact if identified because the area is highly developed and has been disturbed through development over the years. The portion of all Segment B alternatives along the I-90/Bellevue Way off-ramp is judged sensitive because, even though it follows I-90, it is located on old shoreline. Alternative B7 is located on uplands east of Mercer Slough and, of the five Segment B alternatives, the DAHP model assigns this the consistently lowest sensitivity (still, almost all of it is "high risk," see Appendix B). According to the sensitivities developed by Project archaeologists, Alternative B1 has the least amount of land considered to have high archaeological sensitivity, while Alternative B7 has the most.

7.1.2.3 Segment C

Most of Segment C is highly developed. In glacial till soils typical of eastern King County highlands, including the Bellevue core, sediments of an age that could include archaeological deposits are shallow, in the top meter or less below ground surface. Of course, if native soils have been buried by historic-era fill episodes archaeological materials can occur more deeply. Geologic explorations have show a thin layer (5 to 10 ft) of sandy material of non-native material from probably placed for roadway construction – over very dense sands and gravels, which appears to be glacial till. None of the recent explorations encountered any recent material (post glacial) show native soils (containing organics or archaeological remnants).

According to the project sensitivity model, portions of Segment C alternatives have a high sensitivity for archaeological resources because they travel along, or near, Sturtevant Creek or other freshwater resources. Portions of Alternatives C1T and C2T pass Lake Bellevue and cross Sturtevant Creek, where archaeological resources could be buried within the floodplain. The DAHP archaeological sensitivity model shows highest-risk areas in the southern and western portions of Segment C. As with the project model, the initial portions of *Preferred Alternative C9T* and Alternative C3T and Alternative C4A, until reaching the vicinity of Main Street, are high to very high risk areas for prehistoric archaeological materials.

To the north along 108th Ave NE and 110th Ave NE, Alternatives C3T and C4A transition to a less sensitive moderately low risk zone by NE 8th Street. The portion of *Preferred Alternative C9T* crossing I-405 and Sturtevant Creek retains moderate to high risk (reflected by the project model). The DAHP model differs, however, along Bellevue Way SE and 106th Ave SE (Alternatives C1T and C2T). These alignments range from very high to moderate risk for prehistoric archaeological materials. However, given that these areas have been moderately to highly developed over the past several decades and there are no apparent stream crossings nearby, it is unlikely that archaeological materials will be uncovered.

7.1.2.4 Segment D

The Segment D alternatives also are located in heavily developed areas. According to the project sensitivity model, portions of the Segment D alternatives have a high sensitivity for archaeological resources where they cross streams, such as the West Tributary of Kelsey Creek. In addition, part of *Preferred Alternative D2A* and Alternative D5 follow the uplands above the Sammamish River floodplain; such locations were often attractive for Native American groups for processing resources, camping, and even living for longer time periods. The DAHP model, however, shows Segment D as moderate to moderately low risk for prehistoric archaeological remains. At the West Tributary to Kelsey Creek, crossing along *Preferred Alternative D2A* and the D2A design options, the DAHP model shows a high risk (and this is within the larger project high probability area). Likewise, a second tributary to Kelsey Creek, located where these alternatives turn from NE 16th Street to the northeast, also shows a high probability, according to the DAHP model.

7.1.2.5 Segment E

The Segment E area is less heavily developed and retains more green space. The Segment E alternatives (E1 and E4) are considered to have a high to very high sensitivity for archaeological resources, according to both models. This is especially true near the crossings of Bear Creek and the Sammamish River, where some terraces are present and where archaeological resources may be buried within flood deposits.

7.1.3 Results of Archaeological Survey

The archaeological surveys conducted in 2007 and 2010 did not uncover any additional resources eligible for the NRHP. The archaeological survey took place during the last week of February 2007 and in March, June, and July 2010, with a field director and a crew of two to four archaeologists. The 2007 field survey included 15 survey tracts (Draft EIS tracts 1D to 16D), and the 2010 survey included 12 survey tracts (Final EIS tracts 1F to 12F). Of the 12 proposed 2010 survey tracts, two (Survey Tracts 5F and 6F) could not be surveyed because Sound Transit was denied entry for archaeological studies. Within each surveyed tract, the crew walked defined paths, or transects, and recorded observations; conducted shovel probes, depending on surface and perceived subsurface conditions; and screened materials. Shovel probes were spaced throughout the survey tracts, at intervals no greater than 20 to 25 meters (66 to 82 feet).

Twelve survey tracts were located in the archaeologically sensitive portions of Segment B; seven were located in Segment D (five Draft EIS tracts and two Final EIS tracts); and eight were located in the archaeologically sensitive portions of Segment E (four Draft EIS tracts and four Final EIS tracts). Two Draft EIS survey tracts in Segment D were placed in areas considered to have low archaeological sensitivity to control for the bias inherent in focusing the survey on high-sensitivity areas. No tracts were placed in Segments A or C during the 2010 Stage 1 archaeological survey because heavy development and other characteristics provide few areas of high archaeological sensitivity. The Stage 2 archaeological survey will target areas of lower archaeological probability and locations that are, according to the DAHP predictive model, of higher sensitivity but currently inaccessible (due to paved surfaces or other factors) or are currently privately owned.

The archaeological survey of the Segment B tracts encountered areas of historical and modern disturbance (for instance, the vicinity of the South Bellevue Park-and-Ride and the landscaping surrounding modern industrial parks), steep slopes in many portions of the *Preferred Alternative B2M*, heavy vegetation, water at or near the ground surface, and modern debris. When cultural materials were observed in shovel probes, they were generally modern or lacking in context (for instance, in fill). Survey tracts in Segment D also showed considerable disturbance, including the observation of asphalt on the surface close to one shovel probe (SP12F-7) and at approximately 30 to 40 centimeters (12 to 16 inches) below surface in two other probes in Tract 12F (SPs 12F-5 and 12F-6); this asphalt may be a remnant of the roadway that existed prior to the development of SR 520.

In Segment E archaeologists encountered fill covering the native alluvial soils at varying depths, up to about 1 meter (3.28 feet) deep. Many shovel probes excavated in Segment E, Tracts 10F and 11F, contained peat layers similar in composition to those observed during archaeological investigation of prehistoric site 45KI832. However, no flakes, fire-cracked rock (FCR) or other prehistoric artifacts were observed in these probes. Project archaeologists searched for traces of previously recorded prehistoric archaeological Site 45KI8 in Segment E, but the work encountered no evidence of the site. It is difficult to tell whether the site still exists because the areas have been eroded, dredged, riprapped, and filled.

The survey located no prehistoric archaeological remains. Although past development has likely damaged or destroyed archaeological sites, particularly those dating to prehistory, some important remains could exist. However, two historic-period archaeological sites were recorded during the 2010 survey session. In Survey Tract 4F of Segment B, approximately 125 meters (425 feet) northwest of the Winters House, the archaeologists observed a scatter of domestic debris. The site extends from the eastern edge of the right-of-way in *Preferred Alternative B2M*, downslope to the level surface of Mercer Slough. The debris included bed components; portions of household appliances (e.g., oven); entire and fragmented colorless and brown glass vessels (identified as soda and beer bottles) and additional pane glass fragments; oil drums; and fragments of automobiles, including a car with a Wisconsin license plate, dated February 1963, and a bus or station wagon parked under large rhododendron bushes outside the Segment B route. These items are scattered over an area measuring approximately 30 meters (98 feet) north-south by 30 meters east-west. Although no historic-period diagnostic artifacts were identified in the APE, it is likely that some components of the site, such as the automobile, can be considered historic-period in age (i.e., older than 50 years). The archaeologists prepared an Archaeological Site Inventory Form for this resource (45KI1008 [Appendix C]).

The archeological survey also found segments of the former BNSF (former Northern Pacific) Railway corridor. As this is a mostly aboveground historic resource, its eligibility for listing in the NRHP is discussed in Section 7.3.

7.2 Traditional Cultural Properties

FTA and Sound Transit sought government-to-government consultation with the Muckleshoot Indian Tribe, Snoqualmie Indian Tribe, Suquamish Indian Tribe, Duwamish Tribe, Tulalip Tribes of Washington, and Yakama Nation, initially providing project information by mail. Meetings were held with Muckleshoot and Snoqualmie tribal representatives to discuss the East Link Project and its potential effects on archaeological sites and TCPs. Consultation with the tribes revealed no TCPs in the project vicinity.

7.3 Historic Buildings and Structures

The historical records search identified several properties listed in the NRHP, the WHR, or local registers. The field survey and preparation of inventory forms took place primarily from February through June, 2007, September through October, 2007, and from December 2009 through April 2010. Project architectural historians' research and field survey inventoried 439 buildings and structures (including one potential historic district with a number of contributing elements) in the APE, with 13 either listed in the National Register (and automatically part of the WHR) or recommended to be eligible (Appendix C). FTA's eligibility determinations were based on criteria for listing in the NRHP and the Washington DAHP (which houses the SHPO). Section 106 of the NHPA requires federal agencies to take into account the effects of their actions on properties that are determined eligible as well as those that are listed. The consent of private property owners is needed before their properties can be listed in the NRHP. As discussed in Section 3.5, above, properties to be listed or considered eligible for the National Register normally must be 50 years old, must meet one of four criteria for listing, and must retain their integrity. Most of the properties inventoried for the project did not qualify for the National Register.

In addition to resources discussed in the remainder of Section 7.3, one potential historic resource, the former BNSF Railway, was surveyed in the APE for multiple project segments. Portions of the former BNSF Railway are within the APE for Segments B, C, D, and E. The portions of the former BNSF Railway within the project's APE are recommended as not eligible for listing in the NRHP, although the railroad as a whole has been determined eligible. These portions are recommended not individually eligible regardless of eligibility of the whole route: under Criterion A (which is what DAHP found the route eligible under). These sections are nondescript and do not well represent the theme asserted in the 2007 HPI (Allen and O'Brien 2007a); under both Criterion B and C, they have not been found to be associated with a master or someone of other historical importance, nor do these segments contain any remnants that are distinctive or that well represent historical railroad themes (Criterion D), such as the trestles and bridges emphasized in Allen and O'Brien 2007a. In summary, significant intact properties representative of the former BNSF Railway's and the preceding owners' contributions to railroad technology are not presented by portions of the former BNSF Railway in these segments of the project corridor.

Table 7-1 summarizes the results of the inventory, which is discussed by segment and alternative in the sections below. Exhibit 7-1 shows the location of the NRHP Eligible resources. A list of inventoried properties is included in Appendix C, along with maps of their parcel locations. Table 7-2 summarizes the properties listed, or recommended as eligible for listing, in the NRHP (and thus also eligible for the WHR). Historic resources are described, by alternative, in following the table. Because landmark register criteria for the cities of Seattle, Mercer Island, and Redmond are similar to those of the NRHP, these properties are also recommended as eligible for the local registers. FTA determines, in consultation with SHPO, NRHP recommendations for eligibility and effect determination. Local jurisdictions review local landmark register recommendations.

7.3.1 Segment A

Survey efforts in the City of Seattle portion of Segment A inventoried 62 properties, of which 6 are listed or eligible for listing in the NRHP and 2 are eligible for listing as Seattle Landmarks (City of Seattle Letter to Sound Transit, May 2008). All of the properties inventoried in Segment A were included in the 2007 version of the Cultural Resources Technical Report for the 2008 Draft EIS except for the Lake Washington Highway Segment of I-90. The W.H. Thompson House at 3119 South Day Street and the Immigration & Assay Building at 851 Airport Way S were both listed in the NRHP. The remaining structures inventoried in Segment A were determined not eligible for the NRHP, although DAHP requested additional information about the Endresen Residence and Romaine Electric building to their eligibility for City of Seattle Landmark status. The letter also requested information regarding the NRHP-eligible I-90 (Lacey V. Murrow Memorial) bridge. Additional information for these resources is included below.

The APE crosses a corner of the Seattle Chinatown NRHP historic district, listed in 1986 under Criteria A. This area is also part of the Seattle International Special Review District. One building that contributes to both districts, the Publix Hotel (Exhibit 7-2), is located within the APE. The architect was J. L. McCauley, who also designed the Rainier Heat and Power Company that was located immediately south of the hotel. The building was originally a workmen's hotel, with three wings containing 211 single rooms and 12 street-level retail bays.

EXHIBIT 7-2
Publix Hotel, 504 Fifth Avenue South

The United States Immigrant Station and Assay Office Building (also referred to as the INS Building) (Exhibit 7-3) is listed in the NRHP under Criteria A and C. However, it is not considered eligible as a potential City of Seattle Landmark. The federal government constructed the building in 1931. James Wetmore, acting supervising architect and designer of many federal buildings during this period, approved the plans for the building. The architecture is a combination of elements from the Neo-classical and Mediterranean styles. The building was Seattle's third immigration building and second assay office.

EXHIBIT 7-3
United States Immigration Station and Assay Office Building, 815 Airport Way South

Because the Chinese Exclusion Acts limited immigration to the United States, and Chinese people of this period typically arrived with poor documentation, most of the immigrants detained in the building were Chinese males. The Immigration and Naturalization Service was still using the building and the detention facilities within it when the building was listed in the NRHP in 1979. The first assay office in Seattle opened in 1898 during the Klondike Gold Rush. Although the amount of gold processed in Seattle dropped steeply within a decade, the federal government kept an assay office in Seattle until 1955 (Lee and Mathison, 1978). The building is not used at present.

EXHIBIT 7-4
Washington Iron Works Pattern Shop, 1101 Airport Way South

The City of Seattle Historic Resources Survey determined that the Washington Iron Works Pattern Shop (also known as the Romaine Electric Building) at 1101 Airport Way South (Exhibit 7-4) appears to meet the criteria of the Seattle Landmarks Preservation Ordinance. An HPI prepared by HRA in 2007 found the property to be ineligible for the NRHP and the Washington Heritage Register due to its lack of association with significant events or persons and it's not being an outstanding example of its architectural style or known to be the work of a master craftsman or architect. Although the building retains integrity of location and design, changes to the building impair the integrity of its materials and workmanship, and changes to the area around it impair the integrity of setting, feeling, and association.

Tax assessor's files date the building, constructed as a pattern shop factory for the Washington Iron Works, to 1920. It is associated with the development of the Seattle tidelands area as a transportation-related industrial and commercial warehouse district, and is specifically associated with an industrial firm that was one of the earliest ironworks manufacturers in Seattle, and which played a significant role in the logging, mining, shipbuilding and airplane manufacturing industries. The tidelands were filled through a series of successive grading and fill projects, between 1895 and 1929, which created developable land that made the expansion of railroad and port facilities possible. This also fostered the development of the area for industrial and commercial use that supported significant economic progress of Seattle in the early twentieth century.

The utilitarian industrial building is a large rectangular, three-story, flat-roofed structure, characterized by the large window openings set within the repetitive bays along the east, west, and south elevations. It retains an industrial character and is one of the few remaining large buildings of its type in an area that was a historically significant industrial district. It also appears to be the only building remaining with associations to one of the most prominent and longstanding local iron working firms.

The City of Seattle constructed the Jose Rizal 12th Avenue South Bridge (Exhibit 7-5) in 1911 after removing a portion of northern Beacon Hill to decrease the grade of South Dearborn

EXHIBIT 7-5
12th Avenue South Bridge, 12th Avenue South crossing of South Dearborn Street

Street. One of Seattle's numerous regrading projects, the Dearborn Street work accomplished the City's goal of creating a route from Puget Sound to Lake Washington at a grade of 5 percent or less. The bridge replaced the section of 12th Avenue S that was removed during regrading, thus maintaining accessibility to the northern part of Beacon Hill (Phelps, 1978:23). The bridge was listed in the NRHP in 1982 based on its engineering design under Criteria C.

WSDOT, on behalf of the Federal Highway Administration and DAHP, identified a segment of I-90 between I-5 and I-405 as eligible for the NRHP under Criteria A and C and Criteria Consideration G. The Lake Washington Highway Segment of I-90 within the right-of-way from milepost 3.4 to 8.9 includes the west end of the Martin Luther King Jr. Way Lid to the east end of the East Channel Lake Washington Bridges. The determination of eligibility documentation included the Mount Baker Ridge Tunnels that were previously listed on July 16, 1982. DAHP concurred in its letter dated November 23, 2009 that this section of I-90 is eligible for the NRHP. This segment of I-90 (Exhibits 7-6 through 7-11) is just over five miles in length and encompasses the entire segment, including the roadway, with character-defining features such as lids, bridges, tunnels, ramps, sound barriers, overcrossings, and undercrossings. Major character-defining features include the Mount Baker Ridge Tunnels; the Lacey V. Murrow and Homer M. Hadley floating bridges; the East Channel Lake Washington Bridges; the Martin Luther King Lid; the First Hill Lid; and the Luther Burbank Lid. The lids have pedestrian and bicycle paths, extensive landscaping, and park areas (Exhibit 7-7).

This segment of I-90 runs through mostly residential neighborhoods. Due to its innovative design, which began in 1957, and its construction, from 1979 to 1993, the highway minimized impacts on surrounding neighborhoods by incorporating nine overpasses and three landscaped lid structures that provide both active and passive recreation opportunities in a 180-acre greenbelt. As a designed transportation system, the highway is planned to function as a whole and to achieve long-term transportation goals, including High Capacity Transit, while respecting the surrounding environment. The I-90 Lake Washington Segment was nominated with Criteria Consideration G, as most of the segment was completed between 1987 and 1992, making it less than 50 years old. Under Criteria Consideration G, a property achieving significance within the past fifty years is eligible if it is of exceptional importance. This segment is of exceptional importance as one of only four interstate system segments identified by WSDOT, in consultation with the FHWA, the Advisory Council on Historic Preservation, and the DAHP, as potentially significant segments of the National Interstate System on the "Final List of Nationally and Exceptionally Significant Features of the Federal Interstate Highway System." Features identified on that list warrant Section 106 review and require a formal determination of eligibility. The NRHP Registration form prepared for the resource supports the inclusion of this segment on that list as a feature of exceptional national significance.

The I-90 Lake Washington Segment is eligible for listing in the NRHP under Criteria A and C. Under Criterion A, the segment is an important component of the National Interstate System and a key piece of transportation history. It was one of the final sections that completed I-90 from Boston to Seattle. More than 25 years passed between initial planning and completion of construction, indicating the extensive considerations of planning, engineering, community involvement, and environmental effects in designing a freeway across Mercer Island, between I-5 and I-405. Its design was the product of an early NEPA challenge, resulting in a significant community and agency planning process that forged the Memorandum of Agreement of 1976.

Under Criterion C, the segment involved innovative engineering incorporating unusual and costly amenities. Interstate 90 incorporates many elements that exhibit outstanding engineering, including the floating bridges and the Mount Baker Tunnels. The original designers took great care to provide a consistent look and feel throughout the segment, and developed the I-90 Architectural Standards to guide their final design effort. The project balanced numerous competing interests to design an innovative and attractive final segment of I-90 that fulfilled its transportation mission while also providing tangible assets for the community. The NRHP areas of significance represented in the property are: Engineering, Transportation, Community Planning and Development, and Landscape Architecture. The property is significant locally, regionally, and nationally. The project, with the world's largest soft-earth tunnel, two floating bridges, and three landscaped lids, won the Presidential Design Award for Excellence, recognized for exemplary federal design achievement and honored for its engineering, energy conservation, and landscape architecture.

The I-90 Lake Washington Segment was designed with a vision for the future, when mass transit would be a necessity. The NRHP registration form notes that a central portion of the roadway, separating the eastbound and

I-90 Lake Washington Segment

westbound sections, was designed to be operated in reverse to facilitate the passage of peak hour traffic or for use by mass transit and emergency vehicles (I-90 Design Team, 1972: 147-155).

When U.S. Secretary of Transportation Brock Adams signed his decision to approve construction of I-90, in 1978, he noted that the facility would be unique in including both highway and transit elements. Adams pointed to the 3-2-3 lane configuration and the environmental amenities that included covered roadway sections, landscaping, and bicycle/pedestrian trails (Exhibit 7-8). The final design of the segment minimized disruption to the community by depressing the roadway and providing overpasses widened to contain plantings and pedestrian/bicycle lanes. Two middle lanes were designated for future mass transit and use in reversible commuting, high-occupancy vehicles/buses, and eventually light rail. Post-tensioned concrete minimized the concrete posts needed for earlier freeways, wasting less open space and providing more open views. Landscaped lids were introduced to provide park areas, including some playfields and passive recreation. In the end, the I-90 Lake Washington Segment achieved both its transportation and community enhancement goals through what is generally considered one of, if not the first, context sensitive design solutions in the country.

EXHIBIT 7-8
View (to the west) of a Landscaped Overcrossing above I-90

With the rise of automobile traffic congestion and suburban sprawl, as well as limited land to develop freeways, interchanges, and parking areas, officials made plans to develop a regional rail-transit system as early as the 1950s. Various reports and studies were produced toward this effort and, by 1964, a report recommended that the design of the third Lake Washington Bridge (now the Homer M. Hadley Bridge) be designed to accommodate the later addition of rapid transit rails. The report pointed out the lack of opening spans made it the only facility that would be adaptable to rail rapid transit operation.

The report also recommended the adoption of a coordinated bus and rail rapid transit plan to guide regional transit development to the year 1985. The report recommended that a regional plan, needed for the year 1985, include a high-speed, high-capacity, grade-separated rapid transit route. This would include a connection to Bellevue across Mercer Island in the median of the I-90 corridor, a station at 81st Avenue SE, and a crossing at the east channel on the planned high-level bridge (De Leuw, Cather & Company, 1965: 17, 31-32, and Plate 9).

EXHIBIT 7-9
Martin Luther King Way Lid, West Portal Pedestrian Tunnel

A 1967 report by De Leuw Cather, Report on a Comprehensive Public Transportation Plan for the Seattle Metropolitan Area, as noted in the NRHP Registration form, recommended including approximately 47 miles of dual-track, grade-separated rail rapid transit routes with about 32 stations and about 24 miles of grade-separated right-of-way for future extension of rail rapid transit routes. One of the four major travel corridors would run east across Lake Washington in the proposed I-90 alignment. The recommendations were then submitted to the State Highway Department. Although a final study report based on the 6-year planning effort released by the King, Kitsap, Pierce, and Snohomish counties and the cities of Seattle, Tacoma, Everett, and Bremerton found that rail rapid transit was not feasible for the region, the City of Seattle started planning separately for mass transit.

EXHIBIT 7-10
Mount Baker Ridge Tunnel, East End of I-90 Tunnel

A transportation system plan for the Central Puget Sound Region, prepared in 1974 by the Puget Sound Governmental Conference (PSGC) recommended providing for an exclusive transit way on I-90 between Seattle and the Factoria interchange and the construction of two flyer stops on I-90. In 1976 a multi-jurisdictional I-90 MOA stated that I-90 would be designed and constructed to allow for future conversion of all or part of the transit roadway to fixed guideway. The MOA committed the parties to further planning and construction of transit access connections, and Federal Secretary of Transportation Brock Adams's 1978 approval of I-90 construction included a condition relating to the provision of transit access (Adams, 1978:4), stating that "public transportation shall permanently have first priority in the use of the center lanes" (Adams, 1978:6).

In August 2004, this MOA was amended to reflect the current and future conditions and demands along the I-90 corridor between Bellevue and Seattle crossing Lake Washington via Mercer Island. These included increased travel growth, changes in travel patterns, and a reduction in transit reliability, as well as adding Sound Transit as a signatory to this agreement. One of the key elements of this amendment was that all parties agree that the ultimate configuration for I-90 between Bellevue, Mercer Island, and Seattle should be defined as High Capacity Transit in the center roadway and HOV lanes in the outer roadways, and further agree that High Capacity Transit for this purpose is defined as a transit system operating in dedicated right-of-way, such as light rail, monorail, or a substantially equivalent system.

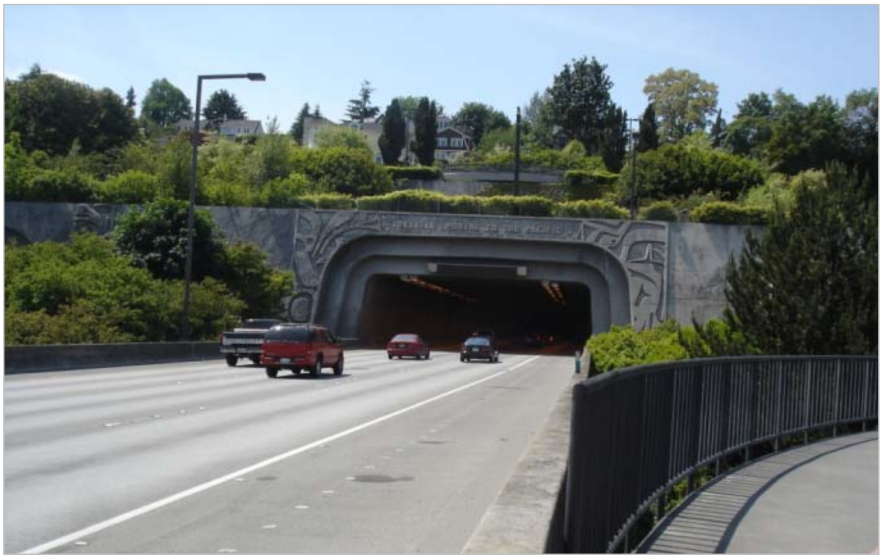

EXHIBIT 7-11
East Portal of the Mount Baker Ridge Tunnel ("Seattle Portal to the Pacific"), Showing Artwork.

Metro's 1984 I-90 Light Rail Conversion Feasibility Study evaluated the extent to which I-90 would provide for rail conversion, and determined the actions that could be taken during the highway's design and construction to preserve maximum flexibility and minimize disruption in operation of the facility resulting from conversion. The report's findings and conclusions included that the I-90 transit lanes could be converted to light rail transit, that there is adequate space for stations, and that no significant additional provisions are required. Report recommendations called for careful attention to character-defining features during final design and construction.

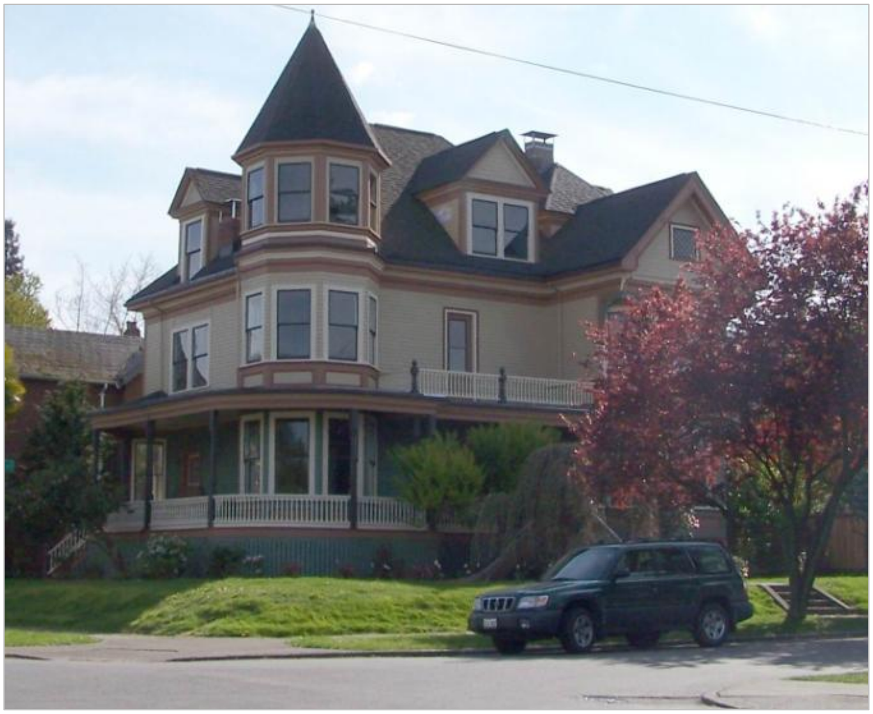

EXHIBIT 7-12
Will H. Thompson House, 3119 South Day Street

The Mount Baker Ridge Tunnels and Eastern Portals (Exhibits 7-9 through 7-11), initially listed in the NRHP in 1982, were included in the I-90 Lake Washington Segment NRHP Registration form prepared in 2009, and are a Seattle Landmark. WSDOT constructed the tunnel, which consists of two parallel sections, in 1940. Because Mount Baker Ridge consists of blue glacial clay, the Highway Department avoided explosives and drilling in favor of excavating both tunnels with an electric shovel. The tunnels' architects designed an impressive gateway to the City of Seattle by combining Art Deco elements and stylized Native American motifs (Soderberg, 1980b). Although the tunnels were an engineering feat, the 1982 NRHP listing focuses on their striking ornamentation.

The Will H. Thompson House (Exhibit 7-12) was listed in the NRHP in 1979 based on its Queen Anne architectural style under Criteria C. This building is unusual for its scale in present-day Seattle and for its high degree of integrity. The property is also a Seattle Landmark. Ernest MacKay constructed the building in 1894 and lived in it until 1897. Will H. Thompson and his wife purchased the house at public auction in 1897, with members of their family living there until 1917. After their son Maurice sold the house, it served as a sanitarium and then a rooming house for women. The La Turner family purchased the house in the 1970s and reversed many

EXHIBIT 7-13
Endresen Residence, 1402 32nd Avenue SE

of the changes made by the sanitarium and rooming house owners (Kreisman, 1979). The building is one of the oldest surviving houses and one of the few examples of the Queen Anne architectural style to survive in the Mount Baker Neighborhood.

The City of Seattle Historic Resources Survey determined that the Endresen Residence at 1402 32nd Avenue South (Exhibit 7-13) in Seattle's Mount Baker Neighborhood appears to meet the criteria of the Seattle Landmarks Preservation Ordinance. The HPI prepared by HRA in 2007 for the residence found it to be ineligible for the NRHP and Washington Heritage Register because it is not associated with significant events or persons and is not an outstanding example of its architectural style or known to be the work of a master craftsman or architect. Built in 1908, this is a Craftsman-influenced, Colonial Revival-style, single-family dwelling. Initial development of the Mount Baker area occurred relatively late, post-1900, following the construction of the Rainier Avenue Electric Street Railway in the 1890s. The Mount Baker Park Addition represents the core of the neighborhood and is its primary character-defining feature.

Mount Baker Park is one of Seattle's earliest planned residential communities that successfully integrated the natural environment and a relatively exclusive residential neighborhood in its layout of lots, streets, boulevards, and parks. The houses, primarily built between 1905 and 1929, reflect a variety of eclectic and Northwest-based architectural styles, and include designs by many prominent local architects. Other important influences were the streetcar connection with downtown Seattle, the integration of local parks and boulevards into the Olmsted system, the construction of Franklin High School in 1912, and the building of the Mount Baker tunnel and Lacey V. Murrow Floating Bridge to Mercer Island in 1940. Today this middle-to-upper income neighborhood remains predominantly residential, is home to an ethnically diverse population, and retains much of its planned character.

The inventory of Segment A in the City of Mercer Island identified 13 properties, none of which are listed or eligible for the NRHP, WHR, or local register. The DAHP letter sent to FTA dated November 16, 2007 concurred with HRA's inventory of these properties and resultant determinations of eligibility for the NRHP.

7.3.2 Segment B

Survey efforts in the South Bellevue Segment B area inventoried 113 properties. One property, the Winters House, is on the NRHP, and another property, the Pilgrim Lutheran Church, is eligible for listing on the NRHP. The remaining properties were determined not eligible for the NRHP. All of the properties inventoried in Segment B were included in the 2007 version of the East Link Project Cultural Resources Technical Report. DAHP sent two letters to FTA (dated November 16, 2007, and February 20, 2008) regarding the inventory and determination of eligibility of Segment B properties and specifically noted that the Winters House at 2102 Bellevue Way SE was already listed in the NRHP, and the Pilgrim Lutheran Church at 10420 SE 11th Street is NRHP-eligible under Criteria C.

7.3.2.1 *Preferred Alternative B2M* and Alternatives B1, B2A, B2E, B3, and B3 - 114th Design Option

EXHIBIT 7-14
Winters House, 2102 Bellevue Way SE

The Winters House (Exhibit 7-14) was listed in the NRHP in 1992 under Criteria A and C, based on its Spanish Eclectic architecture and its association with developments in the bulb-growing and floriculture industry in King County and Washington State. The NRHP Registration form provides a boundary description that includes 50 feet of landscaping around the house, including a portion of the parcel along Bellevue Way. Frederick and Cecilia Winters purchased 10 acres of land along Mercer Slough in 1920, and 4 years later they purchased additional acreage to expand their business. During the late 1920s, a period of rapid growth for bulb farms in Washington, the family built the residence that remains on the property. Much of the surrounding land was then sold during the 1930s when it proved too swampy for growing bulbs, and the family sold the house in 1943. Historic photographs of the property depict its construction and the frequent changes made to the surrounding landscape throughout its evolution. The subsequent owners lived in the house until the 1980s, when the City of Bellevue acquired the house. The City of Bellevue restored the house during the 1990s, and it has since become the headquarters of the Bellevue Historical Society, which became the Eastside Heritage Center in 2001 when it merged with Marymoor Museum of Eastside History, in Redmond. The Winters House is currently used by the Eastside Heritage Center as a heritage research center, exhibit space, archive storage, library, and public meeting space. Additionally, the Eastside Heritage Center provides public and educational programming at the Winters House. The Winters House also contains office space for the City of Bellevue Parks and Community Service Department staff and can be used for public or private meeting event space. The Winters House is also part of the Heritage Loop Trail in Mercer Slough Nature Park the site includes historical interpretation and facilities for trail users.

The Winters House is prominently situated on the western edge of the Mercer Slough, a rich natural oasis in the midst of a substantial modern suburban community. The site of the house is bordered on the west by Bellevue Way SE, formerly a county road named Qualheim Road, which has been completely altered into a major arterial roadway and on the east by Mercer Slough. Oriented toward Bellevue Way, the former residence is set back approximately 50 feet and buffered from the roadway by a small grove of deciduous and conifer trees and shrubs. Originally a substantial lawn, fish pond, and planted area separated the residence from the formerly narrow roadway.

According to the 1991 NRHP Registration form, the house is the only intact historic property to remain on the site of the former nursery and bulb farm complex. While the house’s orientation to Bellevue Way at one time would have been a significant character-defining feature of the structure and its relationship to the surrounding landscape, the historic design of the roadway and its relationship to the house has lost its integrity. The NRHP Registration form notes that while the house presented a distinctive and formal entrance façade toward the once narrow road it faced, the floor plan and siting of the house were specifically oriented toward the view of the bulb fields below the house, to the rear, and the undeveloped eastern side of Mercer Slough. From windows and balconies on the rear elevation it commanded a complete view of the nursery complex and fields which facilitated its construction.

Courtesy of Eastside Heritage Center

Architectural historians reviewed the extant landscape and historic photographs to consider whether the landscape of the house is character-defining or includes any character-defining features from the historic period. In particular, HRA assessed the 50-foot boundary provided in the NRHP Registration form, which includes the set back of the residence from Bellevue Way. The NRHP Registration form includes the following boundary justification:

The nominated property includes the Winters House and the landscaped property within 50 feet of the house. While grounds within the surrounding and adjacent acreage are associated with the house, they are no longer cultivated and no intact outbuildings remain. However, the house does retain its setting and relationship to the surrounding property that is now Mercer Slough Nature Park. A large parking lot and trail access are also within the setting of the house.

Analysis of the 50-foot designated boundary to determine whether any character-defining landscape features currently remain that convey the significance of the residence and its relationship to the landscape found no such features. Rather, all of the surrounding landscaping was found to have been altered substantially from the historic period of the residence. Except for some mature trees beyond the rear of the residence that once were part of the larger property, the current landscape features do not in any way reflect the original landscape of the residence, nor do they convey the relationship of the landscape to the structure as it was first designed, matured, and allowed to evolve during the historic period of the property.

Architectural historians reviewed historic images of the Winters residence to further discern how the landscaping evolved and whether any character-defining significant original features of the residence are extant today. The earliest photograph reviewed from 1930 (Exhibit 7-15) depicts the residence when the landscape was just planted. Young cypress trees had been planted along the front elevation and a coniferous tree had also been planted against the front elevation.

A 1939 photograph (Exhibit 7-16) depicts how the cypress trees had grown as well as other shrubs planted along the front elevation, and the coniferous tree on the front elevation had grown to reach the roofline. On the opposite end of the elevation where the single-story garage was built, a deciduous tree had been planted and reached the roofline.

The third image of the house reviewed is of the residence in the 1940s (Exhibit 7-17), at which time the landscape had matured and included the cypress trees reaching the roofline, a variety of deciduous and coniferous trees along the front elevation, as well as shrubs and plants throughout the entire front lawn. Whereas the front lawn in 1930 appeared to be largely covered with grass, by 1939 the lawn had been planted with a variety of shrubs and other plantings and in the 1940s had matured.

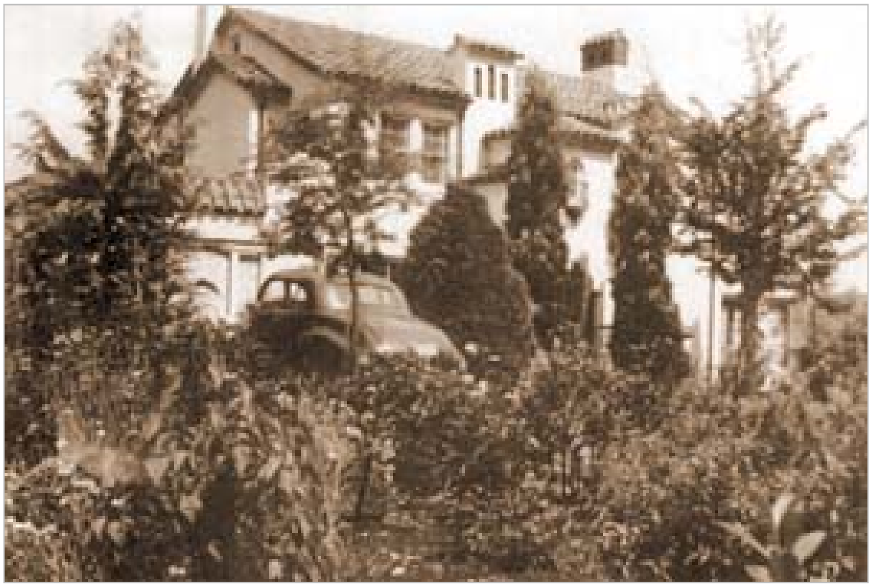

EXHIBIT 7-17
Winters House, 2102 Bellevue Way SE (1940s)
Courtesy of Eastside Heritage Center

Plantings from the period of significance have been removed. Currently the house consists of a landscaped lawn with a central concrete pathway featuring a center planting strip just opposite the entrance doors of the front elevation (Exhibit 7-18). All of the trees along the residence at the front elevation and side elevations appear to be plantings from after the period of significance, including relatively new deciduous trees and decorative shrubs. Although the landscaping in no way reflects the original landscaping, the residence itself remains intact and fully conveys its significance and period of construction and retains its relationship to the surrounding undeveloped land.

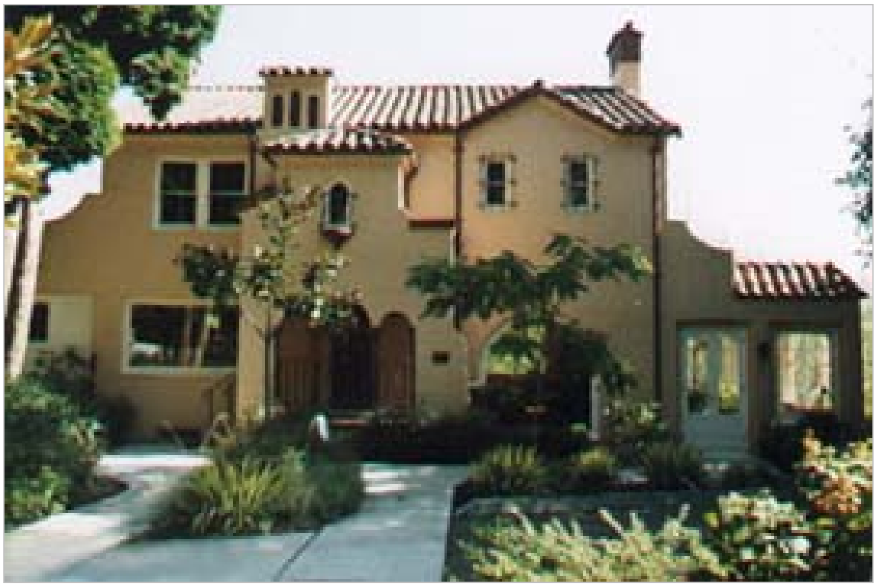

EXHIBIT 7-18
Winters House, 2102 Bellevue Way SE (Present)
Courtesy of Eastside Heritage Center

The NRHP Registration form describes the architectural style of the house, Spanish Eclectic, and the significance of this less common form of house design in the Pacific Northwest. The Winters House is unusual both for its style as well as its farmland setting, though the NRHP Registration form is careful to note that the landscape of the setting no longer has integrity to convey its significance. The rehabilitation and restoration of the residence in 1990 is also noted, and a Historic Structure Report was prepared to guide the project in accordance with the Secretary of the Interior's *Standards*. At the time of the nomination, future rehabilitation work was described as including selective restoration of the landscape, gardens, and bulb field areas by the City of Bellevue if proper funding could be obtained. As of the writing of this technical report, the Winters House landscape has not been restored and does not consist of features that are original or from the period of significance of the property.

The Winters House continues to fully convey its significance as outlined in its NRHP Registration form, though the 50-foot boundary provided around the house in the boundary justification does not signify that the landscaping is historic or character-defining. Rather, the presence of the undeveloped land around the residence is the historic context of the property, rather than what was actually planted around the residence, and the house retains its setting and relationship with the land. The relationship of the residence with and its orientation to Bellevue Way no longer has integrity, given the dramatic changes that have occurred to the once narrow country road that now is a major arterial leading to Downtown Bellevue.

7.3.2.2 Alternative B1

The Pilgrim Lutheran Church (Exhibit 7-19) within the Alternative B1 APE was completed in 1965. An outstanding example of Neo-Expressionist architectural style, the building is characterized by a geometric shingled roof that is both varied and dramatic. The roof forms a shed over most of the church and an angular cone rising to the steeple. Extending well beyond the building, the roof shelters brick walls, large windows, and walkways. The roofline also ties the church visually to the adjacent church hall. The design firm Grant, Copeland, Chervenak and Associates won awards for several of their local projects. The building is eligible for the NRHP under Criteria C and the WHR based on architectural excellence.

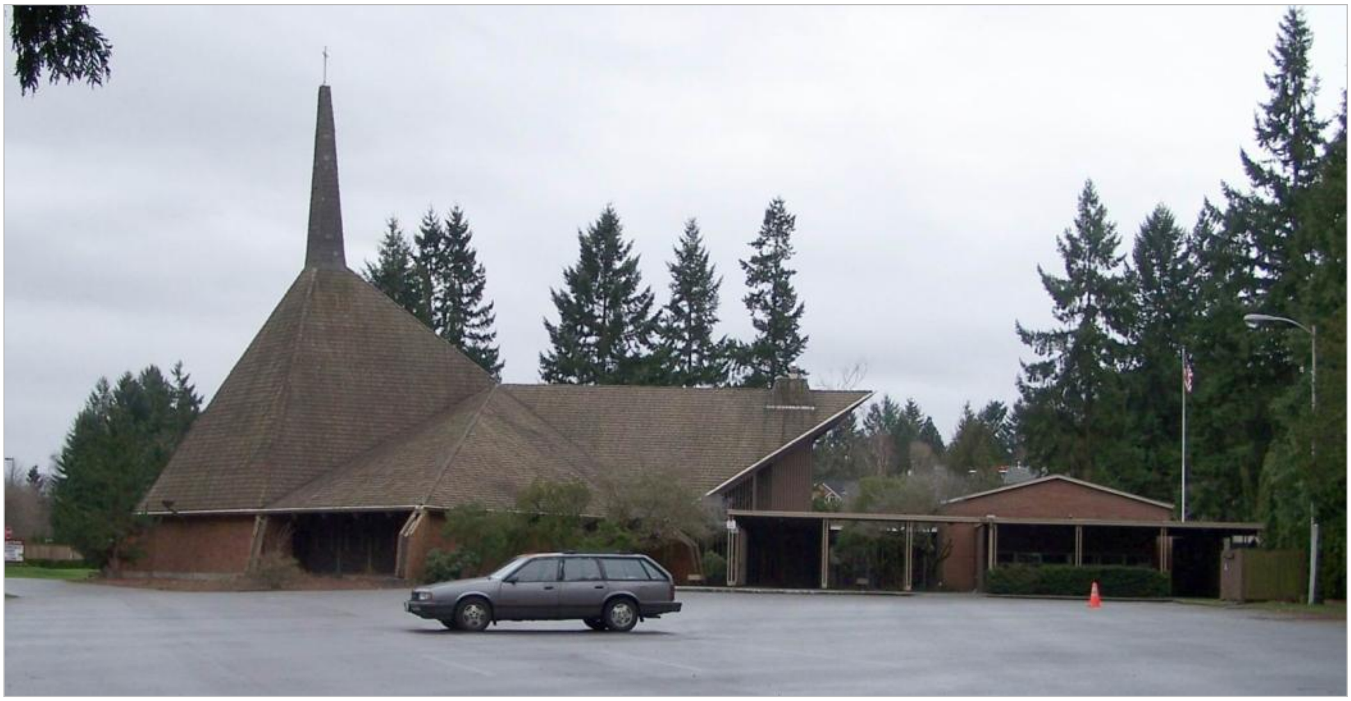

EXHIBIT 7-19
Pilgrim Lutheran Church, 10420 SE 11th Street

7.3.2.3 Alternative B7

No historic properties were recorded within the APE of Alternative B7.

7.3.3 Segment C

Survey efforts in the Downtown Bellevue Segment C area inventoried 203 properties, including one NRHP-eligible resource consisting of 37 contributing properties within the potentially eligible Surrey Downs historic district. All of the properties inventoried within the potential historic district (except for two residences on 109th Avenue SE surveyed in 2009) were included in the 2007 version of the Cultural Resources Technical Report for the 2008 Draft EIS. DAHP sent two letters to FTA (dated November 16, 2007, and February 20, 2008) regarding the inventory and determination of eligibility of Segment C properties and specifically noted that the Surrey Downs neighborhood is a potential historic district, exact boundaries of which have not been defined, eligible under Criteria A & C for NRHP listing. Project architectural historians have since updated the inventory of Surrey Downs to include two new residences, both found to be eligible for NRHP listing, and also further surveyed the Main Street end of the potential historic district to assess where contributing properties are located and the integrity of resources nearest to Main Street. The remaining properties inventoried within Segment C, including the First Baptist Church at 1100 Bellevue Way, were determined not eligible for listing in the NRHP.

7.3.3.1 *Preferred Alternatives* C11A and C9T and Alternatives C2T, C3T, C4A, C9A, C7E, C8E, C9A, and C14E

DAHP determined 37 houses would be contributing elements to a potential Surrey Downs historic district within the Segment C area of the project APE. Exhibit 7-20 shows where in the project vicinity project architectural historians inventoried properties and which of those properties are recommended as contributing properties. Exhibits 7-21 through 7-25 demonstrate representative examples of these residences. A district is a concentration of buildings or other properties that may or may not be individually eligible for the National Register but are linked by one or more features that define their character. To be considered eligible as part of the potential Surrey Downs historic district, the houses needed to fit one of the architectural styles discussed below and not have undergone substantial modification (on the exterior) since their construction. Project architectural historians researched the history of the subdivision, inventoried buildings in the APE, and recommended 37 as contributing properties. Table 7-2 summarizes information on the contributing properties, and Appendix C, Exhibit C-7, shows their locations within the APE. FTA determined, in consultation with DAHP, that no boundaries were to be established for the potential district because it extends beyond the project APE.

EXHIBIT 7-20
Contributing Properties for the potential Surrey Downs Historic District, Between 108th and 112th Avenues SE, South of Main Street

In May 2007, HRA architectural historians first prepared findings for Sound Transit regarding the potential historic district within the Surrey Downs residential subdivision. In May 2010, project historians revisited the analysis of the potential historic district in response to public comment to more thoroughly assess the integrity of extant resources in relation to the criteria established for the potential district. The result was the inclusion of two additional residences as eligible for NRHP listing, and confirmation and additional documentation supporting that determination that properties along Main Street at the north end of the historic district are not contributing.

EXHIBIT 7-21
West Side of 109th Avenue Showing Mithun & Nesland Designs in Potential Surrey Downs Historic District

EXHIBIT 7-22
Mithun & Nesland Design at 11022 SE 2nd Street in Potential Surrey Downs Historic District

Table 7-3 lists properties that are currently considered to be contributing to the potential historic district:

Houses in Surrey Downs that retain integrity are likely to be eligible for the NRHP as a historic district because they are part of a residential subdivision developed during the period 1952-1956; many of the houses represent a Pacific Northwest regional variant of the Modern architectural design style of post-World War II residential architecture; a number of the houses are based on the designs of a prominent Seattle architectural firm Mithun & Nesland (now Mithun Partners); and the neighborhood retains a high degree of design unity and cohesiveness.

In 1952, Roxbury Homes purchased 80 acres that had been a filbert farm just south of Bellevue's downtown. The area was platted as "Surrey Downs Addition No. 1" in May of that year. The plat was bounded by Main Street on the north, 112th Avenue SE on the east, SE 2nd Street on the south, and 108th Avenue SE on the west. Roxbury Homes constructed the Surrey Downs residential subdivision, which eventually included about 200 houses. Between 1954 and 1956, they built approximately 40 of the houses using designs purchased from the Mithun & Nesland architectural firm. Although the owners have altered many of these houses—some substantially—since then, the neighborhood retains an unusual degree of design quality and cohesiveness.

Roxbury Homes constructed the subdivision in two stages, platted as Surrey Downs No. 1 and No. 2. For the first stage, the company purchased a few designs from Mithun & Nesland and adapted them to the varied topography of the subdivision, making aesthetic changes so that the houses built from the same design would not be identical. These Northwest Modern style designs (18 houses) included one-story houses with carports and two-story houses with garages located beneath the living space. Some of the one-story house designs featured a pitched roof that evoked a front-gabled house, with the house located under one pitch and the carport under the other. In other cases, the house extended under both sides of the roof, while the carport roof extended into the driveway. Some of the two-story houses showed a similar front-gabled appearance, while others had flat or nearly flat roofs. Other contributing houses include split-level (11 houses) and ranch styles (8 houses).

Properties that contribute to the potential historic district feature open plans, large areas of glass, and extensive use of wood. Hardwood floor and exposed beams characterize the house interiors, while the exteriors show wood siding, exposed rafters, and wooden roof supports. Skylights supplement the windows, which are plentiful and large, maximizing the amount of light admitted. Roxbury Homes chose pleasing color combinations, allowed wood grains to show through treatments, and left many of the existing trees on the lots. All of these factors contribute to the unity of design and quality that distinguishes this portion of the subdivision.

A report and map prepared by University of Washington student Russell L. Leach in 1965 regarding Surrey Downs and its Mithun & Nesland Mid-Century Modern homes was reviewed in preparation of the May 2007 and May 2010 inventory and evaluation efforts. The map accompanying the report was drawn by Leach to represent the original Mithun & Nesland-designed homes, as told to Leach through an interview with Omer Mithun prior to the completion of his report in 1965. In reviewing Leach's report, project architectural historians determined there was a need for a new survey of the neighborhood to determine which of the homes identified by Leach as architect-designed were in fact representative of the Mithun & Nesland-designed residences, and which of those retained integrity and were thus eligible as contributing properties to the potential historic district. The architectural historians also surveyed properties to identify whether they were individually eligible for the NRHP.

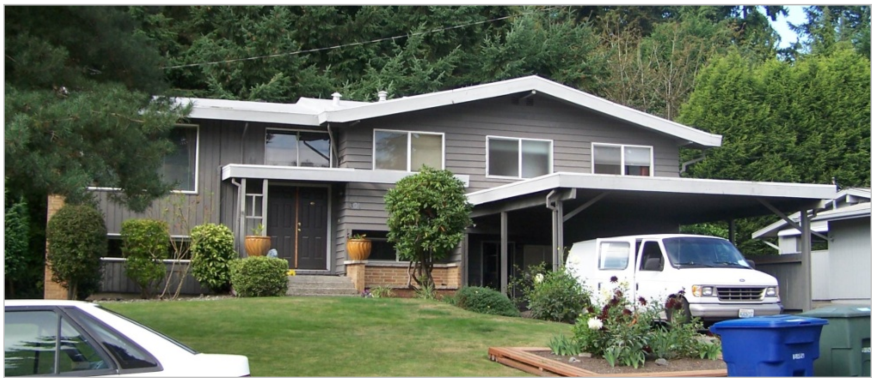

EXHIBIT 7-24
Split-Level Style at 301 109th Avenue SE in Potential Surrey Downs Historic District

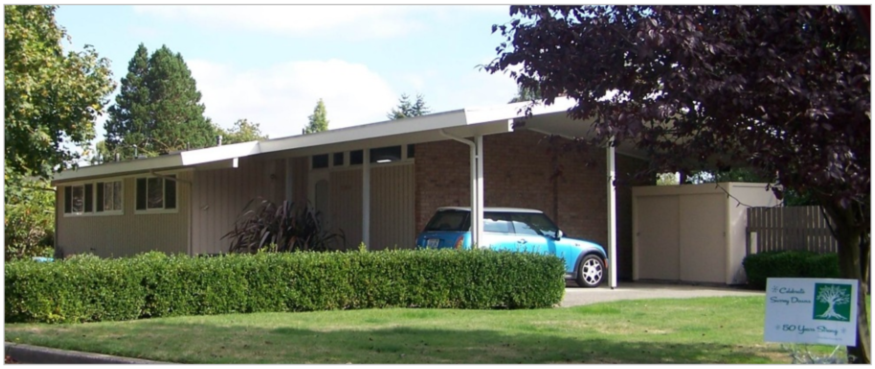

EXHIBIT 7-25
Ranch Style at 204 110th Place SE in Potential Surrey Downs Historic District

As the Leach report suggests that Mithun & Nesland designed the Surrey Downs neighborhood, the review of the potential historic district and properties within have largely been based on determining which of the residences extant in the neighborhood reflect one of the three designs sold to Roxbury Homes by the firm. The research found that Roxbury Homes sought to keep residences within the neighborhood from becoming too uniform, and toward that end, the developer altered

[a] Mithun & Nesland, Architects

aspects of the three designs bought from the architectural firm in the actual construction of the residences. Further research into the use of the Mithun & Nesland designs by the developer should be conducted if and when the potential historic district is more fully reviewed and nominated for listing in the NRHP.

While the Leach report provides good supportive evidence for the current review of Surrey Downs properties, recent data and a firsthand interview conducted by a project architectural historian with a member of the current Mithun firm have revealed further information and have clarified the role of the firm in the neighborhood. Mithun expressed specifically that the firm sold Roxbury Homes three designs and has no record of where in the subdivision those designs were used. No one at Mithun or in the archives used in the research expressed that everything in Surrey Downs was based on Mithun & Nesland designs, but rather that a survey of the properties would be necessary to determine which properties reflect the Mithun & Nesland firm and which of those retain integrity. It was also expressed that while designs were by Mithun & Nesland, the developer Roxbury Homes adapted the designs to ensure there would not be an overwhelming sense of uniformity among the residences.

Whereas many of the residences within the Surrey Downs subdivision constitute a potential historic district, particularly those based on Mithun & Nesland designs, other houses located south and east of the Mithun & Nesland residences within the subdivision are similar in architectural style but “lack the unity and quality of those designed by Mithun & Nesland.”

Other properties considered to be noncontributing properties to the potential Surrey Downs historic district include structures located along the northern boundary of the subdivision, Main Street. These structures include highly altered residences, residences that are original to the subdivision but unrelated to Mithun & Nesland designs, former residences that have been altered for commercial uses, and nonresidential commercial structures.

One such property is 10845 Main Street (alternate address 69 110th Ave SE) (Exhibit 7-26), a former residence on the northern boundary of the neighborhood built in 1954 when Mithun & Nesland designed-residences were built within Surrey Downs. The property faces Main Street and yet was originally accessed by a driveway on 110th Ave SE. The alternate address for this property is 10845 Main Street. Currently operated by the Semenea Law Firm, the one-story side-gabled structure includes a plan consistent with the houses in the Surrey Downs subdivision. The clerestory windows in the gable end of the former residence are original, but other windows have been replaced. Other character-defining features include the low-sloping, dramatic side-gabled roof and materials and the red brick double-wide chimney, as well as wood siding. Current analysis finds that the building appears related to the three known Mithun & Nesland designs sold for use by Roxbury Homes, and yet the building has undergone significant alterations to its west (rear) elevation and a surface parking lot has been added along its north elevation due to its conversion for commercial use. Changes to windows and the setting of the building also detract from its overall integrity and relationship to the residences within Surrey Downs.

The altered former residence at 10845 Main Street was not considered in isolation but rather in the context of the potential historic district and other contributing and noncontributing properties. This and other properties facing Main Street and within proximity of the major roadway have undergone similar alterations and a change in context over the years and do not reflect the type of typical residential alterations that residences further within Surrey Downs have undergone.

Other Main Street properties surveyed include 10833 Main Street, a parking lot created to serve an adjacent commercial structure to the west. These properties (Exhibit 7-27) are not architecturally or historically related to the development of Surrey Downs. Though it is unknown when the property at 10833 Main Street was demolished to create the parking lot, and the assessor record was not updated as of March 19, 2010, it is known that these properties and the former residence to the east, 10845 Main Street, are not properties that contribute to the potential historic district.

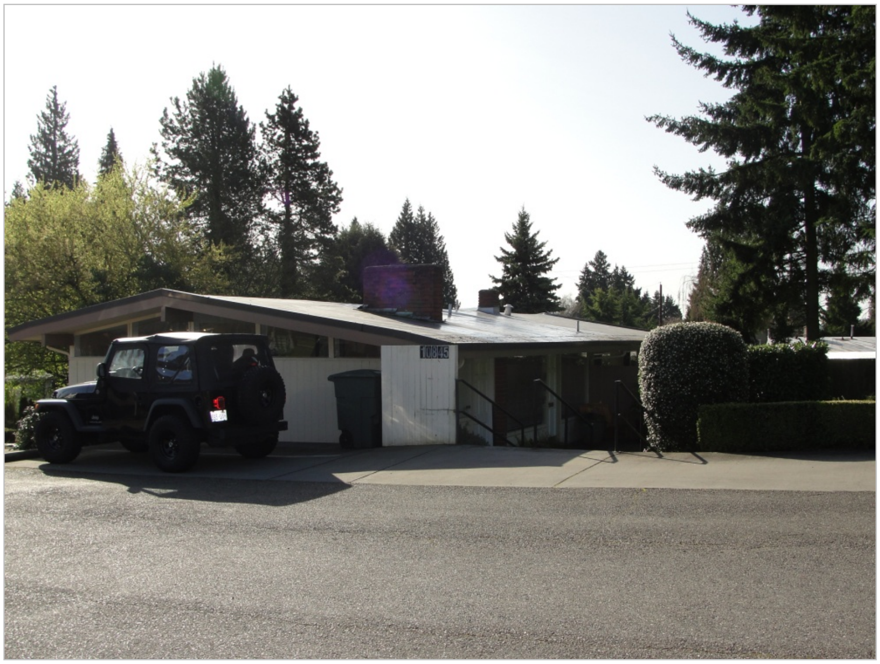

EXHIBIT 7-26
10845 Main Street (Alternate Address 69 110th Avenue SE)

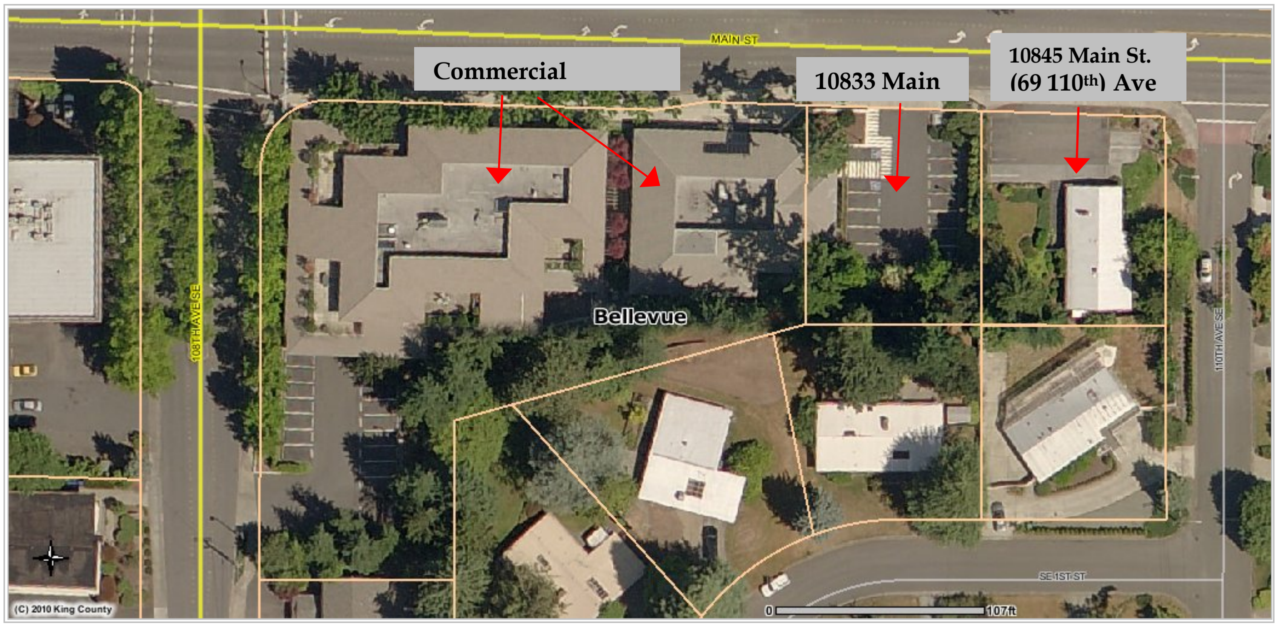

EXHIBIT 7-27
Main Street Properties

The structure at 11005 Main Street (Exhibit 7-28), opposite the former residence at 10845 Main Street and across 110th Avenue SE, is operated by the Law Offices of Fitch & Ludwick and is opposite a Toys R Us retail store and other commercial developments.

EXHIBIT 7-28
11005 Main Street

South of 11005 Main Street is 80 110th Avenue SE (Exhibit 7-29), identified as the “Kim Residence,” along with the neighboring property to the south at 88 110th Avenue SE. Whereas both 80 and 88 110th Avenue SE residences were built in 1954, the two buildings are architecturally different. The residence at 80 110th Ave SE is a one-story residence with a side-gabled roof. It has an attached garage with a hipped roof. The cladding of both is clapboard. The architectural style is Minimal Traditional. According to the archived King County tax records, the owners enclosed the carport to create a garage in 1960 and altered the roof and some other elements in 1972 after a fire damaged the building. Although the building was found to have integrity of location, setting, workmanship, feeling, and association, changes to the house impair the integrity of design and materials. There is no known association between the building and significant events or lives of significant persons and it is not known to be the work of a master craftsman and or architect. It is also not an outstanding example of an architectural style or building type. While the building was built in 1954, the same year the residence directly to its south (88 110th Avenue SE) was built and designed by Mithun & Nesland, this residence does not portray any of the design qualities determined to be significant within the potential Surrey Downs historic district and in its design does not appear to be related to the significant work by the architectural firm within the neighborhood. The lack of integrity of the residence due to changes to its original 1954 features furthers the determination that this residence is not a contributor to the potential historic district.

EXHIBIT 7-29
80 110th Avenue SE

The residence at 88 110th Avenue SE (Exhibit 7-30), the third structure along 110th Avenue SE from Main Street, is one-story with a front-gabled roof. There are clerestory windows under the eaves. While owners have made changes to the residence since it was designed and built in 1954, the major design elements are intact. The windows appear original, as do the plan, roof structure and materials, brick chimney, and siding. These character-defining features of the residence are in keeping with other significant contributing residences within the potential historic district that can be attributed to the work of the architectural firm Mithun & Nesland.

EXHIBIT 7-30
88 110th Avenue SE

The residence at 79 110th Avenue SE (Exhibit 7-31), directly south of 10845 Main Street and opposite 80 and 88 110th Avenue SE, was noted by Leach in 1965 as a Mithun & Nesland designed residence, and yet upon inventory was found to be a noncontributor to the potential historic district due to its loss of integrity through extensive alterations.

7.3.3.2 Alternative C1T

One historic property was found within the APE for Alternative C1T, a former Safeway store (Exhibit 7-32) located at 414, 424, and 456 104th Avenue NE. FTA has determined, in consultation with SHPO, that this structure is eligible to the NRHP. Constructed in 1962, the building likely originally served as a grocery store, and resembles other grocery stores constructed by the Safeway Corporation in the 1960s. According to National Register Criterion C, a building is eligible for the NRHP as a specimen of its type or period of construction and if it is an important example of building practices of a particular time in history. The former Safeway store embodies the distinctive characteristics of a type and period of construction in its representation of a large-scale commercial grocery store of the 1960s.

EXHIBIT 7-31
79 110th Avenue SE

The historic context of this building is the big-box style commercial development of the 1960s and the role commercial retailers and particularly supermarkets had in suburban expansion. While the Safeway store is eligible for the NRHP under Criterion C due to its distinguishing characteristics of its type and period of construction, the building does not appear to be associated with events that made a significant contribution to the broad patterns of local, state, or national history and is not recommended eligible for listing under Criterion A. The building also does not appear eligible under Criterion B, as it is not known to be associated with the lives of significant people. Furthermore the building is unlikely to yield further information important in understanding local, regional, or national history, and is recommended ineligible under Criterion D. The building maintains good integrity of materials, design, workmanship, feeling, association, location, and setting. The store is currently closed and a preliminary land use plan application for new construction is posted on the property.

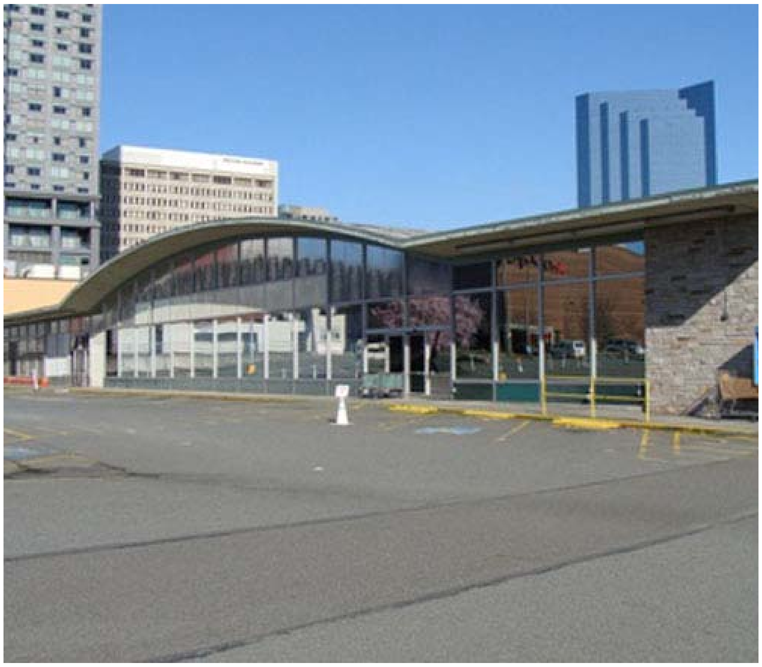

EXHIBIT 7-32
Safeway Store

7.3.4 Segment D

Survey efforts in the Bel-Red/Overlake Segment D area inventoried 27 properties, including the NRHP-eligible Former Bellevue Fire Station. All of the properties inventoried in Segment D were included in the 2007 Cultural Resources Technical Report for the 2008 Draft EIS. DAHP sent two letters to FTA (dated November 16, 2007, and February 20, 2008) regarding the inventory and determination of eligibility of Segment D properties and specifically noted that the Bellevue Fire Station is eligible for NRHP listing under Criteria A and C. The remaining properties surveyed in Segment D, including the Highland Covenant Church at 15022 NE Bellevue-Redmond Road, were determined to be ineligible for NRHP listing.

7.3.4.1 *Preferred Alternative D2A* and Alternatives D2E and Alternative D5

No historic properties were recorded within the APE of these alternatives.

7.3.4.2 Alternative D3

Within the Alternative D3 APE, the former Bellevue Fire Station (Exhibit 7-33) on Bellevue-Redmond Road, constructed in 1960, is eligible for the National Register under Criteria C as a good example of Populuxe architecture. The nearly flat roof has eaves with a wide overhang. The roof silhouette, which widens at the center, gives the impression that the roof curves upward at the outer edges. The style is reminiscent of 1950s aerodynamic styling. The building is currently used for the City of Bellevue's vehicle storage. Although the building's parcel is situated inside the APE, the building itself is outside the APE.

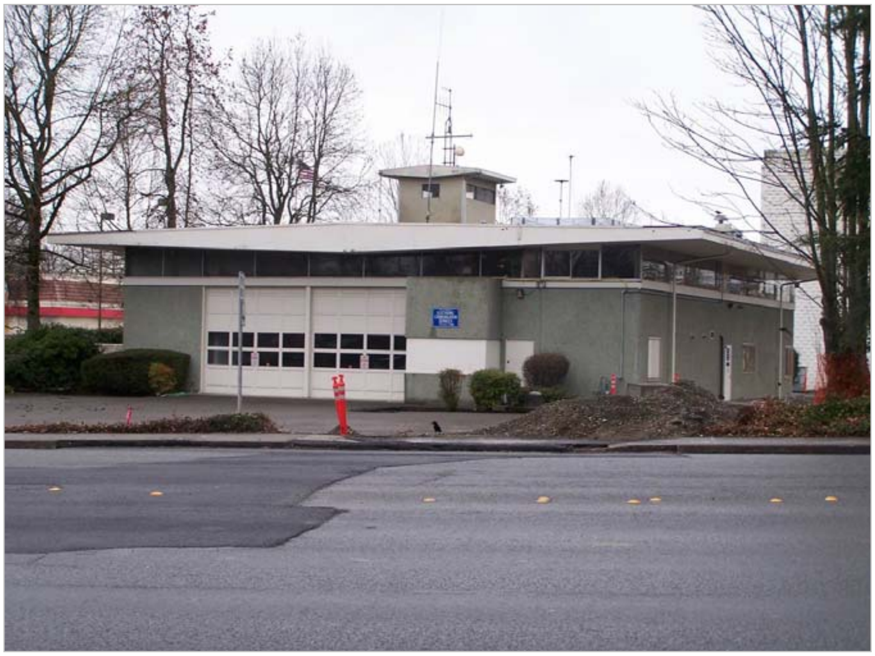

EXHIBIT 7-33
Former Bellevue Fire Station, 14822 NE Bellevue-Redmond Road

7.3.5 Segment E

Survey efforts in the Downtown Redmond Segment E area inventoried 33 properties, including the NRHP-eligible Justice William White House and the Bill Brown Saloon Building. The Justice William White House and the Bill Brown Saloon Building are designated as Redmond Heritage Landmarks. Architectural historians recommended the two Redmond Heritage Landmarks as eligible for listing in the NRHP (and therefore also for the WHR). SHPO concurred with the recommendations. All of the properties inventoried in Segment E were included in the 2007 Cultural Resources Technical Report for the 2008 Draft EIS. DAHP sent two letters to FTA (dated November 16, 2007, and February 20, 2008) regarding the inventory and determination of eligibility of Segment E properties and specifically noted that the Justice White House/Hotel Redmond on Leary Way is formally determined eligible for NRHP listing by the Keeper but not listed due to owner objection and is also not listed on the WHR, and that the Bill Brown Building at 7824 Leary Way NE is eligible for listing in the NRHP under Criteria B. The remaining properties surveyed in Segment E, including the Haida House on Sammamish Parkway (Exhibit 7-34), were determined to be ineligible for NRHP listing.

EXHIBIT 7-34
Haida House on Sammamish Parkway

EXHIBIT 7-35
Justice William White House, Leary Way NE and NE 76th Street

The Justice William White House (Exhibit 7-35) is significant under Criteria B and C, because its owners, William and Emma White, both played important roles in the history of Redmond and western Washington and the building retains integrity and is one of the few, if not the only, remaining example of Queen Anne Shingle style architecture in Redmond. William White moved to Seattle from West Virginia in 1870. He served as prosecuting attorney of the Third Judicial District, represented King County in the Territorial Legislature, and then served as United States attorney for the territory until statehood in 1889. In 1890, the governor appointed White to the Washington State Supreme Court. In 1898, White married Emma McRedmond, daughter of one of Redmond's founders and its namesake, Luke McRedmond. Emma McRedmond served as the town's postmistress for many years, beginning when she was 16. She was among the first women to run for statewide office and organized the Women's Democratic Club. In 1900, Emma and William White moved into the 14-room house that they built on a portion of Luke McRedmond's original claim. They set aside a part of the house as a hotel because it was conveniently located close to the railroad line and the passenger depot, giving guests easy access. Justice White died in 1914, and the family lost the house to foreclosure in 1932. It then became the clubhouse for a golf course located south of the house (Hanscom, 1979). The golf course has since become the site of the Redmond Town Center shopping center, and an architecture firm occupies the house.

The Redmond Trading Company building (which is currently occupied by Half Priced Books) was built in 1910 to house the store that was Redmond's largest business for decades during the City's earliest period of development. The Redmond Trading Company engaged in selling "general merchandise" both wholesale and retail. Fred Reil, Redmond's first mayor and an early postmaster, was one of the original owners and the building originally housed both the store and the post office. Through the ownership changed over time, the Redmond Trading Company operated at this location until 1955. Since then, the building has housed several different businesses. The building was originally constructed with a wooden cornice, multi-light transom windows, wooden storefronts and two double entries. None of this fabric remains, nor do any of the spatial relationships created by this façade. The presence of the display windows along the Leary Way side of the building is the only characteristic that the present façade of this building shares with the original, and as a result it is not considered eligible for listing in the National or State Registers. However, this building is a Redmond Heritage Landmark since it is considered an important early reminder of the City's early commercial development.

The Bill Brown Saloon Building (Exhibit 7-36) is significant under Criteria B because of its association with the man who was mayor of Redmond from 1919 to 1948. The building, while not an outstanding example of an architectural style, is the work of a master craftsman. Beginning well before he became mayor, Brown operated a variety of businesses. In 1910, he constructed his first building at Leary Way and Cleveland Street, a wood-frame structure that housed his saloon. Brown tore it down 3 years later and constructed the brick building that stands on the corner today. When it opened, the building housed the saloon, a drugstore, and a barbershop, with an upstairs gathering space for community events. When prohibition closed the saloon, Brown explored other businesses, including an auto stage line and a logging company. Beginning about 1915, the building's second floor served as an unofficial Redmond City Hall (Hardy, 2001).

The Dudley Carter/Haida House is a City of Redmond historic landmark, and the City considers it to be eligible for listing in the National Register. It was constructed by nationally known, Canadian-born artist Dudley Carter following methods of the Haida First Nation. However, based on a November 16, 2007, finding by DAHP regarding eligibility of resources in the project APE, the Haida House did not meet the eligibility requirements for the National Register.

7.3.6 Maintenance Facility Surroundings

No historic properties have been recorded at the alternative maintenance facilities.

EXHIBIT 7-36
Bill Brown Saloon Building, 7824 Leary Way NE

8.0 Environmental Effects

Project operation and construction could impact historic properties directly or indirectly. The Criteria of Adverse Effect, which determine if there will be an impact, are discussed in Section 3.6 above. The Advisory Council on Historic Preservation's regulations implementing Section 106 of the National Historic Preservation Act (36 CFR Part 800) create a process by which federally assisted projects are reviewed for their impacts on properties listed in, or eligible for listing in, the NRHP.

After a historic property is identified, the next step is applying the Criteria for Adverse Effect. These criteria are used to determine whether the undertaking could change the characteristics that qualify the property for NRHP eligibility. An impact is found when an undertaking may alter, directly or indirectly, any of the characteristics of a historic property that qualify the property for inclusion in the National Register in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association. Impacts include, but are not limited to, the following:

- Demolition or alteration of the property
- Alteration of the property's setting
- Introduction of visual, audible, or atmospheric elements that are out of character with the setting of the historic property
- Physical encroachment upon an archaeological site

Direct impacts are those caused by the project while the project is under construction or operating while indirect impacts are those reasonably foreseeable impacts caused by the action at a later time or at a distance that is farther removed from the project location, in accordance with 40 CFR 1508.8. The following sections discuss the potential impacts of project operation and construction on archaeological sites, TCPs, and historic buildings and structures by resource type for each segment.

Pursuant to 36CFR Part 800.5(b), an agency may propose a finding of no adverse effect in consultation with the SHPO when the undertaking is modified or conditions are imposed to avoid impacts. Potential impacts could occur at three historic resources, depending on the alternatives selected: the Justice White House with Alternative E4, the potential Surrey Downs historic district during construction of *Preferred Alternative C11A* or Alternatives C2T, C3T, orC4A and the Winters House during the construction of *Preferred Alternative B2M*. With the exception of the three resources and alternatives discussed above, in all instances where the project alternatives would affect a resource, impact minimization measures have been included in the project that would prevent an impact.

For all other historic resources and project alternatives, project historians did not find potential impacts from East Link Alternatives. These resources include the following: the I-90 Lake Washington Highway Segment and Mount Baker Ridge Tunnels, Will H. Thompson House, Jose Rizal 12th Avenue South Bridge, Immigrant Station and Assay House, Publix Hotel, Endersen Residence, Romaine Electric/Washington Iron Works Pattern Shop, Pilgrim Lutheran Church, Bill Brown Saloon, and the Dudley Carter/Haida House.

Following the release of the Draft EIS for public comment, the City of Bellevue requested that Sound Transit consider an alternative that traveled on the east side of Bellevue Way. This suggestion was also reiterated in numerous public comments that requested the alternative be furthest away from residences in order to minimize their perception of impacts on the adjacent neighborhoods. Further, to avoid intrusion on the Winters House and reduce concerns over visual impacts, the alternative was lowered below ground in front of the Winters House to preserve the existing contextual setting as much as possible. The alternative was selected as the *Preferred Alternative* by the Sound Transit Board as titled *Preferred 112th SE Modified Alternative (B2M).*

The No Build Alternative would not impact any historic properties.

8.1 Archaeological Sites

8.1.1 Description

Project archaeologists recorded two historic-period archaeological sites in the APE of the Preferred Alternative. Site 1256-1, along *Preferred Alternative B2M* and Alternatives B2A, B2E, and B3, is not eligible for listing in the NRHP: its integrity has been compromised, and it does not meet any of the four criteria that define eligibility.

A newly-recorded segment of site 45KI451, the SLS&E Railway, is also recommended not eligible for listing in the NRHP. Although substantial portions of the grade retain integrity of location, materials, and design, the growth of Redmond and the demolition of the Redmond Depot have decreased its integrity of setting, feeling, and association. The resource is not eligible under any of the four criteria for listing.

The single previously recorded prehistoric site (45KI8) could not be verified during the 2007 archaeological survey. The location of the many portions of the project within areas not considered sensitive for the occurrence of archaeological sites or in high-sensitivity areas that have received previous disturbance makes it unlikely, although not impossible, that the project would impact NRHP-eligible archaeological sites.

It is possible that one or more archaeological sites may exist beneath the ground surface in areas where project excavation would take place. The Segment B and E alternatives are more sensitive for containing archaeological sites than the other segments. *Preferred Alternative B2M* and Alternatives B2A, B2E, B3, and B7 are near Mercer Slough and its adjacent terraces; *Preferred Alternative E2* and Alternatives E4 and E1 are near the Sammamish River valley and its adjacent terraces. In Segment C, archaeological deposits are typically shallow (in the top meter or less below the ground surface). Recent explorations have not shown presence of native soils that would contain any deposits. However, since the ground has been previously disturbed in this area and native soils have been buried by historic-era fill episodes, archaeological sites may exist at depths that would be disturbed by tunnel excavation.

8.1.2 Effects During Operation and Construction

Project archaeologists will conduct additional subsurface testing before construction— activities referred to as Stage 2 survey in Section 3.3. Stage 2 survey tracts are those outside of public ownership, or were paved or otherwise less accessible at the time of Stage 1 survey prior to FEIS preparation. Stage 2 surveys will be conducted and use information from the Stage 1 survey and geotechnical borings, and will occur once the properties have been acquired by Sound Transit, after completion of the Final EIS. Stage 2 surveys will take into account that the location of archeological sites may have shifted due to previous historic period ground disturbance activities. Information gathered from the Stage 2 survey will inform preparation of the Archaeological Resources Monitoring and Treatment Plan (ARMTP) or an Unanticipated Discoveries Plan (UDP), which will guide archaeological monitoring work during East Link Project construction. FTA and Sound Transit will coordinate with SHPO, interested tribes, and other interested parties as appropriate, to review the plan.

8.2 Traditional Cultural Properties

Consultation with the tribes has identified no information regarding traditional cultural properties that would be impacted by the East Link Project.

8.3 Historic Buildings and Structures

8.3.1 Effects During Operation

This section evaluates anticipated operation impacts on historic properties identified within the project alternatives' APE, beginning with the discussion of the potential impacts for the *Preferred Alternative* for each segment.

8.3.1.1 Segment A

Operation of the light rail system on Alternative A1 is not anticipated to impact the seven historic properties identified in Segment A because of the position of Alternative A1 in the center of I-90.

The Publix Hotel

The Publix Hotel would not be impacted by Alternative A1, which begins with the addition of the project to the Downtown Seattle Transit Tunnel. The building is across the street to the east from the International District Station entrance to the transit tunnel, and the project would not result in above-ground changes in the immediate vicinity. There would be no impact on the setting of the property and no direct impacts on the structure from vibration, given the distance of the project from the historic property.

The INS Building

The INS Building is situated at the east edge of the APE, and considerable traffic associated with the 5th Avenue S/I-90 ramp is already present. The light rail facility would be at the level of the transit tunnel and then under Airport Way, and would not be visible until south of Airport Way when it transitions to at-grade to enter the existing D2 Roadway right-of-way. The project would not impact the setting of the building or the structure itself, because it would be below grade on an existing transportation structure, and consistent in general appearance with the buses using the D2 Roadway.

The Washington Iron Works Pattern Shop

Due to the location of the project alternative in the existing D2 Roadway right-of-way and the project's consistency with the transit function and appearance of this facility, operation of the project would not impact the Washington Iron Works Pattern Shop structure or setting, nor would it have vibration or other impacts on the structure.

12th Avenue South Bridge

The operation of the project along I-90 at-grade beneath the 12th Avenue South Bridge would not impact the setting of the bridge because the project is within the boundaries of the existing I-90 roadway.

Will H. Thompson House

The Will H. Thompson House sits above the Mount Baker Ridge Tunnels, where the light rail would run. The project is anticipated to have no vibration or other impacts on the Will H. Thompson House.

1402 32nd Ave South

Due to the distance of the project alternative from the residence at 1402 32nd Avenue South and the project's location in a tunnel within the existing I-90 right-of-way, operation of the project along I-90 at-grade would not impact the setting of the residence, nor would it have vibration or other impacts on the structure and its character-defining features.

I-90 Lake Washington Segment and the Mount Baker Ridge Tunnels

Preferred Alternative A1 would use the I-90 center roadway for the light rail trackway (Exhibit 8-1) and include a station in the center of I-90 between Rainier Avenue and 23rd Avenue with entrances from 23rd Avenue S and Rainer Avenue S, and a station with the existing park-and-ride garage on Mercer Island between 77th and 80th avenues SE and station entrances on 77th Avenue SE and 80th Avenue SE. The conversion of the center roadway to light rail would require closure of the westbound 77th Avenue SE off-ramp and the eastbound direct high-occupancy vehicle (HOV) off-ramp to Island Crest Way. The project includes an option to connect the outer HOV lane from I-90 east bound to the Island Crest Way ramp. Both the

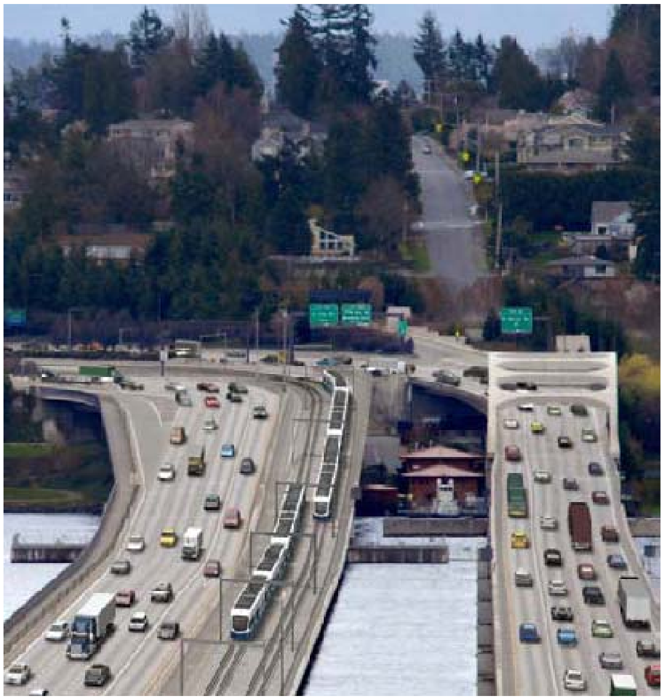

EXHIBIT 8-1
I-90 Floating Bridges with Light Rail Visual Simulation

I-90 tunnels and the floating bridge would require modifications to incorporate light rail. Modifications would include changes to wall dividers, a catenary system, light rail tracks, drainage, and ventilation. To equalize weight on the bridge from installation of steel rail, the concrete surface may be made thinner by removing the upper layers. Finally, to accommodate movement of the floating bridge in relation to the land abutment, specialized rail expansion joints would be installed on the bridge.

This segment of I-90 is unique in including both highway and transit elements in its earliest planning stages, unlike most of the national interstate system. In applying the Criteria of Adverse Effect, it has been concluded that that there would not be an impact on the historic property and its character-defining features because of its original design to accommodate high capacity transit, including light rail, and the placement of light rail within the existing right-of-way in the center roadway, which maintains character-defining features of the floating bridges, tunnel portals, and lids. The project would be constructed within the facility's existing center roadway and would not require widening of the facility. Structural modifications would not be noticeable. Modifications would not affect location, design, setting, materials, workmanship, feeling, or association of the I-90 corridor that make it eligible for the National Register. The project would not change the innovative engineering or amenities, such as the floating bridges, Mount Baker Tunnels, and landscaped lids. The project fulfills part of the original intention for use of the center roadway for transit. The primary changes to the transportation facility do not affect the character or the intended use of the structure.

8.3.1.2 Segment B

There are two historic properties within the APE of the Segment B alternatives. The Winters House is within the APE of *Preferred Alternative B2M* and Alternatives B1, B2A, B2E, and B3. The Pilgrim Lutheran Church is within the APE of Alternative B1. There are no historic properties within the APE of Alternative B7.

Winters House

The Winters House is within the APE of all Segment B alternatives except Alternative B7. None of the Segment B alternatives would have an impact on the property during operation. The following discusses each alternative within proximity of the Winters House.

Effects of *Preferred Alternative B2M*
All measures to minimize potential operational period impacts to the Winters House are incorporated in project design. The alignment of *Preferred Alternative B2M* is proposed to be located within the 50-foot boundary of the Winters House established in the NRHP nomination. *Preferred Alternative B2M* would run in a lidded retained-cut positioned approximately 9 feet from the building foundation and 4.5 feet from the front porch (Exhibits 8-2and 8-3). The 170-foot-long retained cut would extend north and south of the house the full width of the 50-foot boundary, but because the light rail project would be below grade, the light rail and retained cut would not be visible within the property boundary. Exhibit 8-4 depicts a bird's eye view of the existing condition and the property with *Preferred Alternative B2M.*

The light rail would change elements that do not contribute to the Winters House eligibility. For example, the light rail would displace the existing landscaping in front of the house. While the landscaping is mature, historic photographs and discussions with the Eastside Heritage Center, which

currently uses the building as an office and community meeting room, have verified that the landscaping is not part of the historic context. As part of the landscape plan, the existing concrete walkway from the parking lot to the basement would be reconfigured to a combination of stairs and a winding 6-foot wide ramp, which would provide handicap accessibility between the house and the parking lot in compliance with the Americans with Disabilities Act of 1990. Additionally, the front sidewalk would be moved 5 feet into the front yard, towards the house, which will allow for a row of trees to be placed between the sidewalk and the Bellevue Way (Exhibits 8-3 and 8-4). Although they are within the 50-foot boundary, the existing concrete walkway and sidewalk are also not part of the historic context of this resource. The Winters House also includes a garage, which is no longer functional, and vehicular access to the garage and front door would not be maintained with the lidded trench. Vehicles would only be allowed access to the basement.

Furthermore, the 50-foot boundary around the house provided in the NRHP boundary justification has already been reduced on the west side due to widening of Bellevue Way SE and thus has lost integrity. While the presence of land surrounding the house has been a feature of the property since it was constructed, the setting of the residence as it relates to Bellevue Way is not a character-defining feature given this loss of integrity. Therefore, any removal or addition of plantings would not be an impact on the historic property. A Sound Transit landscape architect has prepared a conceptual landscape plan showing what might be planted above the lidded retained cut, which would be more consistent with the landscaping typical of this historic-period landscaping as shown in Exhibit 8-5. The conceptual design can be found in Appendix D1. Sound Transit would preserve, as practical, historic period plants that would be impacted by project construction such as the Ostbo rhododendrons. Final design of the landscaping would be developed in consultation with the City of Bellevue.

Although the front landscaping within the 50-foot boundary does not convey significance and is not character-defining, the house does retain its relationship to the larger surrounding property to the north, south, and east of the house. However, given that the setting has changed from a working nursery and bulb farm to the current Mercer Slough Natural Park, a large 320-acre park that contains the area associated with the original Winters House farm and beyond, the setting adjacent and behind the house is not impacted.

In addition to landscaping the property consistent with the historic-period landscape, Sound Transit would provide interpretive signage on or near the property of the house. The project would also require shifting the driveway to the Winters House parking lot, which is not original, approximately 90 feet north, with a lid over the light rail retained cut to allow automobiles to cross into the parking area. The parking area would also be shifted, slightly to the east. The relocated driveway and parking area would remain outside of the property’s 50-foot boundary, and the number of spaces would remain the same. The parking area, which is currently level with the Winter’s House basement, would be raised 8 to 11 feet in elevation to allow access across the new lidded trench.

EXHIBIT 8-5
Preferred Alternative B2M Winters House Proposed Conceptual Landscape Plan

This would make the parking area level with the Winters House and would result in a visual change. Tiered retaining walls, 8 to 11 feet high, would be constructed on the east side of the parking lot along the parking area. The existing Peripheral Trail connection from the parking lot would be reconfigured to provide access from the new raised parking lot. The visual change in the parking area, associated driveways, and trailhead would not diminish the setting of the historic property as this area has already been altered from what existed adjacent to the house during the period of significance. In addition, new landscaping provided by the project would enhance the appearance of the parking lot and retaining wall.

The potential for vibration and settlement impacts on the Winters House from operation of *Preferred Alternative B2M* were evaluated using a set of building-specific outdoor and indoor vibration propagation tests as described in the FEIS. The Winters House has not been used as a residence for over 20 years and will not likely be returned to its historic use, therefore, noise and vibration are evaluated as potential impacts on an institutional land use with primarily daytime activity. Because of the close proximity of the alignment to the foundation, groundborne noise impact is projected at the Winters House, but no vibration impacts are projected. The FTA impact criterion for groundborne noise, measured in weighted decibels (dBA), is 40 dBA. The projected groundborne noise levels would range from 44 dBA to 54 dBA. Sound Transit is committed to reducing groundborne noise below FTA impact criterion and would install standard methods of vibration reduction, such as resilient fasteners, ballast mats or, a floating slab, if necessary, to eliminate the groundborne noise impact.

For the Winters House, operational vibration levels, measured in vibration velocity decibels (VdB), are projected to be 76 VdB, which is below the FTA impact criteria of 78 VdB. In addition, the projected vibration levels are well below even the most stringent criteria for damage to structures, which is 90 VdB for buildings extremely susceptible to vibration. The Winters House is in a slightly less susceptible category, which is for nonengineered timber and masonry buildings, with a 94 VdB criteria for damage.

The Criteria of Adverse Effect were applied in analyzing each aspect of *Preferred Alternative B2M*, taking into consideration the character-defining features of the property that convey its significance and qualify the property for listing in the NRHP. Despite the introduction of visual, audible, and atmospheric elements, these elements would not diminish any extant character-defining features of the property and the operational period effects from these elements are not considered an impact. *Preferred Alternative B2M* would not diminish the property’s location, because the Winters House structure would not be moved. The roadway would be the same distance from the house as existing, and the light rail facility would be in a lidded retained cut below-grade within the property’s 50-foot boundary and would therefore not be visible. The project would not alter the building’s design, materials, or workmanship, because the project would not alter or damage the building; vibration and vibration-induced settlement would be avoided. Operation of the project would not diminish the integrity of the property’s setting as there would be no noise and vibration impacts, and the existing landscaping to be removed along Bellevue Way SE is not a characteristic that qualifies it for the NRHP. The project would not impact the larger undeveloped property surrounding the house once used for bulb farming, and, therefore, the integrity of the building’s association with bulb farming and floriculture would not be diminished. In addition, the property would be landscaped after construction in a manner sensitive to the historic period. While the City of Bellevue would not receive rental income from the Winters House during construction, there would be no impacts from the project that would cause a change in the use of the structure or change economic conditions resulting in reduced maintenance of the structure. Given the above and the minimization measures discussed in Section 9.2.1.1, *Preferred Alternative B2M* would avoid impacts on the Winters House during operation.

Effects of Other B Alternatives

Alternatives B1, B2A, B2E, B3, and Alternative B3 - 114th Extension Design Option would avoid impacts on the Winters House during operation of the project. While these alternatives would encroach on the larger parcel on which the Winters House is located, no impact within the delineated historic boundary of the house would occur. For these Segment B alternatives, expansion of Bellevue Way would be limited to the existing right-of-way line at the Winters House. Alternatives B1 and B2A would be located at-grade in the center of the roadway, and, therefore, no visual, noise, or vibration impacts are anticipated on the historic setting or features contributing to the eligibility of the Winters House. Alternative B2E would be elevated to the far side of Bellevue Way, away from the Winters House, and placed up against the adjacent ridge, thus also avoiding impact on the property. Given its similar route and design, Alternative B3 and B3 - 114th Design Option would also avoid impacts on the property.

In applying the Criteria of Adverse Effect to these Segment B alternatives, none would diminish the integrity of the characteristics that enable the property to be eligible for NRHP listing, and, therefore, none would have an impact. The operation of the project would not alter the character-defining features of the former residence or its setting that convey its significance, and despite the introduction of visual, audible, and vibration elements that impact the setting of the historic property, these elements would not diminish any extant character-defining features of the property and are not considered an impact.

The operation of the alternatives would have no noise or vibration impacts, would not alter or damage the structure, would not encroach past the existing right-of-way of Bellevue Way, and would not change the existing overall transportation character of the area on the west side of the house.

Pilgrim Lutheran Church

Effects of Alternative B1

Operation of the at-grade Alternative B1 in the center of Bellevue Way would not impact the Pilgrim Lutheran Church, which is located just west of the street on the southern portion of the property. Although Bellevue Way would be realigned up to 10 feet into the property for a distance of roughly 250 feet, the parcel is large and the historic building is sufficiently distant from the portion to be acquired so that no parking would be removed and the historic property would not be impacted (Exhibit 8-6).

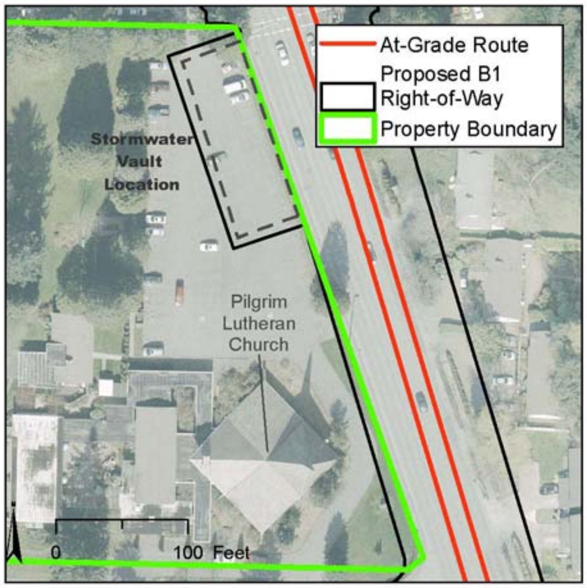

EXHIBIT 8-6
Proximity of Alternative B1 to Pilgrim Lutheran Church

The property already experiences the visual and noise impacts of heavy street traffic, and no additional impacts are expected to occur. Vibration impacts are also not expected to reach the church structure. Access from SE 11th Street to the church would not be disrupted. Additionally, an underground stormwater detention vault is proposed for construction at the northeast corner of the property in the parking area, but operation of this facility would not impact the Pilgrim Lutheran Church. The vault would not be visible after construction, and the only surface element of the vault would be one or two manholes necessary for maintenance. No parking spaces would be removed. Maintenance would consist of periodically parking a truck at the site and opening the manholes for cleaning and maintenance, and maintenance could be scheduled to avoid major events and regular services at the church. In applying the Criteria of Adverse Effect to Alternative B1, the character-defining features of the NRHP-listed Pilgrim Lutheran Church that convey its significance and qualify the property for listing in the NRHP were considered. The building is eligible for the NRHP based on its architectural significance. The operation of the project in Alternative B1 would not alter the structure or its character-defining features. In addition, the project would not diminish its setting by introducing visual, audible, or atmospheric elements that impact the character of the setting of the historic property, because the existing setting along Bellevue Way is already characterized by transportation uses and traffic noise and there are no noise or vibration impacts anticipated. Therefore, Alternative B1 would not have an impact on Pilgrim Lutheran Church.

Summary

All of the Segment B alternatives were found to have no impact on the two historic properties identified in Segment B during operations. Where potential long-term or permanent operation impacts could occur to the Winters House from the *Preferred Alternative B2M*, project design mitigates and resolves the potential impact. Operation of *Preferred Alternative B2M* within proximity to the Winters House would include vibration mitigation measures and result in no vibration or groundborne noise impacts above FTA criteria. None of the project alternatives would result in visual impacts that could diminish the integrity of the characteristics that qualify the Winters House or Pilgrim Church for NRHP inclusion or eligibility. In addition to incorporating conditions into the project to avoid potential impacts, Sound Transit would also benefit the historic resource by restoring the front yard consistent with the historic landscape and interpretative signage.

8.3.1.3 Segment C

There are two historic properties within the APE of the Segment C alternatives - the potential eligible Surrey Downs historic district (because the district has not been delineated yet), and the former Safeway store. The APE of *Preferred Alternatives C11A* and *C9T*, and Alternatives C2T, C3T, C4A, C7E, C8E, and C9A include the Surrey Downs historic district. The APE of Alternative C1T includes the Safeway store. Alternative C14E does not include any historic properties within its APE.

Potential Surrey Downs Historic District

Effects of *Preferred Alternative C11A*

When connecting to *Preferred Alternative B2M*, *Preferred Alternative C11A* is center running, transitions from an at-grade portion to a retained fill and then an elevated profile along 112th Avenue SE, and then turns west along the south side of Main Street where it returns to a retained cut at the 108th Street Station before turning north at-grade across Main Street at 108th Avenue NE. (Exhibit 8-7). When connecting to Alternative B3 or Alternative B7, *Preferred Alternative C11A* crosses elevated over 112th Avenue SE just south of Main Street and transitions to a retained cut along the south side of Main Street to the 108th Avenue Station before turning north at 108th Avenue NE.

The *Preferred Alternative C11A* route runs close to noncontributing properties within the potential Surrey Downs historic district, along the west side of 112th Avenue SE, at the northeast corner of the neighborhood, and adjacent to noncontributing and three contributing properties along its northern Main Street end. This alternative would require the removal of noncontributing buildings along 112th Avenue SE and Main Street, several of which have been converted residences into small businesses or replaced with 2- to 3-story buildings facing Main Street. While *Preferred Alternative C11A* would remove properties along 112th Avenue SE and Main Street, no properties contributing to the historic district would be removed. Along 112th Avenue SE the first two rows of properties from the roadway are noncontributing, and properties nearest the corner of 112th Avenue SE and Main Street are also noncontributing. A minimum of one row of noncontributing properties would remain between the project and the contributing properties along 112th Avenue SE. Contributing properties nearest the proposed project would not be impacted by *Preferred Alternative C11A,* because the back yards face the light rail and both noise barriers and landscaping would screen the contributing properties from the light rail and station

area. A landscaped berm would be developed between the 108th Station and Surrey Downs neighborhood, providing a visual buffer and mitigates operational noise impacts; please refer to Exhibit 8-8. The setting of the historic district would be changed by removing noncontributing properties along 112th Avenue SE and Main Street from low-rise commercial buildings to landscaping and rail tracks. Because the structures to be removed contain businesses and commercial uses, replacing with light rail and landscaping would not change the relationship that the potential Surrey Downs Districts already maintain with the existing dense downtown development along the eastern and northern edges of the historic district. The contributing properties would still be the same distance from 112th Avenue SE and Main Street, and the light rail project would not diminish the setting of the potential district in any way that would impact its eligibility for listing in the NRHP or for its contributing properties to convey their significance and to the district as a whole. Additionally, *Preferred Alternative C11A* would close SE 4th Street access to 112th Avenue SE. However, SE 1st Place would remain open, maintaining access to 112th Avenue SE for the neighborhood, including the potential Surrey Downs District. *C11A* would also close 110th Avenue SE and 110th Place access to Main Street; alternate access points to the neighborhood from Main Street via 108th Avenue SE would continue to provide access. Collectively, closing these streets would likely reduce through traffic and maintain a more residential setting than currently exists.

Preferred Alternative C11A would have potential moderate noise impacts on three contributing properties south of the proposed 108th Station. However, these noise impacts would be eliminated with a permanent sound barrier, which may include a berm and/or sound barrier along the Main Street portion of the project.

When connecting to Alternatives B3 and B7, *Preferred Alternative C11A* would not remove any properties or change access along 112th Ave SE. One row of properties along Main Street would be permanently removed for the light rail guideway and 108th Station the same as for connecting to *Preferred Alternative B2M* as discussed above.

Preferred Alternative C11A would include measures to ensure sensitivity to neighboring properties and to alleviate the impacts of operating the project. Landscaping and a permanent sound barrier along the south side of the guideway along Main Street and landscaping and permanent sound barrier along the west side of the guideway along 112th Avenue SE would enhance the neighborhood boundary where noncontributing properties would be removed. Such measures would eliminate the noise impacts and minimize visual impacts of project operation on the potential historic district.

Cross-Section of Proposed 108th Station

While the setting of the area would change somewhat due to the removal of noncontributing properties and introduction of a light rail guideway with permanent sound barrier along the northern and eastern boundaries of the potential district, the impact would not diminish the historic setting within the Surrey Downs neighborhood, which is already located in a highly developed area of Bellevue. The changes to the setting would not diminish the integrity of the district and it would continue to be eligible for the NRHP.

Effects of *Preferred Alternative C9T*

Preferred Alternative C9T, when connecting to *Preferred Alternative B2M*, travels in an at-grade profile on the west side of 112th Avenue SE before becoming a retained cut as it turns west along the south side of Main Street and enters a tunnel to continue under 110th Avenue NE. When connecting to Alternatives B3 and B7, *Preferred Alternative C9T* crosses elevated over 112th Avenue SE to follow the south side of Main Street, transitioning to a tunnel before turning north under 110th Avenue NE. *Preferred Alternative C9T* does not include the 108th Avenue Station, and removes fewer properties along Main Street than *Preferred Alternative C11A*. *C9T* is buffered by noncontributing properties adjacent to the potential Surrey Downs historic district, along the west side of 112th Avenue SE, at the northeast corner of the neighborhood, and along its northern Main Street end. *Preferred Alternative C9T* would require the removal of one row of noncontributing properties along 112th Avenue SE, one noncontributing property on the second row north of SE 1st Place, and one row of noncontributing properties along Main Street between 112th Avenue SE and 110th Place before tunneling north under 110th Avenue NE.

While *Preferred Alternative C9T* would remove a number of properties along 112th Avenue SE and Main Street, and both streets border the Surrey Downs historic district, no properties contributing to the historic district or adjacent to contributing properties would be removed. Along 112th Avenue SE the first two rows of properties from the roadway are noncontributing, and properties nearest the corner of 112th Avenue SE and Main Street are also noncontributing. Contributing properties nearest the proposed project would be separated from the project by a row of noncontributing properties and would not be impacted by the operation of *Preferred Alternative C9T* due to the distance to project.

Preferred Tunnel Alternative C9T would require closure of SE 1st Place (112th Avenue SE end) and realignment of SE 4th Street so that it connects to SE 6th Street on the other side of 112th Avenue SE (Exhibit 8-9). However, the Surrey Downs neighborhood would remain accessible from 112th Avenue SE at the realigned SE 4th Street and the areas where the streets would end, just west of 112th Avenue SE, are not adjacent to contributing properties.

When connecting to Alternatives B3 and B7, *Preferred Alternative C9T* would not remove any properties or change access along 112th Ave SE. One row of properties along Main Street between 112th Avenue SE and 110th Avenue would be permanently removed where the elevated crossing of 112th Avenue SE transitions to a tunnel on the south side of Main Street before turning north under 110th Avenue NE.

The setting of the historic district would be changed by the removal of noncontributing properties along the major roadways of 112th Avenue SE and Main Street, the at-grade light rail with a permanent sound barrier on the west side of 112th Avenue SE, light rail in a retained cut trench and tunnel portal in the vicinity of Main Street and 112th Avenue SE, and the East Main Station Design Option, if selected. However, due to the nature of the existing properties along 112th Avenue SE and Main Street near the Surrey Downs historic district, this would not be an impact. The contributing properties would be the same distance from 112th Avenue SE and Main Street, and the light rail project would not diminish the setting of the district in any way that would impact its potential for listing in the NRHP or for its contributing properties to convey their significance and that of the district as a whole. The impact would not diminish the setting within the Surrey Downs neighborhood, which is already located in a highly developed area of Bellevue. Currently the neighborhood is bounded by commercial properties,

EXHIBIT 8-9
Proximity of *Preferred Alternative C9T* and Staging Area to Potential Surrey Downs Historic District

including altered noncontributing former residences, commercial developments along the south side of Main Street, and large-scale retail properties facing the neighborhood along the major thoroughfare's north side as well as by 112th Avenue SE on the east.

The surrounding environment of the subdivision is not historic, and there is no intact historic relationship between the subdivision and 112th Avenue SE or Main Street, both highly altered roadways from their historic design and use. In addition, the neighborhood is not related to the newer commercial developments opposite Main Street, which is the boundary between the larger Surrey Downs neighborhood and Downtown Bellevue. As a result the light rail features, including the East Main Station Design Option, would be consistent with the existing setting.

Preferred Alternative C9T would not impact the potential Surrey Downs historic district, which is significant for its period of development, architectural style, and the design unity and cohesiveness of portions of the subdivision. *Preferred Alternative C9T* would not change the setting of the potential Surrey Downs historic district, as all contributing elements have been avoided by the project and the district as a whole would continue to be potentially eligible for the NRHP. No contributing properties are removed or impacted by the project. Contributing properties nearest the alternative would be buffered from the project by adjacent noncontributing properties. The setting is not a character-defining feature of the district and has been substantially changed since the period of significance. In addition, the project is consistent with the transportation character of the major roadways that border the district. Project minimization efforts, such as including landscaping and a permanent sound barrier (to eliminate noise impacts to noncontributing properties) along 112th Avenue SE and the south side of the guideway along Main Street, would protect the potential historic district from intrusion into the residential setting.

Effects of Other C Alternatives

Operation of Alternatives C2T and C3T would have no visual impacts on properties that contribute to the potential Surrey Downs historic district. Vibration and noise impacts are also not anticipated during operation.

Operation of Alternative C4A would be similar to *Preferred Alternative C11A* along 112th Avenue NE would avoid impacts on properties that contribute to the Surrey Downs historic district. Almost all of the contributing properties would be screened by existing vegetation, fences, and other houses. Landscaping would be installed along the south side of the guideway along Main Street to enhance the neighborhood boundary where noncontributing properties are removed.

The elevated Alternatives C7E and C8E are not anticipated to impact properties that contribute to the Surrey Downs historic district because the alternatives are distant enough (at least 200 feet) to avoid visual and noise impacts.

Alternative C9A would be elevated and on the east side of 112th Avenue SE, so there would be no acquisition of noncontributing properties along 112th Avenue SE. Because this alternative is elevated approximately 40 feet in this area with straddle bents, this alternative would result in visual change from the introduction of these structures. In addition, permanent sound barriers would be constructed along the west side of 112th Avenue SE and the south side of Main Street adjacent to noncontributing buildings. However, the change would not lower the area's existing visual quality and is consistent with the transportation character of the corridor. In addition, the two rows of noncontributing properties along 112th Avenue SE would remain and buffer the Surrey Downs historic district from the project.

Alternative C9A would travel at-grade on the south side of Main Street, before turning north on 110th Avenue NE, and would require the removal of one row of buildings along the south side of Main Street between 112th Avenue SE and 110th Avenue NE. None of the properties to be removed contribute to the Surrey Downs historic district. The intersection of 110th Place SE would either be gated with right-in/right-out access only or closed. However, ample access to the north end of the neighborhood would remain. Similar to *Preferred Alternatives C9T* and *C11A*, this alternative would include measures to ensure sensitivity to neighboring properties and to minimize impacts of operating the project. Landscaping and a permanent sound barrier along the south side of the guideway along Main Street would enhance the neighborhood boundary where noncontributing properties would be removed. Such measures would both eliminate the noise impact and minimize visual impacts of project operation on the historic district.

Alternative C14E would avoid impacts on properties that contribute to the potential Surrey Downs historic district, because the alternative is distant enough to avoid visual change and noise impacts.

Safeway Store

There are is only one historic property in the APE for Alternative C1, the former Safeway store located at 414, 424, and 456 104th Avenue NE (Exhibit 8-10). Alternative C1T would pass under the north edge of the sidewalk as the route turns eastward from Bellevue Way NE onto NE 6th Street in Downtown Bellevue. Alternative C1T would be in a tunnel profile as it passes by the Safeway store property approximately 170 feet from the building.

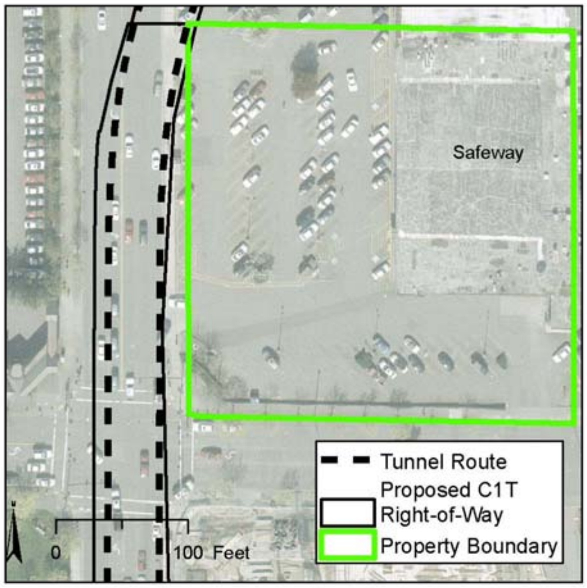

EXHIBIT 8-10
Location of Former Safeway and Surrounding Area

Since it will be located underground and considerable distance in this location, Alternative C1T would have no visual, vibration, or noise impacts during operation; therefore, no impacts to historic properties would occur from this alternative. The Safeway Store is eligible for the NRHP based on its architectural significance. The operation of the project in Alternative C1 would not alter the structure or its character-defining features.

Summary

None of the Segment C alternatives were found to have impacts on the potential Surrey Downs historic district during project operations. The alternatives would not alter or remove contributing elements to the district, and would not diminish character-defining features of the historic district, which are related to the period of construction, the architecture, and the design cohesiveness of portions of the subdivision. Applying the Criteria of Adverse Effect to all Segment C alternatives resulted in the determination that while some of the alternatives would introduce visual, audible, and atmospheric elements that change the setting of the eligible historic district, the setting is not a defining characteristic of the district, and the district would continue to be eligible for the NRHP. The district would retain its architectural cohesiveness. Due to the avoidance of all contributing properties and the minimization of impacts by the project, operation of Segment C alternatives would have no impact on the historic district.

Alternative C1T would be located underground and is therefore not anticipated to impact the historic Safeway store or any contributing element of the Safeway store.

8.3.1.4 Segment D

Effects of D Alternatives

None of the Segment D alternatives or design options have historic properties within their APE.

Former Bellevue Fire Station

Effects of Alternative D3

For Alternative D3, a narrow portion (approximately 15 feet) of the parcel that the former Bellevue Fire Station occupies would be incorporated into the project due to road reconstruction (Exhibit 8-11). However, the building is located approximately 80 feet back from the roadway, on a portion of the parcel outside of the APE, and the portion acquired is not a character-defining feature of the historic property, the significance of which is due to the building's representation of Populux architecture. Operation of the alternative would not result in visual, noise, vibration, or

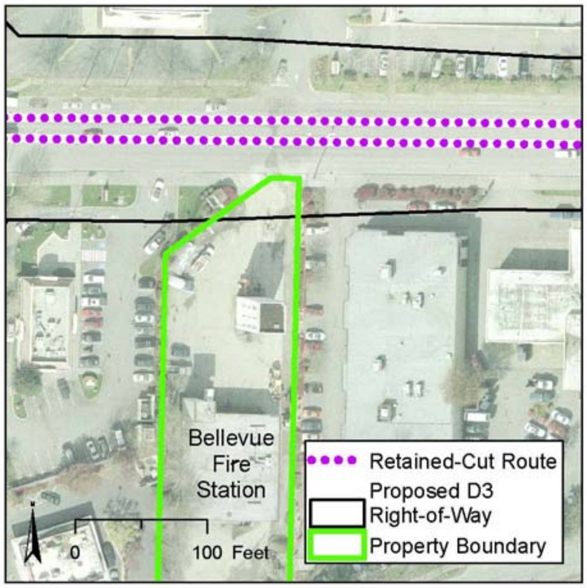

EXHIBIT 8-11
Effects of Alternative D3 on Former Bellevue Fire Station

other impacts on the property. The existing setting is characterized by major roadways: Bel-Red Road, 148th Avenue NE and NE 20th Street. Therefore widening the road and introducing the retained cut light rail is consistent with the setting and would not diminish it. Applying the Criteria of Adverse Effect, Alternative D3 would not impact the former Bellevue Fire Station because it would not alter the building nor diminish the setting.

Summary
The Segment D Alternatives were found to not impact on the historic property identified in Segment D, the former Bellevue Fire Station. No other historic properties were identified within the project APE.

8.3.1.5 Segment E

The Justice William White House and the Bill Brown Saloon are eligible for the NRHP and both within the APE of all three Segment E Alternatives—*Preferred Alternative E2* and Alternatives E1 and E4. The Dudley Carter/Haida House, not eligible for the NRHP but a Redmond Historic Landmark, is within the APE of Alternative E4.

Justice William White House, Redmond Trading Company, and Bill Brown Saloon

Effects of *Preferred Alternative E2*
Preferred Alternative E2, and the Alternative E2 - Redmond Transit Center Station Design Option that continues north on 161st Avenue NE to Redmond Transit Center, are approximately 65 feet from the Justice William White House and would not pass close enough to cause an impact on the historic setting or to potentially damage the building (Exhibit 8-12). The property is significant due to its association with individuals, William and Emma White, who built the house and set aside a portion for a hotel due to its proximity to the railroad and passenger depot. It is also significant as the best, if not the only, remaining example of Queen Anne shingle style architecture in Redmond. The house is approximately 65 feet from the guideway and is separated from the project by NE 76th Street. While *Preferred Alternative E2* and the E2 - Redmond Transit Center Design Option would introduce light rail into the setting, including a station just west of Leary Way NE, the project would be at-grade within the existing railroad right-of-way and consistent with the character of the railroad setting. The operation of passenger trains in the right-of-way is consistent with the historic use of the corridor. In addition, none of the remaining historic period buildings that contribute to the setting would be removed. Applying the Criteria of Adverse Effect, the character-defining features of the Justice William White House that convey its significance and qualify the property for listing in the NRHP would not be impacted by *Preferred Alternative E2* or the E2 - Redmond Transit Center Design Option.

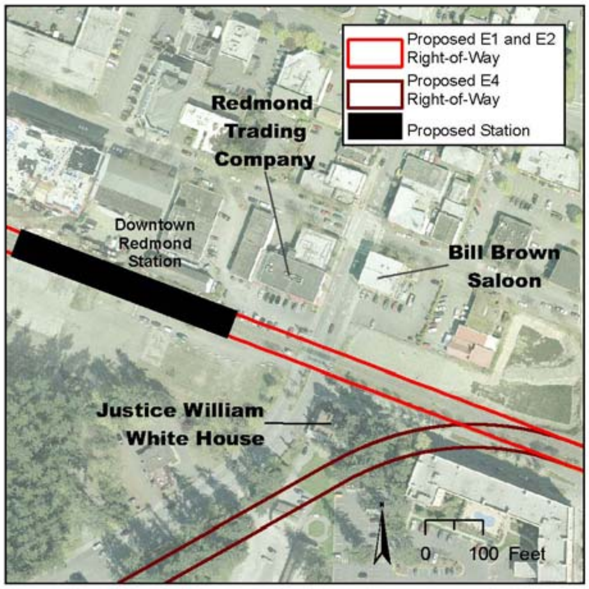

EXHIBIT 8-12
Proximity of *Preferred Alternative E2* and Alternatives E1 and E4 to Justice William White House and Bill Brown Saloon

Preferred Alternative E2 would include the Downtown Redmond Station which would be located approximately 50 feet from the Redmond Trading Company building, but would not encroach on the historic boundary of the property. None of the remaining historic period buildings that contribute to the setting would be removed. The station would be designed in coordination with the City of Redmond and the community to complement the historic setting of Downtown Redmond. Furthermore, the rail alignment and station would be located on the former BNSF corridor, and thus, would be consistent with the historic use of the corridor as a railway. *Preferred Alternative E2* would avoid impacts to the character of the setting of this historic property. No operational period impacts to the Redmond Trading Company building would occur.

Preferred Alternative E2 would pass at a sufficient distance from the Bill Brown Saloon, at least 110 feet, to avoid introducing visual, audible, and atmospheric elements that would impact the building and the character of the setting of the historic property (Exhibit 8-12). *Preferred Alternative E2* and the Downtown Redmond Station would be in the former BNSF Railway corridor, and operation of passenger trains in that right-of-way is consistent with the historic use of the corridor. In addition, none of the remaining historic period buildings that contribute to the setting would be removed. Applying the Criteria of Adverse Effect to *Preferred Alternative E2*, the character-defining features of the Bill Brown Saloon that convey its significance and qualify the property for listing in the NRHP would not be impacted.

During final design Sound Transit will work with the City of Redmond to adjust the design of *Preferred Alternative E2* within the BNSF and NE 76th Street right-of-way to accommodate the potential for future freight/commuter rail, the Central Connector utility line, the King County Trail, automobile traffic on NE76th Street as well as East Link light rail. Resulting changes may include shifting the *Preferred Alternative E2* rail alignment further from the Bill Brown Saloon and the Redmond Trading Company Building, closer to the Justice William White House. This shift in the alignment would not impact any of the three properties since *Preferred Alternative E2* would not encroach on the historic boundary, or alter the historic setting of the corridor as a railway in relation to the Justice William White House. The character-defining features of the Justice William White House and the Bill Brown Saloon that convey their significance and qualify the properties for listing in the NRHP would not be impacted by this potential shift of the alignment.

Effects of other Segment E Alternatives
The Alternative E1 route is the same at the Justice White House and the Redmond Trading Company as *Preferred Alternative E2* described above, although it does not include the Downtown Redmond Station.

Alternatives E1 and E4 would also pass at a sufficient distance from the Bill Brown Saloon to avoid impacting the character of the setting of the historic property. Alternative E1 is in the same location as *Preferred Alternative E2* near the Bill Brown Saloon, and Alternative E4 is a greater distance from the property. Applying the Criteria of Adverse Effect to Alternatives E1 and E4, the character-defining features of the Bill Brown Saloon that convey its significance and qualify the property for listing in the NRHP would not be impacted.

With Alternative E4, the project would require the relocation of the Justice William White House prior to construction. Moving the building to a new location would result in an impact on this property since it would alter the building's historic setting. Sound Transit has consulted with the City of Redmond and SHPO about moving the building to a nearby location that preserves as much of its setting, feeling, and association with the former BNSF Railway right-of-way as possible to minimize impacts from building relocation. Mitigation measures for this impact are listed in Section 9.2.2.

Alternative E4 would pass further from the Redmond Trading Company building than Alternative E2, and is thus a sufficient distance from this historic resource to avoid impacts to the character of the building's setting.

Alternative E4 would not substantially impact the Dudley Carter/Haida House, which is on the west side of NE Leary Way, opposite the light rail guideway, which would be transitioning from an elevated profile necessary to cross the Sammamish River, to at-grade. The elevated guideway would be consistent in general appearance with the bridge over the Sammamish River, but it would require the removal of mature trees along the east side of Leary Way, resulting in a decrease in visual quality. The visual impacts would be minimized with landscaping.

Summary
Preferred Alternative E2 and Alternative E1 were found to have no impact on the three historic properties identified in Segment E, the Justice William White House, the Redmond Trading Company, and Bill Brown Saloon. Operation of the proposed project alternatives would not impact the historic properties, as the properties would not be altered, the setting of the properties would remain intact, and the project is consistent with the historic use of the former BNSF Railway corridor in which it would be located. No visual, audible, or atmospheric elements that are out of character with the setting of the historic property would be introduced. Alternative E4 would result in an impact on the Justice William White House as this building would need to be relocated and its historic setting and location would be altered.

8.3.2 Effects During Construction

Construction effects on historic buildings and structures can include temporary loss of access along with visual effects, noise, vibration, and the dust and debris of construction activities. Sound Transit would implement avoidance measures to minimize these effects; however, some dust and noise are inevitable. These effects would be temporary and would not impact the properties.

Sound Transit anticipates beginning construction on the East Link Project in 2013, and construction from Seattle to Bellevue would be completed in approximately 6 years, in 2019. Construction from Bellevue to Overlake would occur in a subsequent 6-year period, from 2014 to 2020. The most intense civil construction would occur over an approximately 3-year period in most locations.

Construction activities associated with the alternatives discussed would require utility relocation, clearing and demolition, temporary roadway and lane closures, permanent acquisition of properties for stations and the routes, and temporary acquisition of properties for staging areas, hauling of materials, storing heavy equipment and materials, and light rail project construction. Construction activities would also result in temporary increases in noise, dust, and traffic congestion, but construction best management practices (BMPs) would be implemented to minimize these impacts, including standard dust and noise control measures as described in the East Link Final EIS.

This section evaluates anticipated construction impacts on historic properties identified within the project alternatives' APE, beginning with the discussion of the potential impacts for the *Preferred Alternative* for each segment.

8.3.2.2 Segment A

With the exception of I-90 between Seattle and Bellevue, historic properties along Segment A are completely separated from the project, which starts from the Downtown Seattle Transit Tunnel and continues in the center lanes of I-90. For the nonhighway (I-90) properties, no potential impacts during construction or operation are anticipated.

There are six historic properties eligible for or listed in the NRHP within the APE of Segment A: Publix Hotel, INS Building, 12th Avenue South Bridge, Will H. Thompson House, and the Mount Baker Ridge Tunnels and I-90 Lake Washington Segment. There are two additional properties eligible for listing as Seattle Landmarks, Washington Iron Works Pattern Shop and Endressen House.

Construction of Segment A is not anticipated to impact the identified historic properties. The Publix Hotel is located above the existing downtown Seattle transit tunnel, and the INS Building is situated at the east edge of the APE and would not be impacted by construction along 5th Avenue S. The project is also located far enough from the Washington Iron Works Pattern Shop that no construction activities are expected to impact the property. Construction of the at-grade route beneath the 12th Avenue South Bridge also would not impact that property. Located in the existing Mount Baker Ridge Tunnel, above which the Will H. Thompson House is situated, project construction would avoid impacts to the Thompson House.

Construction would also not impact the residence at Endressen House, given the distance of the activities from the property. Finally, construction would not impact features of the NRHP-eligible I-90 Lake Washington Segment, including the portals of the Mount Baker Ridge Tunnels, because the project will be constructed to avoid impacts to the features identified as character-defining by locating construction activities primarily within the center of I-90, which was originally designed with the intent to allow for such construction. The design, materials, and workmanship of the tunnels, portals, floating bridges, and lids will not be substantially changed. The structural integrity and intended use of the facility will be maintained. No character-defining features as identified in the NRHP Registration form for the I-90 Lake Washington Segment would be altered or removed by construction of the project. Use of the segment during construction would not impact the property in a manner that would impair future use of it as it was intended.

8.3.2.3 Segment B

There are two historic properties within the APE of the Segment B alternatives. The Winters House is within the APE of *Preferred Alternative B2M* and Alternatives B1, B2A, B2E, and B3. The Pilgrim Lutheran Church is within the APE of Alternative B1. There are no historic properties within the APE of Alternative B7.

Winters House

Effects of *Preferred Alternative B2M*

The alignment of *Preferred Alternative B2M* would run along the east side of Bellevue Way in front of the Winters House and would involve constructing a lidded retained cut within 10 feet of the base of the main structure of the NRHP-listed former residence. The lidded retained cut would be within 5 feet of the front porch of the Winters House. Construction would remove all of the vegetation in front of the house and require temporary relocation of the tenant, the Eastside Heritage Center, during construction due to loss of access. As discussed in Section 8.3.1, landscaping would be replaced after construction. The City of Bellevue owns the resource and while the City would not receive rental income from the Winters House during construction, there would be no impacts from the project that would change the long-term conditions of the house. After construction is completed, the City would continue to own and maintain the house, retaining the integrity of the building.

Constructing a lidded retained cut in this location, including construction of underground piles to structurally support the retained cut, would create the potential for vibration impacts and settlement. Given the period and type of construction of the property, there is a risk of causing impact through vibration without construction vibration-minimization techniques. The criterion for damage for this type of structure is 94 VdB or 0.2 peak particle velocity (PPV), and construction vibration could exceed this level. As a result, methods to minimize vibration during construction to prevent or limit impacts to minor cosmetic damage have been incorporated into the project as described in Appendix D1 of this report. Appendix D1 also provides further detail as to how these minimization measures will reduce construction vibration below the threshold. Minimization and avoidance techniques to prevent impacts on the property include the following:

- Photographing/inventorying the building to establish existing conditions
- Installing vibration and settlement monitoring devices and adjusting excavation methods based on monitoring results
- Using specific vibration and settlement reducing construction methods, to be determined during final design and construction; methods could include the following:
  - Using rotating/oscillating construction equipment, underpinning the house foundation and front porch, and other methods of ground improvement such as high pressure grouting
  - Constructing the retained cut side walls using slurry confinement (temporarily filling the excavated cavity with slurry material to replace removed soil) at the deepest excavation points
  - Installing a shallow temporary supporting wall to provide additional lateral support for the porch foundation footings and/or underpin the porch
- Potentially building a construction barrier around Winters House to prevent damage and minimize dust
- Applying dust control measures during construction to minimize dust (after construction, Sound Transit would clean the outside of the building and windows in a manner sensitive to the resource)
- Closing the Winters House during construction and temporarily relocating the tenant (Sound Transit will provide information to the public regarding how to access the Eastside Heritage Center during construction)
- If damage does occur, making the needed repairs consistent with U.S. Secretary of the Interior's standards for treating historic properties

The contractor would monitor vibration levels of construction equipment used for the East Link project in safe areas to anticipate vibration levels and apply avoidance measures prior to construction adjacent to the Winters House. Experience from other construction sites with similar soils has shown that by monitoring vibration and settlement during construction at the points more distant from the Winters House and incrementally upon approaching the house, the contractor can safely determine which of the vibration- and settlement-minimization and avoidance techniques would be necessary. Sound Transit will photograph and inventory the Winters House to establish existing conditions to determine if any damage is caused by construction. Utilizing these minimization and avoidance techniques would minimize the potential for vibration and settlement damage beyond minor cosmetic damage and would protect the character-defining features of the house. If damage does occur, Sound Transit will repair the building consistent with the Secretary of the Interior's *Standards for the Treatment of Historic Properties*.

The character-defining features of the NRHP-listed Winters House that convey its significance and qualify the property for listing in the NRHP may be impacted. While the alternative would introduce visual and atmospheric elements that would temporarily impact the character of the property's setting along the west/front elevation, the property's front elevation has lost some integrity due to the widening of Bellevue Way. The landscaping would be replaced after construction, and the property's relationship to the larger undeveloped area previously used for bulb farming would not change during construction. Vibration and settlement minimization and avoidance techniques would make sure that the effects introduced would not diminish the character-defining features of the former residence. Construction vibration and settlement minimization and avoidance techniques incorporated as conditions of the project would avoid or minimize damage, and, if any cosmetic damage occurs, it would be repaired. After construction, the landscaping would be restored in a manner more consistent with the historic period, as discussed above under operational impacts. The Eastside Heritage Center will be able to return to the building after construction. The minimization and avoidance techniques described above, which would be implemented by Sound Transit as part of the project, would resolve the potential for impacts during construction of *Preferred Alternative B2M*. It should be noted that at the Paramount Theater in Seattle, cut and cover construction of the Central Link light rail Pine Street stub tunnel construction was completed 9 feet away from the resource without any recorded damage.

Effects of Other B Alternatives

With Alternatives B1, B2A, B3, and B3 114th Extension Design Option, construction of the at-grade guideway located in the center of Bellevue Way SE would have temporary visual and noise effects on the Winters House that are not considered an impact. The character of the setting along Bellevue Way SE does not convey or contribute to the significance of the NRHP-listed property, and, therefore, the temporary change due to construction would not be an impact. Access to the property would be maintained during construction and the tenant would not need to be relocated. Construction would not alter or damage the building. The same is true for construction of the Alternative B2E guideway on the west side of Bellevue Way SE across from the Winters House. Alternative B7 does not impact the Winters House during construction.

Summary

In applying the Criteria of Adverse Effect to each of the Segment B alternatives, and taking into consideration the character-defining features of the NRHP-listed Winters House that convey its significance and qualify the property for listing in the NRHP, the construction impacts of the non-preferred Segment B alternatives would not remove or diminish the character-defining features of the property. *Preferred Alternative B2M* has the potential to impact the Winters House during construction. Implementation of mitigation measures would resolve these potential impacts.

Pilgrim Lutheran Church

Construction of the underground stormwater detention vault at the northeast corner of the Pilgrim Lutheran Church parking lot would have temporary noise and dust effects on the church and temporarily reduce parking, but these effects would not impair the intended use of the property and are not considered an impact. Sound Transit would avoid construction during church services and special events to the extent possible, and the remainder of the parking area would be available for use.

8.3.2.4 Segment C

The two historic properties that would be impacted by Segment C alternatives are the former Safeway store at 414, 424, and 456 104th Avenue NE and the Surrey Downs historic district.

Safeway Store

The Safeway store is also considered eligible for the NRHP. While construction effects with the Alternative C1T Alternative may result in visual disturbance, some noise, and dust, these effects are limited to Bellevue Way and small portions of the sidewalk However, because C1T would only impact the sidewalk adjoining the Safeway property, which would be over 170 feet from the structure; the store is currently closed; and a preliminary land use plan application for new construction is posted on the property, these construction effects are not considered an impact.

Potential Surrey Downs Historic District

Most of the Segment C alternatives, except for Alternatives C1, C8E, C9A, and C14E, would pass close enough to the potential Surrey Downs historic district to potentially cause some construction impact. None of the Segment C alternatives or construction staging areas would involve removal of properties that contribute to the historic district.

Effects of *Preferred Alternative C11A*
Construction staging areas adjacent to the potential Surrey Downs historic district would be needed to construct *Preferred Alternative C11A*. Construction staging areas are needed before, during, and for a short time after construction work occurs to store and maintain construction equipment and material and fabricate project component. Staging areas might also include contractor trailers (which would act as temporary offices and places for contractors to meet) and construction crew parking.

Construction of *Preferred Alternative C11A* would not involve removal of properties that contribute to the Surrey Downs historic district, and the removal of the other buildings would not damage the district's setting, feeling, or association. The *Preferred Alternative C11A* when connecting from P*referred Alternative B2M* would remove properties along the south side of Main Street between 112th Avenue SE and 108th Avenue SE and a row of properties along 112th Avenue SE north of Surrey Downs Park. When connecting from B3 or B7, the construction would not require removing properties along 112th Avenue SE, but the same properties along Main Street would be removed. These parcels would be used for construction of the project and for staging. Exhibit 8-8 depicts the staging area. As shown in Exhibit 8-9, construction staging would occur adjacent to three contributing buildings near the intersection of Main Street and 108th Avenue NE. Minimization and avoidance techniques would include installation of a solid construction barrier to shield the homes from construction, and to the extent practical, preservation of the evergreen trees along the south edge of the station area, east of 108th Avenue SE. All equipment would be fenced for safety purposes. Construction staging in itself provides a buffer from construction activities.

Construction of *Preferred Alternative C11A* along Main Street and 112th Avenue SE is expected to occur largely during daytime working hours. Construction would result in some impacts on nearby residences, including any construction activities that may occur at night with visual, lighting, and noise impacts. Access to properties in the neighborhood would be altered at times during construction. Construction activities may cause dust, noise and lighting spill over to adjacent properties. These potential impacts can be minimized. Construction impact minimization measures included in the project, such as noise and dust control, would reduce construction impacts. The residences would remain habitable during the construction period.

Sound Transit would, as practical, limit construction activities that produce the highest noise levels to daytime hours, or when disturbance to sensitive receivers would be minimized. For any nighttime work, contractors would be required to meet the criteria of the noise ordinance for the city and would seek the appropriate noise variance for operation of construction equipment that could exceed allowable noise limits during nighttime hours (between 10:00 p.m. and 7:00 a.m.), on Sundays or legal holidays. Sound Transit would control nighttime construction noise levels by applying noise level limits and noise control measures to meet these noise limits. Noise control measures for nighttime and daytime may include the following efforts, as necessary, to meet required noise limits:

- Installing construction noise barrier wall by noise sensitive receivers
- Using smart back-up alarms during nighttime hours, to automatically adjust alarm levels based on background level, or use of spotters.
- Using low-noise emission equipment
- Implementing noise-deadening measures for truck loading and operations
- Monitoring and maintenance of equipment to meet noise limits
- Covering lined or covered storage bins, conveyors, and chutes with sound-deadening material
- Using acoustic enclosures, shields, or shrouds for equipment and facilities
- Using high-grade engine exhaust silencers and engine casing sound insulation
- Prohibiting aboveground jack-hammering and impact pile driving during nighttime hours
- Minimizing the use of generators to power equipment
- Limiting use of public address systems

- Grading surface irregularities on construction sites
- Using moveable noise barriers at the source of the construction activity
- Limiting certain noisy activities during nighttime hours

With impact minimization measures, including a construction barrier and noise control measures, the project would resolve the potential impacts to the potential historic district or its contributing elements.

Effects of *Preferred Alternative C9T*

Construction of *Preferred Tunnel Alternative C9T* and its construction staging areas, when connecting to *Preferred Alternative B2M*, would require removal of one row of properties on the west side of 112th Avenue SE, the south side of Main Street between 112th Avenue SE and 110th Place, and an additional property on the second row north of SE 1st Place. These parcels would be used for construction of the project and for staging (as described earlier under the *Preferred Alternative C11A)*. Exhibit 8-7 depicts the staging area. Construction and staging would not be adjacent to any contributing buildings. This alternative would have fewer impacts along Main Street than *Preferred Alternative C11A* because it does not include the 108th Avenue Station and it turns north to tunnel under 110th Avenue NE rather than continuing to 108th Avenue NE. No properties that contribute to the potential Surrey Downs historic district would be removed, and the removal of the other buildings would not damage the district's setting, feeling, and association. Construction would result in some impacts on nearby residences, including construction activities that often may occur at night with visual, lighting, and noise impacts. Access to properties in the neighborhood would be altered at times during construction. The impacts would be temporary, however. The installation of a solid construction barrier along the boundary of the construction area will reduce noise and visual impacts. Additional measures to control nighttime construction noise levels for *Preferred Alternative C11A* are discussed above.

When connecting to Alternatives B3 and B7, construction of *Preferred Alternative C9T* would remove properties near the corner of Main Street and 112th Avenue SE, and one row of properties along Main Street between 112th Avenue SE and 110th Avenue where the elevated crossing of 112th Avenue SE transitions to a tunnel on the south side of Main Street before turning north under 110th Avenue NE. These areas would be used for construction staging. In The area along Main Street, the impacts are similar to the *Preferred Alternative B2M* connection as described previously.

Effects of other Segment C Alternatives

None of their alternatives require the removal of property along 112th Avenue SE south of SE 1st Place adjacent to the potential Surrey Downs historic district.

Alternatives C2T and C3T would involve connectors from Alternatives B2A, B2E, B3, and B7. The connector from Alternative B2A to Alternatives C2T and C3T would involve boring beneath the Surrey Downs historic district, which would avoid access and visual effects. Noise and possible vibration could be noticeable to residents during construction but would not impact the buildings. Although the geotechnical analysis shows that the soils in this area are generally resistant to settlement from ground disturbance, precautions during construction and a careful monitoring program would be incorporated into the construction plan.

The connector from Alternative B2E to C3T and C2Twould use the northern area of the Surrey Downs neighborhood for construction staging at the tunnel portal. This area would extend south from Main Street to one row north of SE 2nd Street on both sides of 110th Place and starting one row back from 110th Avenue SE and between Main Street and SE 1st Place. Construction would alter access at times during construction and would produce visual, noise, dust and possible vibration impacts. The impacts would be temporary. Sound Transit would minimize visual and noise impacts through placement of a solid construction barrier between the construction area and adjacent contributing properties to the south and west as well as implement dust control measures. This area could be developed as a park after construction consistent with the City of Bellevue's Parks and Recreation Plan. With minimization measures, the potential construction impacts from Alternatives C2T and C3T to this resource would be resolved.

For connectors from Alternatives B2A and B2E to Alternative C4A, construction staging areas would be similar to the construction staging area described for *Preferred Alternative C11A*, which includes removing one to two rows of properties south of Main Street. Construction would alter access at times during construction and would produce visual, noise, dust and possible vibration impacts. The impacts would be temporary. Sound Transit would minimize visual and noise impacts through placement of a solid construction barrier between the construction area and adjacent contributing properties to the south and west as well as implement dust control measures. For connectors from B3 and B7 to C4A, construction staging would involve a smaller area but would still be adjacent to portions of the Surrey Downs historic district. Construction of connectors to Alternative C4A would be of a shorter duration and require less nighttime construction than construction for tunnel alternatives, such as C2T, C3T, and *Preferred Alternative C9T*. With minimization measures, the potential construction impacts from Alternative C4A to this resource would be resolved. There would be no impact on the Surrey Downs historic district for connectors from B3 and B7 to C7E and C8E alternatives.

To meet required noise limits, noise control measures for nighttime and daytime for Alternatives C2T, C3T and C4A would be the same as those discussed above for *Preferred Alternative C11A*.

Alternative C9A would require similar property acquisition for construction staging as *Preferred Alternative C9T*, with the addition of one building west of 110th Place on the south side of Main. The elevated and at-grade construction for Alternative C9A would be of a shorter duration and require less nighttime construction than tunnel alternatives. Alternative C14E is located far enough away from the historic district as to have no impacts on it or on the properties within it.

Summary

In applying the Criteria of Adverse Effect to all Segment C alternatives, the character-defining features of the eligible potential Surrey Downs historic district that convey its significance and qualify the district and contributing properties for listing in the NRHP were considered. *Preferred Alternative C11A* and Alternatives C4A, C2T, and C3T would have potential impacts to this resource. These potential impacts would be resolved with construction minimization measures. Construction of these alternatives would introduce visual, audible, and atmospheric elements that temporarily change the setting of the eligible historic district. However, the alternatives would not alter or remove contributing resources to the district. The district would retain its architectural cohesiveness. In addition, project design and construction measures would further ensure that none of the effects introduced would be considered an impact. Alternative C1T runs on Bellevue Way and is 170 feet from the front of the eligible Safeway Store. Constructing this alternative might result in some visual disturbance, some noise, and dust, which would be limited to Bellevue Way. Given that the construction effects are minimal, it is not considered an impact.

8.3.2.5 Segment D

There are no historic properties within the APE of *Preferred Alternative D2A*, the D2A - 120th or NE 24th Design Options, Alternative D2E, and Alternative D5. The former Bellevue Fire Station is within the APE of Alternative D3.

Former Bellevue Fire Station

With Alternative D3, construction of the alternative in a retained cut near the former Bellevue Fire Station would not impact the property. Although part of the building’s parcel is situated inside the APE, the building itself is outside the APE and would not be impacted by the construction activities proposed.

Applying the Criteria of Adverse Effect to analyze Alternative D3, the character-defining features of the property were considered. The alternative would not alter or remove the building or its architectural elements, so it would maintain its character-defining features that convey its significance. The proposed project would not result in any visual, audible, or atmospheric elements that would impact the property.

8.3.2.6 Segment E

Two historic properties, the Justice William White House and the Bill Brown Saloon, are within the APE of *Preferred Alternative E2* and Alternatives E1 and E4.

Justice William White House

Effects of *Preferred Alternative E2*

Preferred Alternative E2, and the E2 - Redmond Transit Center Design Option that continues west and turns north on 161st Avenue NE to Redmond Transit Center, would not pass close enough to the Justice William White House to cause an impact on the historic setting or to potentially damage the building during construction. *Preferred Alternative E2* would temporarily increase noise and dust and result in visual change due to construction activities, but these effects would not result in an impact. In addition, NE 76th Street and existing vegetation would buffer the house from construction activities and further minimize the visual change and dust. Project construction would not impact the character-defining features of the property.

Effects of Other E Alternatives

Alternative E1 is in the same location as *Preferred Alternative E2* near the Justice William White House. Therefore, Alternative E1 would have the same temporary noise, dust and visual effects on the property as *Preferred Alternative E2* and would not impact the property.

Alternative E4 would require relocating to the Justice William White House. Moving the building prior to construction would cause an impact, as discussed under effects during operation. Relocation would occur in a manner that avoids substantial damage to the building during transport and re-establishment, which would minimize but not fully avoid a potential impact.

Summary

In applying the Criteria of Adverse Effect to all Segment E alternatives, the character-defining features of the Justice William White House that convey its significance and qualify the property for listing in the NRHP were considered. *Preferred Alternative E2* and Alternative E1 would not pass close enough to introduce visual, audible, and atmospheric elements that would impact the character of the setting of the property. Alternative E4 would result in a potential impact due to the need to relocation the building prior to construction. Potential for damage to the building would be minimized as discussed in Section 9.2.1.

Redmond Trading Company

All of the Segment E alternatives would pass at a close enough distance that construction of these alternatives may result in visual disturbance, some noise, and dust. These affects would be temporary and would not impact the property.

Bill Brown Saloon

All of the Segment E alternatives would pass at a close enough distance that construction of these alternatives may result in visual disturbance, some noise, and dust. These affects would be temporary however would not impact the property.

8.3.3 Maintenance Facilities

None of the maintenance facilities—116th Avenue (MF1), 124th Avenue NE (MF2), SR 520 (MF3), and Redmond (MF5)—have historic properties located in their APE; therefore, no historic properties would be impacted by the construction of these facilities.

9.0 Minimization and Mitigation Measures

The Section 106 process provides a procedure to seek ways to avoid, minimize, or mitigate adverse effects on historic properties. Potential mitigation is required if project activities directly or indirectly cause adverse effects to recognized historic properties. Participants in the Section 106 process include agency officials; the ACHP; consulting parties such as the SHPO, Native American Tribes, and local government representatives; and the public, as appropriate.

Given that FTA, in consultation with SHPO, has made a determination of Adverse Effect for the project, an MOA is required pursuant to 36 CFR 800.6[c]. Adverse impacts on historic properties must be resolved through the Section 106 process by preparing an MOA. This document records the terms and conditions agreed upon to resolve the impact of the project on historic properties, and is signed by Sound Transit and FTA, the SHPO, and other consulting parties, if appropriate. Sound Transit will comply with all local ordinances on impacts to historic resources.

An MOA contains stipulations specifying avoidance, minimization, or mitigation measures to be implemented to resolve the potential impacts. A draft MOA addresses potential impacts on the Winters House, potential Surrey Downs historic district, and archaeological resources. The proposed measures for these resources are also described in this section.

9.1 Archaeological Sites

Although some potentially sensitive archaeological areas are identified, studies to date have identified no NRHP-eligible prehistoric or historic-period archaeological sites in the project APE.

Although much of the APE has seen ground disturbance, fill, and development, it is possible that one or more archaeological sites may exist beneath the ground surface in areas where project excavation would take place. Project archaeologists will conduct additional subsurface testing before construction— activities referred to as Stage 2 survey— and/or monitor ground-disturbing activities in archaeologically sensitive areas during construction.

An Archaeological Resources Monitoring and Treatment Plan (ARMTP), or an Unanticipated Discovery Plan (UDP), will be prepared based on the Archeological Survey Plan (Appendix A)to provide additional information that would guide archaeological monitoring work during East Link Project construction. FTA and Sound Transit will coordinate with SHPO, the Muckleshoot and Snoqualmie tribes, and other interested parties as appropriate, to review the plan.

In the event that significant archaeological deposits are inadvertently discovered during construction in any portion of the project area, ground-disturbing activities will be halted and the procedures of the UDP followed. If ground-disturbing activities encounter human skeletal remains during the course of construction, FTA and Sound Transit will implement relevant procedures in the UDP and follow federal and state laws regarding the discovery of human remains. If the remains are determined to be Indian, FTA and Sound Transit will notify DAHP and the affected tribes to consult regarding treatment of the remains.

9.2 Historic Buildings and Structures

The East Link *Preferred Alternative B2M* has the potential to cause an impact on the Winters House. Preferred Alternative C11A and Alternatives C4A, C2T, and C3T have the potential to cause an impact on the potential Surrey Downs historic district. The project has the potential to cause an impact on the Justice William White House through Alternative E4. Table 9-1 summarizes the historic properties; and the properties listed, or recommended as eligible for listing, in the NRHP; the mitigation or minimization measures proposed to resolve potential impacts to the resource.

9.2.1 Minimization Measures

The following minimization measures will be incorporated into the project, avoiding a potential impact n adverse effect of the project, consistent with 36 CFR Park 800.5(b). General minimization efforts to be incorporated in to the project that could further minimize effects on historic properties would include the following

- Take precautions that historic properties are protected from vibrations, excavations, and damage from heavy equipment.
- Protect facades of affected historic buildings from an accumulation of excessive dirt and dust during construction, and/or clean them in an appropriate manner at the conclusion of construction. Sound Transit would consult with the SHPO before implementing any protection or cleaning methods.
- Control fugitive dust using measures listed in the EIS Air Quality Section.
- Maintain access to historic properties to the extent possible.

The above mentioned minimization measures would resolve impacts on the Safeway Store, the Former Bellevue Fire Station, the Bill Brown Saloon, and the Redmond Trading Company. Additional, resource specific minimization measures are described below.

9.2.1.1 Winters House

All measures to minimize potential operational period impacts to the Winters House are incorporated in project design and specified in the MOA.

Operation of *Preferred Alternative B2M*

- Standard methods of vibration reduction, such as resilient fasteners or ballast mats will be incorporated into the project and a floating slab would be incorporated as necessary to reduce the level of groundborne noise and eliminate the impact.
- Landscape the area of property between the front (west elevation) of the Winters House and Bellevue Way SE to more closely reflect the landscaping of the historic period, in consultation with the City.
- Sound Transit will provide interpretive signage on or near the Winters House property in consultation with the City of Bellevue.

Construction of *Preferred Alternative B2M*

- Photograph and inventory the building to establish existing conditions.
- Install vibration and settlement monitoring devices and adjust excavation methods based on monitoring results.
- Use specific vibration- and settlement-reducing construction methods (to be determined during final design and construction); methods could include the following:
    - Using rotating/oscillating construction equipment, underpinning the house foundation and front porch, and other methods of ground improvement such as high pressure grouting
    - Constructing the retained cut side walls using slurry confinement (temporarily filling the excavated cavity with slurry material to replace removed soil) at the deepest excavation points
    - Installing a shallow temporary supporting wall to provide additional lateral support for the porch foundation footings and/or underpin the porch
- Potentially build a construction barrier around Winters House to prevent damage and minimize dust.
- Close the Winters House during construction and temporarily relocate the tenant (Sound Transit would provide information to the public regarding how to access the Eastside Heritage Center during construction).
- If damage does occur, make the needed repairs consistent with the U.S. Secretary of the Interior's standards for treating historic properties.

TABLE 9-1
Historic Properties within Project Area of Potential Effect, Eligibility, and Effect Findings

Segment	Map ID	Property Name/Type	Address	Register Status	Avoidance Minimization Mitigation	Effect Findings
A, Interstate 90	376	Publix Hotel (Seattle Chinatown NRHP/ International Special Review historic district)	504 5th Avenue South	Contributing element to NRHP and Seattle Special Review historic districts	Project avoids resource.	No Impact
	132	Immigrant Station and Assay Office	815 Airport Way South	NRHP, WHR, eSL	Project avoids resource.	No Impact
	303	Jose Rizal 12th Avenue South Bridge	12th Avenue South crossing of South Dearborn Street	NRHP, WHR, eSL	Project avoids resource.	No Impact
	166	Will H. Thompson House	3119 South Day Street	NRHP, WHR, SL	Project avoids resource.	No Impact
	I90	I-90 Lake Washington Highway Segment between mileposts 3.4 and 8.9 (includes Mount Baker Ridge Tunnel and Eastern Portals)	I-90 between mileposts 3.4 and 8.9	eNRHP, eWHR, SL[a]	Project is consistent with the character and design intent of I-90.	No Impact
	156	Endresen Residence	1402 32nd Avenue South	eSL	Project avoids resource.	No Impact
	133	Romaine Electric/Washington Iron Works Pattern Shop	1101 Airport Way South	eSL	Project avoids resource.	No Impact
B, South Bellevue	16	Frederick Winters House	2102 Bellevue Way SE	NRHP, WHR	All alternatives, except *Preferred Alternative B2M* avoid resource. *Preferred Alternative B2M* designed with minimization and mitigation measures during construction and in operations. Project would benefit the property with landscape improvements consistent with the historic period and interpretative signage.	Potential Impact for Alternative B2M only
	63	Pilgrim Lutheran Church	10420 SE 11th Street	eNRHP, eWHR	Project avoids resource; small area of parking lot is affected, away from resource.	No Impact

TABLE 9-1
Historic Properties within Project Area of Potential Effect, Eligibility, and Effect Findings

Segment	Map ID	Property Name/Type	Address	Register Status	Avoidance Minimization Mitigation	Effect Findings
C, Downtown Bellevue	various	Potential Surrey Downs historic district	Between 108th Avenue and 112th Avenue SE, south of Main Street (see Table 7-4)	Potentially eNRHP, eWHR	*Preferred Alternative C11A*: project avoids resource; resource is separated from project with landscaped buffer and noise barrier. Construction minimization measures in place.	Potential Impact
	1100	Safeway Store	414, 424, and 456 104th Avenue NE	eNRHP	Project avoids resource.	No Impact
D, Bel-Red/Overlake	104	Former Bellevue Fire Station	14822 NE Bellevue-Redmond Road	eNRHP, eWHR	Project avoids resource.	No Impact
E, Downtown Redmond	112	Justice William White House	Leary Way NE and NE 76th Street	eNRHP, eWHR, RHL	Project avoids resource, except for Alternative E4 (requires relocation of the house).	Potential Impact for Alternative E4 only
	113	Redmond Trading Company	7805 Leary Way NE	eRHL	Project avoids resource	RHL
	114	Bill Brown Saloon Building	7824 Leary Way NE	RHL, eNRHP, eWHR	Project avoids resource.	No Impact
	118	Dudley Carter/Haida House	Sammamish Slough Park	RHL	Project avoids resource.	No Impact

NRHP	National Register of Historic Places
WHR	Washington Heritage Register
SL	Seattle Landmark
RHL	Redmond Historic Landmark
e	determined eligible

[a] The Mount Baker Ridge Tunnel and Eastern Tunnel Portals are also designated as Seattle Landmarks

9.2.1.2 Pilgrim Lutheran Church

Operation of Alternative B1

- Avoid stormwater vault maintenance during church services and special events to the extent possible.
- Minimize parking space obstruction during stormwater vault maintenance.

Construction of Alternative B1

- Apply typical BMPs to minimize and avoid construction impact.
- Avoid construction during church services and special events to the extent possible.
- Restore disturbed areas following construction.

9.2.1.3 Potential Surrey Downs Historic District

All measures to minimize potential operational period impacts to the Winters House are incorporated in project design and specified in the MOA.

Operation

Preferred Alternative C11A

- Install a permanent sound barrier along the south side of the guideway along Main Street to prevent noise impacts on contributing properties in the potential Surrey Downs historic district.
- Landscape along south side of the guideway and the 108th Station along Main Street where noncontributing properties are removed.

Alternative C4A

- Install a permanent sound barrier along the south side of the guideway along Main Street, adjacent to contributing properties.
- Landscape along the south side of the guideway along Main Street to enhance the neighborhood boundary where noncontributing properties are removed.

Construction

Preferred Alternative C11A **and Alternative C4A**

- Apply typical BMPs to minimize and avoid construction impacts.
- Before construction begins, install a solid construction barrier along contributing properties south of Main Street.
- Where possible, preserve the evergreen trees along the south edge of the proposed station area, east of 108th Avenue SE.

Alternative C2T and C3T

- Apply typical BMPs to minimize and avoid construction impacts.
- Before construction begins, install a solid construction barrier along contributing properties south of Main Street.

9.2.2 Mitigation for Adverse Effects

Justice White House, Alternative E4

Consult with SHPO to determine whether an appropriate location can be found to relocate this resource. If such a location can be determined, FTA and Sound Transit would consult with SHPO, the City of Redmond, and other interested parties to develop and to determine a suitable relocation site that preserves the Justice William White House’s setting, feeling, and association with the railroad, thus maintaining its eligibility for the NRHP. The relocation would be managed by qualified architects and engineers in a manner to avoid damage to the building and preserve its eligibility for listing in the NRHP. Prior to relocating the building, Sound Transit would fully record the building in its original context through a Level II Historic American Building Survey/Historic American Engineering Record documentation. This would include photographs, measured drawings, and a written history component. If alternative E4 were selected, then the MOA would be altered to include mitigation for the Justice William White House.

10.0 Cumulative Effects

Reasonably foreseeable future actions in the project vicinity would have no direct impacts on specific historic or archaeological resources in the East Link Project study area. However, cumulatively, the past, present, and future projects affect historic properties and archaeological resources. Incrementally, new infrastructure and development patterns change the historic setting of specific resources as a result of past and ongoing urbanization, particularly in Bellevue and Redmond.

East Link could affect the Winters House and the potential Surrey Downs historic district in Bellevue and the Justice William White House in Redmond. The settings surrounding these structures have already been altered by the development, increasing traffic conditions, and changes of uses surrounding them. Incrementally, East Link is part of the changing fabric of urbanization. In this regard, there is an incremental cumulative impact on historic resources. No direct or indirect impacts on archaeological resources are expected; therefore, no cumulative impact is expected.

Appendix I

Mitigation Plan

Appendix I

Mitigation Plan

I.1 Introduction

The mitigation plan for East Link describes Sound Transit's preliminary mitigation commitments, which include all the mitigation measures Sound Transit proposes to implement to avoid or minimize impacts from the *Preferred Alternatives* identified in the Final EIS. If the Sound Transit Board ultimately selects another alternative to build differing from the *Preferred Alternatives*, the mitigation plan will be modified accordingly. The following are the *Preferred Alternatives*:

- Segment A: *Preferred Interstate 90 Alternative (A1)*
- Segment B: *Preferred 112th SE Modified Alternative (B2M)*
- Segment C: *Preferred 108th NE At-Grade Alternative (C11A)* and *Preferred 110th NE Tunnel Alternative (C9T)*
- Segment D: *Preferred NE 16th At-Grade Alternative (D2A)*
- Segment E: *Preferred Marymoor Alternative (E2)*

The mitigation measures described below are based on the potential mitigation measures identified in the Final EIS. Measures associated with the operation of East Link (long-term impacts) are described first; measures associated with construction are described second. These mitigation measures will be tracked in a monitoring program to ensure that the mitigation commitments are being met and addressed.

I.2 Transportation Potential Mitigation Measures

I.2.1 Regional Travel Mitigation Measures

No adverse impacts have been identified and no mitigation is proposed.

I.2.2 Transit Mitigation Measures

No adverse transit impacts have been identified during East Link operations and no mitigation is proposed.

During construction, existing park-and-ride lots (South Bellevue Park-and-Ride and Overlake Transit Center) would either be partially or fully closed. Measures to mitigate the loss of parking at these locations could include the following:

- Route transit riders that use these locations to available spaces at nearby park-and-ride lots, such as the Eastgate or Overlake Village Park-and-Ride Lots.
- Lease parking lots and/or new parking areas within the vicinity of the closed park-and-ride lot.

The South Bellevue Park-and-Ride Lot, Bellevue Transit Center, and Overlake Transit Center would either be partially closed or fully closed during construction. For these and other transit centers impacted during construction, Sound Transit would work with King County Metro and private transit service providers to revise transit service and minimize disruptions to bus facilities and service. Measures to minimize impacts to transit service may include the following:

- Relocate transit stops to adjacent streets.
- Provide a temporary transit center at a nearby off-street location.
- Revise transit services by rerouting buses where appropriate.
- Post informative signage before construction at existing transit stops that would be affected by construction activities.

I.2.3 Highway Operations and Safety Mitigation Measures

No adverse impacts have been identified and no mitigation is proposed during East Link operations.

During East Link construction, Sound Transit would coordinate with the Washington State Department of Transportation (WSDOT) on incident management, construction staging, and traffic control where the light rail construction might affect freeway traffic. Sound Transit would also coordinate with WSDOT to disseminate construction closure information to the public as needed.

I.2.4 Arterials and Local Streets Mitigation Measures

This section discusses mitigation for impacts on intersection level of service (LOS) and parking during project operation, and mitigation for impacts during project construction. Final mitigation would be coordinated with each affected jurisdiction through subsequent phases of this project.

I.2.4.1 Intersection Level of Service

Arterial and local street mitigation is potentially required at intersections where the intersection LOS with the East Link Project would degrade to levels that do not meet the LOS standards of the jurisdiction compared to the No Build Alternative. The intersections that would potentially be affected and their related improvements are discussed in the following subsections.

Segment A
In Segment A, under *Preferred Alternative A1*, five intersections on Mercer Island would potentially require turn pockets or traffic signal improvements to adjust for the change in travel patterns to and from the island. Improvements at intersections within the City of Mercer Island's jurisdiction include:

- West Mercer Way and 24th Avenue SE: Provide southbound left-turn pocket.
- 80th Avenue SE and SE 27th Street: Install a traffic signal.
- 77th Avenue SE and North Mercer Way: Install a traffic signal.

Improvements at intersections within WSDOT's jurisdiction include:

- 77th Avenue SE and I-90 eastbound off-ramp: Install a traffic signal.
- 76th Avenue SE/North Mercer Way and I-90 Westbound on-ramp: Modify the westbound channelization to provide left-turn pocket and through/right shared lane.

All of these improvements would improve the AM and PM peak hour intersection LOS to the same or better than no-build conditions. Sound Transit would be responsible for implementing improvements at the two intersections within WSDOT's jurisdiction prior to East Link opening service. Sound Transit would contribute its proportionate share of costs to improve intersections within the City of Mercer Island's jurisdiction. Sound Transit's contribution would be determined by the project's ratio of trips at the intersection or another equitable method. Through this contribution, the City of Mercer Island might determine other improvements than the intersection modifications listed that are more compatible with downtown Mercer Island.

Segment B
No adverse impacts on intersection LOS have been identified, and no mitigation is proposed.

Segment C
Under *Preferred Alternative C11A*, an eastbound right-turn pocket would be provided at the 112th Avenue NE and Main Street intersection. Additionally, at the Main Street and 108th Avenue NE intersection (with *Preferred Alternative C11A*) and at the NE 4th Street and 108th Avenue NE intersection (with *Preferred Alternatives C11A* and *C9T*), mitigation to better use the roadway capacity could be implemented, such as providing active traffic management strategies. For example, active signing could be installed to more effectively route vehicles to less congested streets; turn movements could be restricted during congested periods; or adaptive signal controllers could be installed to better respond to changing traffic conditions.

Segment D
Under *Preferred Alternative D2A*, a southbound right-turn pocket at the intersection of 152nd Avenue NE and NE 24th Street would mitigate impacts. This improvement or a similar intersection improvement would be coordinated with the City of Redmond.

Segment E
Under *Preferred Alternative E2*, the following intersections would require mitigation as described below:

- NE 76th Street and 170th Avenue NE: Install a traffic signal.
- SR 202 and NE 70th Street: Provide a southbound right-turn pocket.
- SR 202 and East Lake Sammamish Parkway: Rechannelize to provide an additional southbound through lane.
- NE 70th and 176th Avenue NE: Install a traffic signal.

I.2.4.2 Parking

Mitigation for potential hide-and-ride activities near stations and the best ways to mitigate such activities are specific to each area surrounding a station. The station most likely to generate hide-and-ride impacts is the Rainier Station. At the Mercer Island and South Bellevue Stations the parking analysis determined a low potential for hide–and-ride impacts. However, given the locations of these stations, Sound Transit will evaluate hide-and-ride impacts within one year of East Link commencing operations. If impacts are determined, Sound Transit would implement appropriate mitigation measures as discussed in this section.

Prior to implementing any parking mitigation measures, Sound Transit would inventory on-street parking around each of the three stations listed up to one year prior to the start of light rail revenue service. These inventories would document the current on-street parking supply within a one-quarter-mile radius of the stations. Based on the inventory results, Sound Transit and the local jurisdiction would work with the affected stakeholders to identify and implement appropriate mitigation measures, if necessary.

Parking control measures could consist of parking meters, restricted parking signage, passenger and truck load zones, and residential parking zone (RPZ) signage. Other parking mitigation strategies could include promotion of alternative transportation services (e.g., encourage the use of bus transit, vanpool or carpool services, walking, or bicycle riding).

For parking controls agreed to with the local jurisdiction and community, Sound Transit would be responsible for the cost of installing the signage or other parking controls and any expansion of the parking controls for one year after opening the light rail system. The local jurisdictions would be responsible for monitoring the parking controls and providing all enforcement and maintenance of the parking controls. The local residents would be responsible for any RPZ-related costs imposed by the local jurisdiction.

I.2.4.3 Construction Mitigation

All mitigation measures associated with the construction of the East Link Project would comply with local regulations governing construction traffic control and construction truck routing. Sound Transit would finalize detailed construction mitigation plans in coordination with local jurisdictions and WSDOT during the final design and permitting phase of the project. Mitigation measures for traffic impacts due to light rail construction could include the following:

- Follow standard construction safety measures, such as installing advance warning signs, installing highly visible construction barriers, and using flaggers.
- Use lighted or reflective signage to direct drivers to truck haul routes and enhance visibility during nighttime work hours.
- Use temporary reflective truck prohibition signs on streets with a high likelihood of cut-through truck traffic.
- In areas with high levels of traffic congestion, schedule traffic lane closures and high volumes of construction traffic during off-peak hours to minimize delays where practical.
- Provide public information through tools such as print, radio, posted signs, websites, and e-mail to provide information regarding street closures, hours of construction, business access, and parking impacts.
- Access closures would be coordinated in person with affected businesses and residents. If access closures are required, property access to residences and businesses would be maintained to the extent possible. If access to the property was not able to be maintained, the specific construction activity would be reviewed to determine if it could occur during non-business hours, or if the parking and users of this access (for example deliveries) could be provided at an alternative location.
- Where necessary, the contractor could be responsible for providing parking areas for construction workers.

Also, please refer to Section I.5 for more construction mitigation measures for businesses.

I.2.5 Nonmotorized Facilities Mitigation Measures

No adverse impacts on nonmotorized facilities have been identified; therefore, no mitigation is proposed during East Link operations.

Sound Transit would provide nonmotorized improvements at East Link stations, as shown in the conceptual engineering drawings in Appendix G1. Sound Transit would work with the local agencies regarding alternatives and stations that are located within the median of roadways so that the most appropriate treatments are provided for safe and effective pedestrian crossings and access. These treatments could include painted crosswalks or signals, street lighting, warning lights, or signage.

During construction, Sound Transit would minimize potential impacts on pedestrian and bicycle facilities by providing detours or clearly delineated facilities within construction areas such as protected walkways and notify the public as determined appropriate by the project.

Multiuse trails that might be affected by construction would generally be kept open for use, but detours would be provided when trails are closed, unless they are closed for short durations or in areas where a detour option is not feasible. Public notification efforts would be conducted for temporary trail closures during construction.

I.2.6 Freight Mobility and Access Mitigation Measures

No adverse impacts on freight mobility and access have been identified, and no mitigation is proposed during East Link operations.

During East Link construction, adverse truck impacts would likely be associated with business deliveries on arterials and local streets near surface or tunnel construction activities. To minimize these impacts, Sound Transit would work specifically with affected businesses throughout construction to maintain access as much as possible to each business and coordinate with businesses during times of limited access.

During construction associated with I-90, SR 520, or I-405, Sound Transit would coordinate with freight stakeholder groups by providing construction information to WSDOT for use in the state's freight notification system. Sound Transit would provide information in a format required by WSDOT and compensate WSDOT for any direct costs associated with use of the freight notification system for East Link construction.

I.2.7 Navigable Waterways Mitigation Measures

No adverse impacts on navigable waterways have been identified, and no mitigation is proposed during East Link operations.

During construction of *Preferred Alternative E2*, Sound Transit would minimize any impacts on the navigability of the Sammamish River waterway crossing.

A Tribal fishery event on Lake Washington occurs in July. If any barging of construction equipment or materials is required, then Sound Transit would consult with the Muckleshoot Tribe to avoid conflict with the tribal fishing event.

I.3 Acquisitions, Displacements, and Relocations Potential Mitigation Measures

No adverse impacts related to acquisitions, displacements, and relocations have been identified, and no mitigation is proposed. As part of the project, Sound Transit would compensate affected property owners according to the provisions specified in Sound Transit's adopted Real Estate Property Acquisition and Relocation Policy, Procedures, and Guidelines. (Resolution #R98-20-1)Sound Transit would comply with provisions of the federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (Code of Federal Regulations [CFR] Title 49, Part 24), as amended, and the State of Washington's relocation and property acquisition regulations (WAC 468-100 and RCW 8.26). Benefits would vary depending on the level of impact, available relocation options, and other factors. Because of these compliance actions, no mitigation would be necessary.

I.4 Land Use Potential Mitigation Measures

No adverse impacts on land use have been identified, and no mitigation is proposed.

I.5 Economics Potential Mitigation Measures

No adverse economics impacts during East Link operations have been identified, and no mitigation is proposed. To minimize or limit impacts on businesses during construction, Sound Transit would dedicate staff to work specifically with affected businesses. Construction mitigation plans would be developed to address the needs of businesses during construction and could include, but are not limited to, the following elements:

- Provide a 24-hour construction telephone hotline.
- Provide business cleaning services on a case by case basis.
- Provide detour, open for business, and other signage as appropriate.
- Establish effective communications with the public through measures such as meetings and construction updates, alerts, and schedules.
- Promotion and marketing measures to help affected business districts maintain their customer base to the extent possible during construction.
- Maintain access as much as possible to each business and coordinate with businesses during times of limited access.
- Provide a community ombudsman.

Please refer to the arterials and local streets construction mitigation measures in Section I.2.4.3 for additional measures that would help mitigate economics impacts.

I.6 Social Impacts, Community Facilities, and Neighborhoods Potential Mitigation Measures

No adverse social, community facilities, and neighborhoods impacts have been identified, and no mitigation is proposed.

I.7 Visual and Aesthetic Resources Potential Mitigation Measures

No adverse impacts on visual and aesthetic resources during East Link operation have been identified for the *Preferred Alternatives*, and no mitigation is proposed.

During construction, Sound Transit would provide visual screening along the south side of Main Street for the 108th Station construction area for *Preferred Alternative C11A*, or along the south side of the tunnel portal construction area along Main Street for *Preferred Alternative C9T*. Visual screening would include construction of a solid barrier to screen ground-level views into the construction area from adjacent historic properties to the south. When possible, Sound Transit would preserve the existing vegetation. The decision whether to revegetate disturbed areas after construction would be determined based on future use of lands outside the trackway. Nighttime construction lighting would be shielded and directed downward to avoid light spillover onto adjacent sensitive uses.

I.8 Air Quality and Greenhouse Gases Potential Mitigation Measures

No adverse impacts related to air quality or greenhouse gases (GHGs) have been identified during East Link operation, and no mitigation is proposed.

For construction activities, Puget Sound Clean Air Agency (PSCAA) regulates particulate emissions (in the form of fugitive dust). To comply with the PSCAA policy of preventing air quality degradation, the following mitigation measures may be used as necessary and in accordance with standard practice to control particulate matter 10 microns or 2.5 microns or less in size (PM_{10} and $PM_{2.5}$, respectively) and emissions of carbon monoxide (CO) and oxides of nitrogen (NO_x) during construction of the project. Several of these measures would also reduce GHG emissions.

- Spray exposed soil with dust control agent as necessary to reduce emissions of PM_{10} and deposition of particulate matter.
- Cover all transported loads of soils and wet materials before transport, or provide adequate freeboard (i.e., space from the top of the material to the top of the truck) to reduce PM_{10} and deposition of particulate during transportation.
- Provide wheel washes to reduce dust and mud that would be carried off site by vehicles and to decrease particulate matter on area roadways.
- Remove the dust and mud that are deposited on paved, public roads to decrease particulate matter.
- Route and schedule high volumes of construction traffic to reduce congestion during peak travel periods and reduce emissions of CO, NO_x, and carbon dioxide equivalent (CO_2e) where practical.
- Require appropriate emission-control devices on all construction equipment powered by gasoline or diesel fuel to reduce CO and NO_X emissions in vehicular exhaust.
- Use well-maintained heavy equipment to reduce CO and NO_X emissions, which may also reduce GHG emissions.
- Cover, install mulch, or plant vegetation as soon as practical after grading to reduce windblown particulate in the area.

The following other readily available mitigation measures could potentially be used:

- Encourage contractors to employ emissions reduction technologies and practices for both on-road and off-road equipment/vehicles (e.g., retrofit equipment with diesel control technology and/or use of ultra-low sulfur diesel).
- Implement construction truck-idling restriction (e.g., no longer than 5 minutes).
- Locate construction equipment and truck staging zones away from sensitive receptors as practical and in consideration of other factors such as noise.

I.9 Noise and Vibration Potential Mitigation Measures

I.9.1 Noise Mitigation during Operation

Sound Transit is committed to minimizing noise levels at the source. This includes using only state-of-the-art vehicles equipped with wheel skirts to reduce noise. In addition, Sound Transit has committed to a maintenance program that includes periodic rail grinding or replacement, wheel truing or replacement, vehicle maintenance, and operator training, which all help to reduce noise levels along transit corridors. For noise impacts that still exist after these source noise treatments, noise mitigation measures would be provided that are consistent with Sound Transit's Light Rail Noise Mitigation Policy (Motion No. M2004-08). The FTA manual also defines when mitigation is needed and bases this on the impact's severity, with severe impacts requiring the most consideration. During final design, all impacts and mitigation measures will be reviewed for verification. During final design, if it is discovered that mitigation can be achieved by a less costly means or if the detailed analysis show no impact, then the mitigation measure may be eliminated or modified.

Sound Transit is currently investigating the use of non-audible warnings for gated and ungated at-grade crossings. If non-audible warning devices are found to be viable, this option could be used to reduce or eliminate bell noise at specific crossings. Where practical, grade separation of at-grade light rail crossings would also be considered to eliminate the need for bells or other audible warning devices. In addition, the use of acoustic bell shrouds would be examined during final design. These shrouds direct the bell noise at gated crossings to the intersection.

The mitigation proposed below follows Sound Transit policy. Table I-1 presents noise impacts and mitigation for the *Preferred Alternatives*, and additional details are presented in Attachment 1 to this appendix. Detailed tables of noise and vibration impacts in each segment are provided in Section 4.7 of the Final EIS. The Noise and Vibration Technical Report, Appendix H2, contains additional tables and parcel-scale maps indicating the location of impacts and proposed mitigation measures.

TABLE I-1
Summary of Potential Noise Impacts and Mitigation Measures – *Preferred Alternative*

Alternative	Connection Alternatives	Light Rail Impacts[a]		Traffic Noise Impacts[b]	Proposed Mitigation	Locations Considered for Sound Insulation
		Moderate	Severe			
Segment A

[a] **Moderate impact:** In this range of noise impact, the change in the cumulative noise level is noticeable to most people but might not be sufficient to cause strong, adverse reactions from the community. In this transitional area, other project-specific factors must be considered to determine the magnitude of the impact and the need for mitigation. These factors include the existing noise level, the projected level of increase over existing noise levels, the types and numbers of noise-sensitive land uses affected, the noise sensitivity of the properties, the effectiveness of the mitigation measures, community views, and the cost of mitigating noise to more acceptable levels.

Severe impact: Project-generated noise in the severe impact range can be expected to cause a substantial percentage of people to be highly annoyed by the new noise and represents the most compelling need for mitigation. Noise mitigation will normally be specified for severe impact areas unless there are truly extenuating circumstances that prevent it.

[b] These traffic noise impacts are based on the Federal Highway Administration 66 A-weighted decibel (dBA) equivalent continuous sound level (L_{eq}) impact criteria.

I.9.1.1 Transit Noise Mitigation

The potential mitigation options available for noise from transit operations on the East Link Project are primarily sound walls, special trackwork, lubricated curves, and residential building sound insulation. Sound walls are proposed where feasible and reasonable, as determined by Sound Transit based on specific site conditions. Sound walls would be located on the ground for at-grade profiles and on the guideway structure for elevated profiles. Sound walls are preferred because they are effective at reducing noise. For locations where there is a potential for traffic noise to be reflected off the sound walls, Sound Transit would propose to use absorptive treatments to remedy this issue.

A crossover track uses a frog (a rail-crossing structure) to allow the train to either cross over to another track or continue moving on the same track. A gap is provided on top of the frog so that vehicle wheels can pass regardless of which track is in use. With typical frogs, noise and vibration are generated when the wheels pass over the gap. Special trackwork, such as movable point or spring rail frogs, eliminates the gap between tracks at crossovers that causes noise and vibration at these locations.

Sound Transit is currently investigating the use of non-audible warnings for gated and ungated at-grade crossings. If non-audible warning devices are found to be viable, this option could be used to reduce or eliminate bell noise at specific crossings. Where practical, grade separation of at-grade light rail crossings would also be considered to eliminate the need for bells or other audible warning devices. If bells are used at gated crossings, the bells would be set at the minimum noise level that maintains a safe crossing. Finally, the use of acoustic bell shrouds would be examined during final design; the shrouds would direct the bell noise at gated crossings to the intersection.

When source mitigation measures or sound walls are infeasible or not entirely effective at reducing noise levels below the FTA impact criteria, then residential sound insulation would be evaluated and implemented at impacted properties where the existing building does not already achieve a sufficient exterior-to-interior reduction of noise levels. Many newer buildings, particularly in Downtown Bellevue, have good interior noise reduction and additional sound insulation may not be necessary.

Consistent with FTA methods and criteria, residential properties are considered “noise-sensitive” because people sleep there and “nighttime sensitivity to noise is assumed to be of utmost importance” (FTA, 2006). Accordingly, FTA analysis methods artificially increase measured existing noise and predicted project noise levels by 10 dBA (a perceived doubling of the noise level by most people) between 10:00 p.m. and 7:00 a.m. While noise measurements and impacts are analyzed at the exterior of residential properties, FTA methods clearly emphasize noise sensitivity for residential properties at night, because project noise could affect the ability of people to sleep. During the daytime hours, light rail noise levels are very similar to (in many cases less than) common noise levels in urban settings like Downtown Bellevue or along transportation corridors (like I-90, Bellevue Way, 112th Avenue SE, or I-405) where the predominant noise is from existing traffic (buses, trucks, and heavy traffic volumes). During those times of the day when outdoor uses are most frequent, noise from light rail would typically be less noticeable because of the higher ambient noise levels from traffic and other urban sources.

I.9.1.2 Traffic Noise Mitigation

Traffic noise impacts would be mitigated by sound walls, where determined to be reasonable and feasible. For locations with residual traffic noise impacts caused by the project, sound insulation might also be considered by Sound Transit. Use of FHWA or WSDOT funds to insulate residences from sound for traffic noise abatement is allowed only in specific situations. Federal regulation 23 CFR 772.13(c)(6), and WSDOT and FHWA policies and procedures limit sound insulation for traffic noise abatement to public use or nonprofit institutional structures and only in situations where a barrier is ineffective, unreasonable, and/or infeasible and interior noise levels are above the impact criteria. Sound insulation of residences is allowed only when noise impacts are severe (i.e., above 80 dBA exterior or above 60 dBA interior) and no other type of abatement is possible. In contrast, Sound Transit considers residential sound insulation for any noise impacts related to light rail projects if a sound wall is ineffective, unreasonable, and/or infeasible.

I.9.1.3 Segment A

In Segment A, the only potential noise impact resulting from *Preferred Alternative A1* would be near the transition from the Mount Baker Tunnel to the floating bridge structures. A light rail expansion joint would be required to allow for bridge movement; as a result, increased noise related to this joint could occur. If, after testing of the expansion joint prototype, the expansion joint near the Mount Baker Tunnel were determined to cause a noise impact, then mitigation would likely be a short, absorbent sound wall along the structure's side or absorbent material applied to the existing traffic safety barriers.

To reduce noise levels on the Rainier Station and Mercer Island Station platforms, Sound Transit would incorporate design measures to reduce freeway noise for patrons waiting at station platforms. (See Exhibits A-1-Na and A-1-Nb in Appendix H2, and Attachment 1 to this appendix.)

I.9.1.4 Segment B

In Segment B, mitigation measures under *Preferred Alternative B2M* when connecting to *Preferred Alternative C11A* would include a sound wall running continuously from the elevated section on I-90 to the retained cut section south of the Winters House along Bellevue Way SE. North of the 112th Avenue SE intersection, a sound wall is proposed at-grade, along the west side of the guideway, to just south of the Bellefield Residential Park Condominiums. A new sound wall would start along the west side of 112th Avenue SE and continue to the Segment C connection. The second sound wall would need to overlap with the first wall and would be effective at reducing traffic noise at the Bellefield Residential Park Condominiums. Openings in the wall would be required for vehicle and pedestrian access to the Bellefield Residential Park Condominiums, reducing the overall effectiveness. Supplemental sound insulation might also be required at approximately six multifamily and four single-family residences.

Noise mitigation for *Preferred Alternative B2M* when connecting to *Preferred Alternative C9T* would be identical to *Preferred Alternative B2M* connecting to *Preferred Alternative C11A* south of 112th Avenue SE. A second wall would be installed just north of the 112th Avenue SE intersection, on the west side of the guideway, to just north of the SE 8th Station. Openings would be required for pedestrian and vehicle access at SE 15th Street and SE 8th Street. Special trackwork would also be used for the crossovers. Approximately ten residences along 112th Avenue SE may also be provided with sound insulation to complete the noise mitigation measures if the sound walls are not effective at mitigating all impacts. (See Exhibits A-2-Na, A-2-Nb, A-3-Na, and A-3-Nb in Appendix H2, and Attachment 1 to this appendix.)

I.9.1.5 Segment C

In Segment C under *Preferred Alternative C11A*, mitigation would include a sound wall along the west side of the alignment beginning near SE 6th Street and continue as a sound barrier to 108th Avenue NE, just south of Main Street. The wall would be located near the tracks on the retained fill and elevated structure to the 108th Station. The sound wall barrier, along with special trackwork at the crossover along 112th Avenue SE, would mitigate all impacts along this section of the corridor. Sound walls and special trackwork for the crossover would also be used to mitigate impacts on the Coast Bellevue Hotel and Lake Bellevue Village Condominiums. Multi-family units located on Main Street, 108th Avenue NE, and NE 6th Street would be mitigated with sound insulation where necessary.

Noise mitigation under *Preferred Alternative C9T* would be similar to that proposed for *Preferred Alternative C11A* and would also include a sound wall along the west side of the alignment beginning near SE 6th Street continuing to the tunnel transition. The wall would likely be located on a retaining wall to the west of the tracks, with final placement determined during final design. This sound wall, along with special trackwork at the crossover along 112th Avenue SE, would mitigate all impacts along this section of the corridor. Sound walls and special trackwork at the crossover would also be used to mitigate impacts on the Coast Bellevue Hotel and Lake Bellevue Village Condominiums. Impacts located on SE 4th Street would be mitigated with a sound wall if possible, otherwise sound insulation would be employed for mitigation. Single- and multi-family units located on Main Street and NE 6th Street would be mitigated with sound insulation where necessary. (See Exhibits A-10-Na, A-10-Nb, A-12-Na, and A-12-Nb in Appendix H2, and Attachment 1 to this appendix.)

I.9.1.6 Segment D

There are no anticipated noise impacts for *Preferred Alternative D2A*, so no noise mitigation is proposed. (See Exhibits A-29-Na and A-29-Nb in Appendix H2, and Attachment 1 to this appendix.)

I.9.1.7 Segment E

Noise mitigation for *Preferred Alternative E2* would include sound walls along the elevated structures from SR 520, near NE 67th Place, to the at-grade transition by Marymoor Park. All remaining noise impacts would occur at highrise apartments on Cleveland Street and a hotel on NE 76th Street. If necessary, sound insulation along with special trackwork for the crossover would be used to mitigate these impacts. (See Exhibits A-34-Na and A-34-Nb in Appendix H2, and Attachment 1 to this appendix.)

I.9.1.8 Wheel Squeal

For curves of 600-foot radius or less, a trackside or vehicle-mounted lubrication system would be used to mitigate wheel squeal noise. For curves of 600- to 1,000-foot radius, the project would be designed to accommodate a lubrication system if wheel squeal occurs during operations.

I.9.2 Construction Noise Mitigation Measures

Several different jurisdictions are responsible for the regulation of construction noise. In addition, most daytime construction activities would be exempt from the noise control ordinances. When required, Sound Transit or its contractor would seek the appropriate noise variance from the local jurisdiction. Sound Transit would control nighttime construction noise levels by applying noise level limits, established through the variance process, and use noise control measures where necessary. The contractor would have the flexibility of either prohibiting certain noise-generating activities during nighttime hours or providing additional noise control measures to meet these noise limits. Noise control mitigation for nighttime or daytime work may include the following measures, as necessary, to meet required noise limits:

- Install construction site noise barrier wall by noise-sensitive receivers.
- During nighttime work, use smart back-up alarms that automatically adjusts or lowers the alarm level or tone based on the background noise level, or switch off back-up alarms and replace with spotters.
- Use low-noise emission equipment.
- Implement noise-deadening measures for truck loading and operations.
- Conduct monitoring and maintenance of equipment to meet noise limits.
- Use lined or covered storage bins, conveyors, and chutes with sound-deadening material.
- Use acoustic enclosures, shields, or shrouds for equipment and facilities.
- Install high-grade engine exhaust silencers and engine-casing sound insulation.
- Prohibit aboveground jack-hammering and impact pile driving during nighttime hours.
- Minimize the use of generators or use whisper quiet generators to power equipment.
- Limit use of public address systems.
- Use movable noise barriers at the source of the construction activity.
- Limit or avoid certain noisy activities during nighttime hours.

Pile driving might be required in Segments B, C, D, and E for construction of elevated profiles and bridges, and might also occur in areas of retained cuts in Segments C and D. To mitigate noise related to pile driving, the use of an augur to install the piles instead of a pile driver would greatly reduce the noise levels. If pile driving is necessary, the only mitigation would be to limit the time of day the activity can occur. Pile driving is not expected at most construction locations.

No segment-specific construction mitigation would be necessary for Segments A, B, or D during allowable daytime construction hours. In Segment C, at the tunnel staging areas near the Surrey Downs neighborhood, a mitigation measure that could be used includes construction of temporary noise barriers adjacent to the construction staging area. Construction in Segment E along SR 520 near NE 51st Street could require moving existing sound walls and, if practical, these would be replaced early in project construction.

I.9.3 Vibration Mitigation during Operation

Vibration and groundborne noise impacts that exceed FTA criteria warrant mitigation when determined to be reasonable and feasible. The locations requiring mitigation would be refined during final design. At some locations, however, light rail trackways or guideways would be within 20 feet of buildings and vibration mitigation would not be effective at reducing the vibration level to below the FTA criteria. At these locations, project design modification and additional information on affected buildings could eliminate these impacts. For instance, the type of building foundation might reduce vibration impacts and therefore, these residual impacts might be eliminated.

In addition, each building would need to be examined in detail to determine where the vibration-sensitive uses are located. For example, the side of a building nearest the proposed alternative might be a vibration-sensitive use. Buildings that are mixed use might not have sensitive uses on lower floors where impacts would occur, and the vibration would not be noticeable by the time it reached higher floors with sensitive uses, such as sleeping quarters. Outdoor-to-indoor vibration testing, which tests how the vibration changes from the soil outside to a sensitive space inside a building, would also help to refine the vibration projections at these locations. A summary of segment-specific vibration mitigation is provided below.

Options for mitigating vibration impacts include the following:

- Ballast mats, which consist of a pad made of rubber or rubberlike material placed on an asphalt or concrete base with the normal ballast, ties, and rail on top. The reduction in groundborne vibration provided by a ballast mat is strongly dependent on the vibration frequency content and the design and support of the mat.
- Resilient fasteners to provide vibration isolation between rails and concrete slabs for direct fixation track, typically on elevated structures or in tunnels. These fasteners include a soft, resilient element between the rail and concrete to provide greater vibration isolation than standard rail fasteners.
- Tire-derived aggregate (TDA), which consists of shredded tires wrapped with filter fabric that is added to the base below the track ties.
- Special trackwork, such as movable point or spring rail frogs, to eliminate the gap between tracks at crossovers that causes noise and vibration at these locations.
- Floating slabs, which consist of thick concrete slabs supported by resilient pads on a concrete foundation; the tracks are mounted on top of the floating slab. Although floating slabs are designed to reduce vibration at lower frequencies than ballast mats, they are extremely expensive and are rarely used, except in the most extreme situations. Most successful floating slab installations are in subways, and their use for at-grade track is less common and often not reasonable.

In Segment A, approximately 1,900 feet of vibration mitigation would be required along the Mount Baker Tunnel area to mitigate groundborne noise impacts at single-family homes along the top of the hillside. No other vibration impacts were identified in Segment A. (See Exhibits A-1-Va and A-1-Vb in Appendix H2.)

In Segment B, mitigation measures under *Preferred Alternative B2M* connecting to *Preferred Alternative C11A* or *C9T* would include up to 600 feet of vibration isolation at the Winters House. Standard vibration mitigation methods, such as resilient fasteners or ballast mats, would reduce the groundborne noise level at the Winters House, but might not eliminate the impact and would be determined in final design. A floating slab might be needed to eliminate the groundborne noise impact. (See Exhibits A-2-Va and A-2-Vb in Appendix H2.)

In Segment C, under *Preferred Alternative C11A*, vibration mitigation would be required at two single-family residences south of Main Street, three multifamily structures along 108th Avenue NE, and the elevated structure by the Coast Bellevue Hotel. Under *Preferred Alternative C9T*, vibration mitigation would also be required at the same two single-family residences and the Coast Bellevue Hotel identified under *Preferred Alternative C11A*, along with five single-family residences near the crossover on 112th Avenue SE. These five single-family residential impacts could be eliminated by the relocation of the crossover or the use of special trackwork to eliminate the gap. Both *Preferred Alternatives C9T* and *C11A* identified groundborne noise impacts at the Meydenbauer Center, a highly sensitive location, where impacts would be mitigated using ballast mats or resilient rail fasteners. (See Exhibits A-4-Va, A-4-Vb, A-5-Va, and A-5-Vb in Appendix H2.)

In Segment D, there would be no vibration or groundborne noise impacts with *Preferred Alternative D2A*, and no vibration mitigation is proposed.

In Segment E, with *Preferred Alternative E2*, an estimated 700 feet of vibration mitigation would be required along SR 520 to mitigate vibration impacts on three single-family residences. (See Exhibits A-13-Va and A-13-Vb in Appendix H2.)

I.9.4 Construction Vibration Mitigation Measures

In general, building damage from construction vibration would only be anticipated from impact pile driving close to buildings. If piling is more than 50 to 100 feet from buildings, or if alternative methods, such as auger cast piling or drilled shafts are used, then damage from construction would not be anticipated. Other sources of construction vibration, including potential ground improvement activities in Segment B such as construction of subsurface stone columns, could generate high enough vibration levels for localized damage to occur, depending on the soil type and distance between the source of vibration and the nearest building. In any locations of concern, preconstruction surveys would be conducted to document the existing condition of buildings, in case there was an issue during or after construction, and vibration monitoring would be implemented during construction to establish levels of vibration. Where levels of vibration exceed preset limits for damage, the contractor would be required to stop work and switch to alternate construction methods.

Measures to minimize short-term annoyance from groundborne vibration and groundborne noise from construction activities such as pile installation or compaction of earth fills include use of alternate methods that result in less vibration or noise, such as auger cast piles or drilled shafts in place of driven piles, or use of static roller compactors rather than vibratory compactors. The hours and duration of these types of activities can also be restricted to hours when vibrations and noise are less noticeable. Vibration monitoring would be considered for pile driving, tunnel construction, vibratory sheet installation, and other construction activities that have the potential to cause high levels of vibration.

Sound Transit would minimize vibration at the Winters House during construction and prevent damage or limit to minor cosmetic damage by using the following methods:

- Install monitoring equipment and monitor vibration during construction.
- Place limits on the construction vibration levels for the contractor, with the contractor selecting one or more of the following measures or other measures of equivalent effectiveness to limit construction:
  - Using auger-drilling methods
  - Using low vibration or nonimpact methods of installing steel casing required to support construction of drilled shaft or secant pile foundations
  - Using slurry confinement (i.e., temporarily filling the cavity with slurry material to replace the removed soil)
  - Underpinning foundation and employing structural support or soil stabilization if needed
  - Adjusting excavation methods based on monitoring results
  - Installing a shallow temporary supporting wall
  - Monitoring vibration levels associated with equipment to be used for the East Link Project at other construction sites with similar soils before project construction to determine which vibration-minimization method would be necessary
  - Beginning vibration-inducing construction at the site at points more distant from the Winters House to enable the contractor to determine which vibration-minimization method would be necessary
- Photograph and inventory the building to establish existing conditions to determine if any damage is caused by construction, and repair the building in a manner consistent with the U.S. Department of the Interior Secretary's standards for treating historic properties.

I.10 Ecosystem Resources Potential Mitigation Measures

I.10.1 Potential Mitigation for Operational Impacts

I.10.1.1 High-Value Habitat

Project impacts on high-value wildlife habitats regulated by local agencies would be mitigated with habitat replacement or enhancement. The type of habitat to be established would depend on the affected species. The type of habitat to be replaced and mitigation ratios would be determined through discussions with federal, state, and local permitting agencies during final design and project permitting. Sound Transit would adhere to local ordinances regarding tree replacement ratios.

I.10.1.2 Wetlands and Wetland Buffers

Sound Transit has committed to achieving no net loss of wetland function and area on a project-wide basis. Sound Transit would apply the interagency wetland mitigation guidance prepared by Ecology, United States Army Corps of Engineers (USACE), and United States Environmental Protection Agency (EPA) (2006).

Compensatory mitigation sites would be identified within the same drainage basin and compensate for lost functions in-kind. The specific compensatory mitigation sites for unavoidable impacts on wetlands would be determined during final design and project permitting. Compensatory mitigation-to-impact ratios for replacement of wetlands would comply with the requirements of the local critical area ordinances (CAOs) and the interagency wetland mitigation guidance (Ecology et al., 2006).

During field work, Sound Transit determined there are several opportunities for wetland mitigation within the study area close to potentially impacted areas that are expected to meet required mitigation ratios. Additional compensatory mitigation may be required for impacts on existing wetland mitigation sites and would be determined during final design and project permitting.

There are no existing approved mitigation banks in the Kelsey Creek subbasin. However, it is possible that a bank could become certified in the project study area in the future and could be used to mitigate project impacts.

I.10.1.3 Aquatic Habitat

On Sturtevant Creek at the Hospital Station, where realignment of the stream channel would be required (with *Preferred Alternatives C11A* and *C9T*), Sound Transit would reconstruct the new channel with natural stream habitat features. Riparian habitat functions would be improved with native riparian plantings. This reach is currently lacking shade. The newly shaded reach would help lower stream temperatures in the downstream reaches that support salmonids. Specific requirements and details of these measures would be established during final design and project permitting.

For mitigation for the increased culvert length on the Unnamed Tributary to Kelsey Creek (with *Preferred Alternative D2A*), Sound Transit proposes to coordinate with the City of Bellevue to find and develop in-stream habitat improvements on the downstream reaches of Goff Creek in coordination with the City of Bellevue’s larger plans to restore and daylight the creek.

I.10.2 Potential Mitigation for Construction Impacts

I.10.2.1 High-Value Habitat

Areas disturbed in the construction staging areas would be revegetated with native vegetation as soon as possible following construction.

Sound Transit would update its survey of bird nests during final design. If a bald eagle nest is found within one-half mile of the proposed construction limits, a bald eagle management plan would be prepared. Under the Migratory Bird Treaty Act (MBTA), nesting migratory bird nests cannot be destroyed during the breeding season. Sound Transit would consult with the U.S. Fish and Wildlife Service on methods to implement during construction to avoid impacts on migratory birds consistent with the MBTA and the Bald and Golden Eagle Protection Act. Such methods would include clearing in the Mercer Slough buffer outside the nesting season for migratory birds.

I.10.2.2 Wetlands and Wetland Buffers

Wetlands and wetland/stream buffer areas disturbed by construction would be protected by best management practices (BMPs) and revegetated as soon as possible after construction. BMPs would be implemented to avoid construction impacts on wetlands and wetland buffers.

Sound Transit would conduct detailed site surveys to establish existing topography and conduct hydrologic monitoring to restore topography. Restoration would include soil amendment and vegetation replacement.

I.10.2.3 Aquatic Habitat

BMPs would be implemented to avoid construction impacts on aquatic resources. Except for the in-water construction in Lake Washington, any in-water work would be isolated from adjacent waters using a coffer dam or other suitable technique. Such isolation is not necessary in Lake Washington due to the type of work done there (welding or bolting metal jackets together).

In-water work would be conducted during approved in-water construction windows. Where ESA-listed species might be present, stream crossings would not require in-water work and the project would not install infrastructure below the ordinary high water mark (OHWM). Disturbed or temporarily cleared riparian vegetation would be replanted with suitable native species. The proposed channel relocation of Sturtevant Creek adjacent to the Hospital Station would follow guidelines found in the Integrated Streambank Protection Guidelines manual (WDFW et al. , 2002) and other current stream design documents. If over-water construction is conducted over the Sammamish River (with *Preferred Alternative E2*) during the migratory period of Endangered Species Act (ESA)-protected species, nighttime lighting would be shielded from the waters below.

Sound Transit would consult with the Tribes to avoid impacting Tribal fisheries from construction work in Lake Washington, barge/boat transit through the Lake Washington ship canal, or through approaches to the Ballard Locks.

I.11 Water Resources Potential Mitigation Measures

A number of regulatory requirements for addressing water resource impacts would be met by the East Link Project design. In addition to these project components, the mitigation measures discussed below would also be applied.

During final design, opportunities for regional management of project stormwater and on-site control of stormwater runoff would be explored. The project design team would work with local jurisdictions to identify opportunities to incorporate low-impact development features into the project. Stormwater management and treatment principles of Low-Impact Development (LID) will be favored over “traditional” stormwater treatment. For *Preferred Alternative B2M*, the retained cut constructed near Mercer Slough would be sealed to prevent groundwater from entering the retained cut but would allow groundwater to flow downgradient beneath the cut. This would maintain the existing groundwater flow toward the Slough and sustain downgradient wetlands and other surface water features.

For *Preferred Alternative D2A*, the Unnamed Tributary to Kelsey Creek would be relocated into a new 24-inch-wide storm drain. The stream would remain in the existing storm drain until a new storm drain is constructed. Rerouting the tributary would occur during the summer when flows in the stream do not typically exist or are extremely low.

I.12 Energy Impacts Potential Mitigation Measures

No adverse energy impacts have been identified, and no mitigation is proposed.

I.13 Geology and Soils Potential Mitigation Measures

No adverse geology and soils impacts from East Link operation have been identified, and no mitigation is proposed.

Engineering design standards and BMPs would be used to avoid and minimize potential construction impacts. Based on the review of potential impacts, the design and construction process would address seismic hazards, soft soils, settlement, steep-slope hazards, landslide hazards, erosion and sediment control, vibrations, and groundwater.

I.14 Hazardous Materials Potential Mitigation Measures

In order to mitigate potential impacts from all potential sites, including railroad corridor and crossings, Sound Transit would perform a level of environmental due diligence appropriate to the size and presumed past use of the property at all properties along the corridor before they are acquired. Phase 2 Environmental Site Assessments would be conducted where appropriate. Where known hazardous sites are present, Sound Transit would be responsible for the remediation of any contaminated soil and groundwater, including those previously unknown and found during construction. To the extent practical, Sound Transit would limit construction activities that might encounter contaminated groundwater or contaminated soils.

I.15 Electromagnetic Fields Potential Mitigation Measures

Standard design measures are necessary to protect underground utilities against stray currents. These measures would be developed and implemented in consultation with utility owners during final design.

The I-90 section of the project would incorporate measures to prevent stray electrical current from corroding the steel components of the I-90 bridge, as agreed to with WSDOT.

I.16 Public Services Potential Mitigation Measures

No adverse operational public services impacts have been identified, and no mitigation is proposed.

Sound Transit would coordinate with public service providers before and during construction to maintain reliable emergency access and alternative plans or routes to minimize delays in response times. Sound Transit would also coordinate with solid waste and recycling companies and schools if any rerouting of collection or bus routes would need to occur. Postal collection and delivery and solid waste and recycling collection would be maintained at all addresses.

I.17 Utilities Potential Mitigation Measures

No adverse impacts on utilities during light rail operation are anticipated, and no mitigation is proposed. The project includes design measures and coordination with utility providers and the public to minimize impacts on utilities during light rail construction. These measures would include potholing and preconstruction surveys to identify utility locations. Sound Transit would continue to work with utility providers to minimize any potential service interruptions and perform outreach to notify the community of potential service interruptions.

I.18 Historic and Archaeological Resources Potential Mitigation Measures

I.18.1 Archaeological Sites

Sound Transit would conduct preconstruction surveys of selected areas that it would acquire and that have been identified as high potential for cultural resources. Using information from the preconstruction survey, an archaeological resources monitoring and treatment plan (ARMTP) would be prepared to provide additional information that would guide archaeological monitoring during East Link construction. The plan would contain procedures for the inadvertent discovery of archaeological deposits and human remains. The Federal Transit

Administration (FTA) and Sound Transit will consult with Washington Department of Archaeology and Historic Preservation (DAHP) and the Muckleshoot, Snoqualmie, Suquamish, Tulalip, and Duwamish Tribes to review the plan. If prehistoric or historic-period archaeological sites are encountered during construction, Sound Transit would follow the protocols established in the ARMTP and consult with DAHP, interested Indian Tribes, and other interested parties as appropriate.

I.18.2 Historic Buildings and Structures

Through consultation with local jurisdictions and interested parties, minimization measures have been developed and incorporated into the project. FTA has determined in consultation with the State Historic Preservation Office (SHPO), that the project would have an adverse effect, resulting from *Preferred Alternatives B2M and C11A* potential impacts on the Winters House and the potential Surrey Downs historic district. Mitigation would consist of the preparation of a Memorandum of Agreement. A copy of the Draft MOA is provided in Attachment 2 to this appendix.

I.19 Parkland and Open Space Potential Mitigation Measures

Sound Transit would restore disturbed park and open space to pre-project conditions after construction in cooperation with the resource owner. This would include landscaping, paths, and any built features of the park and trail resources. Other measures to mitigate affected parks and open space include providing replacement lands, financial compensation, or park enhancement, where appropriate. During construction, pedestrian access to parks and trails would be routed to the remaining open portions of the facilities. Dust from construction would be mitigated using dust control measures described in Section 4.6, Air Quality. Visual and noise impacts would be mitigated using measures described in Section 4.5, Visual and Aesthetic Resources, and Section 4.7, Noise and Vibration.

As part of the Section 4(f) process, Sound Transit has consulted with the Cities of Seattle, Mercer Island, Bellevue, and Redmond and with King County about potential impacts on parks under their jurisdiction and possible mitigation measures. With the exception of the City of Bellevue, the agencies with jurisdiction over parklands have concurred regarding the scope of potential project impacts and associated mitigation measures. The cities of Seattle, Mercer Island, Redmond, and King County have provided 4(f) letters of concurrency, which are included in Appendix D. Table I-2 includes the mitigation measures that are consistent with the letters of 4(f) concurrency for each affected recreational resource and also includes proposed mitigation for City of Bellevue park impacts. Not all mitigation measures would be necessary or implemented where multiple mitigation options are described in the Table I-2.

Sound Transit has also consulted with the Washington RCO and the National Park Service regarding potential LWCF Section 6(f) and RCO funded property conversion. Appendix D discusses converting these properties and requirements regarding replacement properties.

TABLE I-2
Potential Mitigation for Identified Section 4(f)/6(f) Impacts

Facility Name	Jurisdiction	Potential Mitigation	Associated Alternatives
Segment A, Interstate 90			
Benvenuto Viewpoint	WSDOT, City of Seattle	**Permanent:** ▪ Design station entrance to be compatible with the City's park design. **Temporary:** Restore temporarily disturbed area to existing conditions.	*Preferred Alternative A1*
Park on the Lid	WSDOT	**Permanent:** ▪ Design station entrance to be compatible with the surrounding the park. **Temporary:** ▪ Restore temporarily disturbed areas to existing conditions	*Preferred Alternative A1*

TABLE I-2 CONTINUED
Potential Mitigation for Identified Section 4(f)/6(f) Impacts

Facility Name	Jurisdiction	Potential Mitigation	Associated Alternatives
Segment B, South Bellevue			
Mercer Slough Nature Park	City of Bellevue	**Permanent:** ▪ Acquire replacement land pursuant to Washington State Recreation and Conservation Office (RCO) and Section 6(f) requirements that would be consistent with the natural character of the park. ▪ Have an option to preserve existing vehicle access to Sweylocken boat ramp. **Temporary:** ▪ Provide financial compensation for temporary use of land as agreed to with the City. ▪ Restore temporarily disturbed areas to existing conditions. ▪ Provide temporary parking for users off Bellevue Way and south of the South Bellevue Park-and-Ride or as agreed to with the City. ▪ Relocate blueberry farm retail use during construction. ▪ Maintain blueberry farm operations ▪ Relocate Eastside Heritage Center during construction. ▪ Maintain access or provide detours for trails, and maintain access to Sweylocken boat ramp.	*Preferred Alternative B2M*
Segment C, Downtown Bellevue			
Surrey Downs Park	City of Bellevue	**Permanent:** ▪ Replace impacted acreage with the acquired properties north of the park along 112th Avenue SE and provide landscaping. ▪ Design treatments of the retaining wall and fence along 112th Avenue SE in consultation with the City. ▪ Design and construct a U-turn on 112th Avenue SE at SE 8th Street. Prepare conceptual layout for two northbound-to-southbound U-turn options—one at SE 6th Street and one at Main Street—to accommodate those coming from the south who would want to turn left into the park; the City and Sound Transit would pick one that Sound Transit would design and construct. ▪ Coordinate with the City of Bellevue and community to revise the Surrey Downs Master Plan to address the impacted areas. **Temporary:** ▪ Provide financial compensation for the temporary use of land as agreed with the City. ▪ Restore the temporarily disturbed area with landscaping in accordance with the Surrey Downs Master Park Plan. ▪ Maintain overall access to the park by providing trail and sidewalk connectivity through detours in coordination with the City. ▪ Maintain public parking and access for scheduled baseball/soccer fields (spring, late summer, and fall). ▪ Provide a barrier or fence adjacent to the main construction area. ▪ Improve south driveway to increase traffic flow prior to closure of the north driveway.	*Preferred Alternative C11A* connecting from *Preferred Alternative B2M*
		Permanent: ▪ Replace impacted acreage with the acquired properties north of the park along 112th Avenue SE, and provide landscaping. ▪ Design treatments of the retaining wall and fence along realigned SE 4th Street in consultation with the City. ▪ Coordinate with the City of Bellevue and community to revise the Surrey Downs Master Plan to address the impacted areas. **Temporary:** ▪ Provide financial compensation for the temporary use of land as agreed with the City. ▪ Restore the temporarily disturbed area with landscaping in accordance with the Surrey Downs Master Park Plan. ▪ Maintain overall access to the park by providing trail and sidewalk connectivity through detours in coordination with the City. ▪ Maintain public parking and access for scheduled baseball/soccer fields (spring, late summer, and fall). ▪ Provide a barrier or fence adjacent to the main construction area. ▪ Improve south driveway to increase traffic flow prior to closure of the north driveway.	*Preferred Alternative C9T* connecting from *Preferred Alternative B2M*

TABLE I-2 CONTINUED
Potential Mitigation for Identified Section 4(f)/6(f) Impacts

Facility Name	Jurisdiction	Potential Mitigation	Associated Alternatives
NE 2nd Pocket Parks	City of Bellevue	**Permanent:** • One, or a combination of the following, as agreed to with the City: — Provide financial compensation as agreed to with the City. — Provide replacement land with an equivalent portion of the project's staging area located on the northeast quadrant of the park. — Enhance entire northwest quadrant of the park as a public plaza in conjunction with the station entrance. **Temporary** ▪ Provide financial compensation for the temporary use of land as agreed to with the City. ▪ Restore temporarily disturbed park area to existing conditions. ▪ Preserve pedestrian access to southern park quadrants.	*Preferred Alternative C9T* connecting from *Preferred Alternative B2M*
Segment D, Bel/Red-Overlake			
No parks affected			
Segment E, Downtown Redmond			
Marymoor Park	King County	**Permanent:** ▪ Acquire replacement recreation land equal in value and function to offset the light rail use within the park property. ▪ Evaluate noise impacts on park uses in place, when Segment E is funded, consistent with Federal Transit Administration noise analysis methods and criteria when design is advanced. **Temporary:** ▪ Mitigate temporarily disturbed park lands pursuant to RCO regulations. ▪ Provide financial compensation for temporary use of land outside the light rail right-of-way for construction; restore parkland following construction.	*Preferred Alternative E2* and E2 - Redmond Transit Center Design Option
Bear Creek Trail	City of Redmond	**Permanent:** ▪ Reroute trail during construction, restore disturbed trail area after construction, replace trees. **Temporary:** ▪ Provide financial compensation for the temporary use of land during construction, as agreed with the City. ▪ Maintain access or provide detours for trail during construction. ▪ Restore temporarily disturbed area to existing conditions.	*Preferred Alternative E2*
Redmond Central Connector Trail and Park Corridor	City of Redmond	**Permanent:** ▪ Possible permanent reroute of trail, and replace affected park amenities and associated vegetation as agreed to with the City. **Temporary:** ▪ Provide financial compensation for the temporary use of land during construction as agreed to with the City. ▪ Maintain access or provide detours for trail during construction. ▪ Restore temporarily disturbed area to existing conditions.	*Preferred Alternative E2*
Sammamish River Trail	King County	**Permanent:** ▪ Acquire replacement recreation land equal in value to offset the light rail within the trail right of way per RCO requirements. ▪ Locate guideway columns outside trail clear zone as practical. **Temporary:** ▪ Provide financial compensation for temporary use of land outside of the light rail right-of-way for construction. ▪ Reroute and restore trail to King County standards and specifications during and after construction.	*Preferred Alternative E2*
East Lake Sammamish Trail	King County	**Permanent:** ▪ Provide financial compensation for the light rail use of the trail right-of-way. **Temporary:** ▪ Provide financial compensation for temporary use of land outside of the light rail right-of-way during construction. ▪ Reroute and restore trail to King County standards and specifications during and after construction.	*Preferred Alternative E2*

Draft Memorandum of Agreement

DRAFT

MEMORANDUM OF AGREEMENT

AMONG

THE FEDERAL TRANSIT ADMINISTRATION,

WASHINGTON STATE HISTORIC PRESERVATION OFFICER,
AND THE CENTRAL PUGET SOUND REGIONAL TRANSIT AUTHORITY

Implementing

Section 106 of the National Historic Preservation Act

for the

EAST LINK LIGHT RAIL TRANSIT PROJECT
IN THE STATE OF WASHINGTON

DRAFT

WHEREAS, the Central Puget Sound Regional Transit Authority (Sound Transit) proposes to construct and operate the East Link Light Rail Transit Project (Project), an extension of its electric light rail transit system, that will connect the cities of Seattle, Mercer Island, Bellevue, and Redmond, crossing Lake Washington in the center lanes of Interstate 90 (I-90) and operating in a dedicated right-of-way between Seattle and Redmond; and

WHEREAS, the Federal Transit Administration (FTA), the responsible Federal agency, has determined that the Project is an undertaking, as defined in Title 36 Code of Federal Regulations (CFR) §800.16(y), and thus is subject to review under Section 106 of the National Historic Preservation Act (NHPA), 16 U.S.C. §470f and its implementing regulations, 36 CFR Part 800; and

WHEREAS, Sound Transit is the designated applicant responsible for obtaining the necessary approvals and permits to undertake the Project; and

WHEREAS, FTA and Sound Transit have consulted with the Washington State Historic Preservation Officer (SHPO), interested and affected Indian tribes, and other parties with a demonstrated interest in the effects of the Project on historic properties in accordance with Section 106 of the National Historic Preservation Act (16 USC 4701) and its implementing regulations (36 CFR Part 800.2); and

WHEREAS, FTA and Sound Transit, in consultation with SHPO, have determined the appropriate area of potential effects (APE) for the Project and conducted cultural resource studies constituting a reasonable and good faith effort to identify historic properties and archaeological resources within the APE pursuant to 36 CFR §800.4; and

WHEREAS, the APE and potential historic properties within the APE are described in the Sound Transit East Link Project Historic and Archaeological Resources Technical Report, along with a description and map of the Project; and

WHEREAS, the cultural resource studies resulted in the identification of 16 properties within the APE listed in or eligible for listing in the National Register of Historic Places (NRHP), including a neighborhood (Surrey Downs) that is potentially eligible for listing in the NRHP; and

WHEREAS, as federally recognized tribes, the Muckleshoot Indian Tribe, the Snoqualmie Indian Tribe, the Suquamish Indian Tribe, the Tulalip Tribes of the Tulalip Reservations, and the Confederated Bands and Tribes of the Yakama Nation (the Tribes) have been consulted about the Project and have been invited to concur with this Agreement; and

WHEREAS, the Duwamish Tribal Services (a non-profit organization) has been consulted about the Project and has been invited to concur with this Agreement; and

WHEREAS, FTA and Sound Transit have completed a traditional cultural properties (TCP) archival inventory of the APE using secondary sources and information available in the public domain, and identified no property of cultural interest to the Tribes ; and

WHEREAS, FTA and Sound Transit have consulted about the project with the cities of Seattle, Mercer Island, Bellevue, and Redmond, King County, Washington State Department of Transportation, Federal Highway Administration, and US Army Corps of Engineers, and have invited those entities to concur with this Agreement; and

WHEREAS, FTA and Sound Transit have coordinated the investigations, studies and consultations described above required under Section 106; and

WHEREAS, FTA and Sound Transit have determined that the Project will have an adverse effect, which results from a potential impact on the Winters House, and on the potentially eligible Surrey Downs Historic District, and has the potential to have an impact on undiscovered archaeological resources; and

WHEREAS, FTA and Sound Transit carried out consultations with SHPO, interested and affected Indian tribes, and other consulting parties to identify measures to resolve impacts pursuant to 36 CFR §800.6, resulting in development of this Agreement; and

NOW, THEREFORE, FTA, SHPO, and Sound Transit agree that the Project shall be implemented in accordance with the following stipulations to satisfy FTA's Section 106 responsibilities, and they further agree that FTA shall require that the following terms and conditions be carried out.

STIPULATIONS

FTA and Sound Transit shall implement the following terms and conditions in a timely manner and with adequate resources in compliance with the NHPA (16 USC 470).

DRAFT

During the environmental review for this Project, conceptual engineering plans and conceptual station designs were reviewed for potential impacts on identified historic properties. These conceptual plans and designs, and the potential impacts they describe, are included in the East Link Light Rail Transit Project Final Environmental Impact Statement (FEIS July 2011) and the Archeological and Historic Resources Technical Report to the FEIS. The following stipulations will govern future design, construction, and operation of the Project.

I. WINTERS HOUSE

A. Sound Transit will perform a conditions assessment of the Winters House building to establish existing conditions, including exterior and interior inspection.

B. Sound Transit will install vibration and settlement monitoring devices before undertaking ground-disturbing construction sufficient to provide the necessary monitoring and measurements to alert Sound Transit. Where called for, Sound Transit will adjust construction methods as needed based on monitoring results.

C. Sound Transit will use specific vibration and settlement-reducing construction methods, to be determined by Sound Transit during final design and construction.

D. If warranted, Sound Transit will build a construction barrier around the Winters House building to minimize damage and minimize dust during construction. This will be determined by Sound Transit during final design and construction.

E. Sound Transit will apply dust control measures during construction to minimize dust. After construction, in consultation with SHPO, Sound Transit will clean the outside of the Winters House building and windows in a manner sensitive to the historic property.

F. The Winters House will be closed during construction and Sound Transit will temporarily relocate the tenant. For the duration of the time the Winters House is closed, Sound Transit will provide information to the public regarding how to access the Eastside Heritage Center during construction.

G. If any physical damage occurs to the Winters House building as a result of the Project, Sound Transit, in consultation with SHPO, will make any necessary repairs consistent with U.S. Secretary of the Interior's Standards for the Treatment of Historic Properties.

H. Sound Transit will install standard methods of vibration reduction, such as resilient fasteners or ballast mats, to reduce groundborne noise below FTA impact criteria. A floating slab will be incorporated in the project, if necessary, to eliminate groundborne noise and vibration impacts. This will be determined by Sound Transit in consultation with FTA during final design and construction.

I. Within six months after construction of the Project is completed, Sound Transit will landscape the area of property between the front (west elevation) of the Winters House and Bellevue Way SE to more closely reflect the landscaping of the historic period, in consultation with the City of Bellevue and SHPO. Sound Transit will preserve, as practical, historic period plants that will be affected by Project construction.

DRAFT

J. Sound Transit will provide interpretive signage on or near the Winters House property in consultation with the City of Bellevue.

II. POTENTIAL SURREY DOWNS HISTORIC DISTRICT

A. To minimize construction impacts, the following minimization measures will be incorporated into the Project during construction adjacent to properties that contribute to the potential Surrey Downs Historic District:

1. Before construction begins, Sound Transit will install a solid construction barrier south of Main Street between the area of construction activity and adjacent contributing properties.

2. During construction, Sound Transit will comply with the City of Bellevue's Noise Ordinance. Other construction impact minimization measures, including dust control, will be implemented as needed.

3. Sound Transit will remove the construction barrier and will install landscaping along the south side of the guideway south of Main Street within six months after completion of construction.

4. As practical, Sound Transit will preserve the evergreen trees located between the contributing historic properties and proposed project south of Main Street and east of 108th Avenue SE.

5. Reasonable mitigation measures shall be employed for construction-related activities occurring on adjacent property used by Sound Transit for "construction staging" to address noise, dust, visual and other such impacts in recognition of the neighboring residential setting.

B. To minimize impacts during operation, the following measures will be incorporated into the Project

1. Sound Transit will install a permanent sound barrier, which may include a berm and/or wall, south of the light rail track along Main Street to prevent noise impacts on contributing properties within the potential Surrey Downs Historic District. The SHPO will be consulted for sound barrier design prior to its construction.

2. Sound Transit will install landscaping along the south side of the guideway south of Main Street to provide a buffer for the boundary of the potential Surrey Downs Historic District where noncontributing properties would be removed for the Project.

III. ARCHAEOLOGY

A. Project archaeologists who meet the Secretary of Interior's professional standards will conduct additional subsurface testing before construction as outlined in the Archaeological Survey Strategy (which is included in the Historic and Archaeological Technical Report).

B. An Archaeological Resources Monitoring and Treatment Plan or an Unanticipated Discovery Plan will be prepared before construction to provide additional information and protocols that will guide archaeological monitoring work during Project construction.

DRAFT

IV. DISPUTE RESOLUTION

A. FTA, Sound Transit, and SHPO are signatories to this agreement and are the parties who are authorized to address and informally resolve disagreements concerning the implementation of this Agreement.

B. If informal resolution cannot be achieved, any signatory to this Agreement may object in writing to FTA or Sound Transit regarding any action carried out or proposed with respect to implementation of this Agreement. The agency receiving the objection shall, within ten working days, initiate consultation with the objecting party to resolve the objection.

C. If after initiating such consultation FTA or Sound Transit determines that the objection cannot be resolved through consultation, FTA shall forward all documentation relevant to the objection to the Advisory Council on Historic Preservation (ACHP), including the agency's proposed response to the objection.

D. Within thirty calendar days after receipt of all pertinent documentation, ACHP shall exercise one of the following options:

1. Advise FTA that ACHP concurs in the agency's proposed response to the objection, whereupon FTA will respond to the objection accordingly; or
2. Provide FTA with recommendations, which the agency shall take into account in reaching a final decision regarding its response to the objection; or
3. Notify FTA that the objection will be referred for comment pursuant to 36 CFR §800.7(a)(4), and proceed to refer the objection and comment.

E. FTA shall take the resulting comment into account in accordance with 36 CFR §800.7(c)(4), with reference only to the subject of the specified dispute; FTA's responsibility to ensure that all actions under this Agreement that are not the subjects of the dispute are carried out will remain unchanged.

V. AMENDMENT AND TERMINATION

A. FTA, Sound Transit, and SHPO are signatories to this agreement and are the parties who are authorized to terminate it by providing 30 calendar days written notice to the other parties. If requested by a signatory, the signatories may meet during the period prior to termination to seek agreement on amendments or other actions that would avoid termination.

B. In the event of termination, FTA shall comply with 36 CFR 800 with regard to all remaining actions under this Agreement.

C. If FTA or Sound Transit proposes to modify this Agreement in a manner that alters the resolution of adverse effects of historic properties, the modified Agreement must be signed by all signatories.

DRAFT

VI. CONSULTATION UNDER SECTION 106

A. FTA notified the ACHP of a potential adverse effect of the Project on properties listed in or eligible for listing in NRHP, affording ACHP an opportunity to comment and/or participate in resolving adverse effects. ACHP has declined to participate in the consultation to resolve adverse effects. The executed MOA will be filed with the ACHP, pursuant to 36 CFR 800.6(b)(I)(iv), when signed by the parties below.

B. Execution and implementation of this Agreement is evidence that FTA and Sound Transit have taken into account the effects of the Project on historic properties and afforded the ACHP an opportunity to comment on those effects, and is evidence that FTA and Sound Transit have complied with the consultation requirements under Section 106.

VII. EXECUTION

A. Unless terminated, this MOA shall remain in effect from the date of execution until FTA determines that the terms of this MOA have been satisfactorily fulfilled. Upon such determination, this MOA shall terminate, and FTA shall provide SHPO with written notice of the determination and termination.

B. The undersigned official representatives of the parties affirm and concur with the agreement and enter into this agreement on behalf of their respective parties. Each party represents that the person executing this agreement on its behalf is duly authorized to execute this agreement.

VIII. MISCELLANEOUS

This MOA creates no right of action for any signatory to this agreement or any other party.

Introduction

Sound Transit is studying an extension of the region's light rail system from downtown Seattle east to Bellevue and Redmond (Figure 1). The East Link Project would connect the Eastside's biggest population and employment centers, serving 45,000 – 50,000 daily riders, on one of the region's most congested travel corridors. Sound Transit is currently preparing a Final Environmental Impact Statement (Final EIS) as well as preliminary engineering drawings for the approximately 14-mile extension.

During the past three years, Sound Transit has developed numerous route and station alternatives for the portion of the route that would serve downtown Bellevue—Segment C. The City of Bellevue (the City) has expressed a preference for a tunnel route, in part to avoid the traffic conflicts that would affect the reliability of the light rail system and the downtown street network. The Sound Transit Board favors an at-grade profile because it would be cost-effective and directly serve the downtown Bellevue core without the visual effects of an elevated guideway. In May 2009, after the completion of the East Link Project Draft Environmental Impact Statement (Draft EIS), the Sound Transit Board identified a preferred alternative that included an at-grade couplet in downtown Bellevue running on 108th Avenue NE and 110th Avenue NE (C4A). The Sound Transit Board also identified a tunnel on 108th Avenue NE (C3T) for future consideration as preferred and if additional funding is found. Since then, both Sound Transit and the City have experienced significant revenue pressure from declining sales tax receipts. Sound Transit is examining ways to reduce the capital cost of all of its projects, including East Link.

At the time of this report, the City is engaged with the downtown stakeholders and Sound Transit to identify potential funding for a tunnel alternative. Recognizing their mutual interest in developing an alternative for downtown that effectively serves the downtown, and has the support of Bellevue's residents and businesses, Sound Transit and the City instructed their respective staffs to develop information on a range of new alternatives, both tunnel and non-tunnel, and to prepare a report that clearly describes the characteristics of each of those designs.

The Sound Transit Board intends to reconsider the preferred alternative for downtown Bellevue by spring 2010; if this deadline is not met, the schedule for funding and implementation, including final design and construction, will be delayed. As East Link is an essential element of the Sound Transit 2 Plan (ST2 Plan), project delay is not a desirable outcome.

In November 2009, staff from the City of Bellevue and Sound Transit met and jointly refined three new alternatives based on suggestions from Sound Transit peer review and value analysis panels – two at-grade alternatives and one tunnel alternative. In addition, the Sound Transit Board agreed to evaluate an elevated profile alternative at the request of the Bellevue City Council. The City and Sound Transit agreed to evaluate each alternative based upon a set of mutually agreed-upon criteria. Members of both staffs agreed that a visual simulation of each alternative would be helpful in describing how each alternative would look and operate in downtown Bellevue. The evaluation has been completed through a collaborative process where staff from Sound Transit and the City worked closely with support from the consultant team led by CH2M HILL.

The identification of a single Segment C alternative for the project preferred alternative will be made by the Sound Transit Board of Directors after a review of input from the City of Bellevue and community stakeholders. Sound Transit staff and consultants will then complete preliminary engineering and environmental review for the project. Future project phases include final design, permitting, and construction.

The report provides a basis for comparing the alternatives to one another, but it does not make a recommendation. It also represents an evaluation of conceptual designs and a screening level analysis of environmental impacts. The review contained in this report is based on existing data and information. As additional work is completed on the preferred alternative, and as additional information becomes available, the cost, performance, and environmental impacts reported here will continue to be refined. Additionally, designs that reduce construction risk and impacts, as well as other impacts, may be considered.

This report includes a summary of the evaluation of the new Segment C alternatives. It also includes an overview of the alternatives and of the agreed upon criteria and the methods used to assess each alternative. Finally, it includes a narrative describing the relative trade-offs of the new alternatives and a series of visual simulations and graphics illustrating how each alternative would look in downtown Bellevue.

Description of Alternatives

The Downtown Bellevue light rail alignments (Segment C) travel between SE 6th Street and NE 12th Street and extend east of I-405 to include the Hospital Station. This segment of the East Link Project transitions from the primarily single-family residential and commercial area of south Bellevue to the dense central business district of downtown Bellevue, which is a major regional urban center. Key destinations in the area are Bellevue’s downtown core and transit center and, on the east side of I-405, Overlake Hospital, Group Health, and Children’s Hospital medical centers. Within downtown Bellevue, city forecasts anticipate adding 13,000 housing units and 44,000 jobs between 2000 and 2030.

This Concept Design Report includes four new alternatives and two alternatives from the Draft EIS.

New Alternatives

C9T: 110th NE Tunnel

C9A: 110th NE At-Grade

C11A: 108th NE At-Grade

C14E: 114th NE Elevated

Alternatives from Draft EIS

C4A: At-Grade Couplet

C3T: 108th Avenue NE Tunnel

In addition, Sound Transit is re-evaluating the connector from Segment C to the Preferred Alternative B3S route in Segment B: South Bellevue between SE 8th Street and Main Street. One connector alternative would travel in the center of 112th Avenue SE (similar to Alternative B2A in the Draft EIS); this alternative was recommended as a cost-saving measure during the value analysis review of the project. B3S, the112th Bypass, would travel through privately owned parcels west of 114th Avenue SE. This analysis assumes the preferred alternative (B3S). Differences between the alternatives are noted in this report. This report does not include an evaluation of Segment B beyond these connection options.

1 Move B3 to at-grade on the east side of Bellevue Way SE and 112th Avenue SE, subject to further evaluation.

2 Future consideration of C3T tunnel as the preferred alternative, if additional funding sources are identified.

3 Locate D2A on the north side of NE 24th Street, subject to further evaluation.

4 New location for the Downtown Redmond Station, subject to further evaluation.

Figure 1. **East Link Project**

C9T: 110th NE Tunnel (New Alternative)

With the 110th NE Tunnel Alternative (C9T), light rail would travel between Main Street and NE 6th Street in a cut-and-cover tunnel on 110th Avenue NE. After crossing over 112th Avenue NE south of Main Street, the tunnel would begin at 110th Avenue NE and end on NE 6th Street east of 110th Avenue NE. After leaving the tunnel, light rail would cross over 112th Avenue NE and I-405. C9T is fully grade-separated.

The underground Bellevue Transit Center Station would be located under 110th Avenue NE at NE 4th Street south of the existing Bellevue Transit Center. The elevated Hospital Station would be located at NE 8th Street in the former BNSF Railway corridor and includes a grade-separated pedestrian crossing of NE 8th Street. The East Main Station would be located on the southeast corner of Main Street and 112th Avenue SE.

C9A: 110th NE At-Grade (New Alternative)

With the 110th NE At-Grade Alternative (C9A), light rail would cross over 112th Avenue NE, then travel between Main Street and NE 6th Street at-grade in the center of 110th Avenue NE. East of 110th Avenue NE on NE 6th Street, light rail would cross over 112th Avenue NE and I-405. C9A is 24 percent street running and 76 percent grade-separated.

The Bellevue Transit Center Station would be elevated on NE 6th Street east of 110th Avenue NE near the existing Bellevue Transit Center. The east end of this station would be elevated, though access from the existing Bellevue Transit Center would be at-grade. The Hospital Station would be located at NE 8th Street in the former BNSF Railway corridor and includes a grade-separated pedestrian crossing of NE 8th Street. The East Main Station would be located on the southeast corner of Main Street and 112th Avenue SE.

C11A: 108th NE At-Grade (New Alternative)

With the 108th NE At-Grade Alternative (C11A), light rail would cross over 112th Avenue NE, then travel in the center of 108th Avenue NE. On NE 6th Street east of 110th Avenue NE, light rail would climb to a structure and cross over 112th Avenue NE and I-405. C11A is 27 percent street running and 73 percent grade-separated.

The Bellevue Transit Center Station would be located at-grade at the existing Bellevue Transit Center on NE 6th Street between 108th Avenue NE and 110th Avenue NE. The elevated Hospital Station would be located at NE 8th Street in the former BNSF Railway corridor and includes a grade-separated pedestrian crossing of NE 8th Street. The 108th Station would be located on the south side of Main Street between 108th Avenue and 110th Avenue NE. Alternately, the East Main Station described for C9T and C9A could be constructed with this alternative.

C14E: 114th NE Elevated (New Alternative)

With the 114th NE Elevated Alternative (C14E), light rail would follow 114th Avenue NE from Main Street to the south side of the I-405/NE 8th Street interchange. This alternative would be elevated for its entire distance and cross over I-405 beginning at NE 6th Street. C14E is fully grade-separated.

The Bellevue Transit Center Station would be located on an elevated structure above 114th Avenue NE, between NE 4th Street and NE 6th Street, east of the existing Bellevue Transit Center. To provide better access from the Bellevue Transit Center, a moving sidewalk would connect the station to City Hall Plaza. The elevated Hospital Station would be located in the former BNSF Railway corridor north of NE 8th Street, further north than in the other alternatives. Pedestrian access across NE 8th Street would be at-grade. The East Main Station is not included in this alternative.

C4A: At-Grade Couplet
(Sound Transit Preferred Alternative, May 2009)

With the At-Grade Couplet Alternative (C4A), light rail would travel between Main Street and NE 12th Street as an at-grade couplet running counter-flow to traffic on one-way roadways (northbound track on the east side of 110th Avenue NE and the southbound track on the west side of 108th Avenue NE). Vehicle traffic on these avenues would be converted to one-way in the opposite direction of light rail travel. Both tracks would combine on NE 12th Street to cross over 112th Avenue NE and I-405. South of downtown, C4A would connect from Segment B as an elevated structure and transition to at-grade on Main Street. The Bellevue Transit Center Station would be on 108th and 110th avenues NE south of NE 6th Street near the existing Bellevue Transit Center, and the Ashwood/ Hospital Station would be located east of I-405 on the north side of NE 12th Street.

C3T: 108th NE Tunnel (Tunnel for Future Consideration as Preferred, May 2009)

The 108th NE Tunnel Alternative (C3T) would travel under 108th Avenue NE in a tunnel until turning east at NE 12th Street and transitioning to an elevated guideway to cross over 112th Avenue NE and I-405. The Bellevue Transit Center Station would be located underground on 108th Avenue NE at NE 6th Street, immediately west of the existing Bellevue Transit Center. The Ashwood/Hospital Station would be located east of I-405 on the north side of NE 12th Street.

Evaluation of the Alternatives

To identify and compare differences among the new alternatives, Sound Transit and the City of Bellevue agreed to use criteria grouped into eight categories based generally on criteria used in the Draft EIS and on City policy.The criteria categories, criteria, and measures are shown in Table 1.

Criteria category	Criteria	Measure
Cost	Capital cost	Capital cost ($2007)
Land Use accessibility/ Walk distance	Land use within walking distance of stations	Percent of 2030 forecast downtown jobs and residents within 5-minute walk of an East Link station
		Percent of 2030 forecast downtown jobs and residents within 10-minute walk of an East Link station
Ridership	Estimated 2030 ridership and light rail travel time	System ridership
		Segment C ridership
		Segement C light rail travel time
Traffic operations	Downtown traffic congestion for vehicles	Average intersection delay
		Vehicle demand served into and out of downtown
		East-west and north-south vehicular travel time
Environmental impacts	Displacements	Number of displaced residences and businesses
	Noise and vibration	Qualitative assessment of potentially affected sensitive uses and extent of possible mitigation
	Parks	Acres of parks affected
	Ecosystems	Assessment of sensitive natural resources affected
Construction effects	Construction effects	Qualitative assessment of street-level effects during construction
		Qualitative assessment of duration of construction
Construction risk	Construction risk	Qualitative assessment of construction risks to schedule and budget
Consistency with City plans and policies	Consistency with policies related to downtown alignments	Qualitative assessment of consistency with City of Bellevue Comprehensive Plan, and adopted Council interest statements

Table 1. **Criteria Categories, Criteria, and Measures**

Summary of Evaluation of Segment C: Downtown Bellevue Alternatives

Table 2 summarizes the evaluation of each new Segment C alternative using the methods described in this report.

		New Segment C: Downtown Bellevue Alternatives			
Criteria	**Measure**	**C9T** 110th NE Tunnel	**C9A** 110th NE At-Grade	**C11A** 108th NE At-Grade	**C14E** 114th NE Elevated
Cost	Estimated cost in millions ($2007)	$990	$640	$680	$560[1]
	Difference between ST2 Plan budget ($705 M) and alternative cost	($285)	$65	$25	$145
2030 Ridership	Segment boardings	8,000	7,500	8,000	6,000[2]
	East Link ridership	51,000	48,500	49,000	48,500
Alternative characteristics	Light rail travel time (minutes)	6	9	9	4
	Segment C length (miles)	1.6	1.7	1.9	1.3
	Number of stations	3	3	3	2
2030 Downtown jobs within walking distance of a station (79,000 jobs)	Percent within 5-minute walk	44%	51%	76%	27%
	Percent within 10-minute walk	97%	96%	99%	79%
2030 Downtown residents within walking distance of a station (19,000 residents)	Percent within 5-minute walk	21%	28%	53%	7%
	Percent within 10-minute walk	66%	63%	92%	46%
Traffic operations	Southbound vehicle travel time (minutes)	6.5	8.0	7.4	6.5
	Northbound vehicle travel time (minutes)	5.8	6.5	5.6	5.8
	Eastbound vehicle travel time (minutes)	5.0	4.9	5.3	5.0
	Westbound vehicle travel time (minutes)	4.9	5.2	5.8	4.9
	Percent of vehicle demand into and out of downtown served	78%	78%	77%	78%
	Average downtown vehicle delay (seconds)	67	73	70	67
	Average vehicle delay at key affected intersections (seconds)	78	85	87	78
Environmental impacts	Displacements (residential/business)	1/17	1/18	1/34	0/22
	Extent of noise mitigation needed	Slightly Lower	Higher	Slightly Higher	Higher
	Extent of vibration mitigation needed	Average	Average	Higher	Slightly Lower
	Park impacts in acres	.16	.14	0	0
	Linear feet of impacts to Sturtevant Creek	650	650	650	650
Construction risk	Relative risk to schedule and budget	Higher	Moderate	Moderate	Lower
Construction effects	Relative street level effects	Higher	Moderate	Moderate	Lower
	Construction duration	Longest	Intermediate	Intermediate	Shortest

Table 2. **Summary of Segment C: Downtown Bellevue Alternatives Evaluation**

Notes:

[1] The cost estimate for C14E does not include the addition of a circulator bus and park-and-ride lot. The addition of these amenities would add $70 million to project cost.

[2] The addition of the circulator bus or circulator bus and park-and-ride lot at Metro site does not appreciably change segment ridership.

Total East Link Project is expected to cost approximately $2.7 billion.

City of Bellevue Policy Consistency Review

The purpose of the East Link project is to fulfill adopted regional policies such as the Puget Sound Regional Council's VISION 2040 and Destination 2030 plans by providing high capacity transit connections among the region's major population and employment centers. Seattle and Bellevue are designated "metropolitan cities" within King County in VISION 2040; therefore East Link is a critical component to realizing the land use and transportation visions for the region and the City of Bellevue, particularly downtown. The East Link Project is generally consistent with Bellevue's land use and transportation vision as described in the City's Comprehensive Plan. At a more detailed policy level, each of the new Segment C alternatives is more consistent or less consistent with individual policies, but these do not constitute a "fatal flaw" for any of the alternatives.

This review is intended to provide context for the policy related evaluation criteria discussed in this report. The focus was on policies that directly relate to discussions about the downtown alignment alternatives. Policies were compiled from the City's Comprehensive Plan (including adopted light rail best practices policies) and the Council's "Future High Capacity Transit Interest Statement" (adopted 6-20-2005). Policy TR-75.8 served as the general policy screen as it was the light rail best practices policy that was specifically intended to address the downtown alignment and it directly relates to the evaluation criteria in the report: serving downtown; pedestrian environment, urban design and safety; residential and commercial impacts; and transportation system functionality.

A summary of policy consistency is provided in Table 3.

Policy-Related Evaluation Criteria	**Downtown Alignment Policy Screen** – *TR-75.8: Advocate for an alignment for downtown Bellevue that advances the adopted land use vision for an urban downtown by (see items 1 – 5 below):*		C9T (110th Tunnel)	C9A (110th At-Grade)	C11A (108th At-Grade)	C14E (114th Elevated)
2030 station boardings and East Link ridership	**Serving Downtown**	1) Optimizing ridership, system performance, and user convenience; 2) Locating stations in proximity (i.e. within a 10-min walk) to existing and planned employment and residential concentrations in the downtown subarea. **Related policies:** • Locate major office and high intensity growth in the Downtown core (S-DT-4, S-DT-8) • Accommodate Bellevue's share of regional growth (LU-3) • Advocate for transportation options that are consistent with local plans (TR-75.7) • Connect downtown Bellevue with other major regional centers (TR-75.6, ETP-31, Council Interest Statement 6-20-2005)	• 8,000 boardings and 51,000 riders	• 7,500 boardings and 48,500 riders	• 8,000 boardings and 49,000 riders	• 6,000 boardings and 48,500 riders
2030 Downtown Residential and Jobs within 5- & 10-min. walking distance of a station			• 44% of jobs and 21% of residents within 5-min. walk • 97% of jobs and 66% of residents within 10-min. walk	• 51% of jobs and 28% of residents within 5-min. walk • 96% of jobs and 63% of residents within 10-min. walk	• 76% of jobs and 53% of residents within 5-min. walk • 99% of jobs and 92% of residents within 10-min. walk	• 27% of jobs and 7% of residents within 5-min. walk • 79% of jobs and 46% of residents within 10-min. walk
Segment C stations			• 3 stations in Segment	• 3 stations in Segment	• 3 stations in Segment	• 2 stations in Segment
Please refer to the visuals for each alternative in the body of the report	**Pedestrian Environment Urban Design & Safety**	3) Address aesthetic concerns and promote superior urban design integration, within established urban context. **Related policies:** • Develop an aesthetically attractive Downtown (S-DT-3) • Ensure access to sunlight in public places (UD-32) • Promote context sensitive design to mitigate impacts and incorporate light rail into streetscape (TR-75.14) • Retain and enhance views of Downtown (S-WI-40) • Visibility of station platform from streets (Tr-75.23)	• Underground station is weather protected • Platform is not visible from street • Elevated structure at both ends of Segment	• At-grade station with canopies provides some weather protection • West end of platform is visible from street, integrated into streetscape • East end of platform is not visible from street • Elevated structure at both ends of Segment	• At-grade station with canopies provides some weather protection • Platform is visible from street and integrated with • Elevated structure at both ends of Segment bus operations at BTC, integrated into streetscape	• Covered station is weather protected • Moving sidewalk is pedestrian connection to plaza • Platform is not visible from street • Elevated structure throughout Segment

Table 3. **City of Bellevue Policy Consistency Summary**

Policy-Related Evaluation Criteria	**Downtown Alignment Policy Screen** – *TR-75.8: Advocate for an alignment for downtown Bellevue that advances the adopted land use vision for an urban downtown by (see items 1 – 5 below):*		C9T (110th Tunnel)	C9A (110th At-Grade)	C11A (108th At-Grade)	C14E (114th Elevated)
Construction effects **Environmental Impacts:** **Displacements; Noise mitigation needed; Vibration mitigation needed; Park impacts; Sturtevant Creek impacts**	**Residential & Commercial Impacts**	4) minimize impacts on businesses and residents during construction. **Related policies:** • Protect residential and commercial areas by minimizing environmental, traffic and noise impacts (TR-75.17) • Minimize impacts of transportation system on environment and quality of life (Transportation Goal) • HCT should maximize amenities while being sensitive to neighborhood and quality of life (Council Interest Statement 6-20-2005) *NOTE: Noise and vibration are not described in the policy review as some noise and vibration impacts and commen-surate mitigation is assumed for each of the alternatives.	• Longer duration of street reconstruction • 1 residential, 17 commercial displacements • Tracks next to residential areas • Maintains existing access after construction	• Shorter duration of in-street construction • 1 residential, 18 commercial displacements • Tracks next to residential areas • Alters access along 110th after construction	• Shorter duration of in-street construction • 1 residential, 34 commercial displacements • Tracks next to residential areas • Alters access along Main and 108th after construction	• Shorter duration of street reconstruction • No residential, 22 commercial displacements • Avoids residential areas • Alters access along 114th after construction
Traffic operations and travel time	**Transportation System Functionality**	5) minimize overall impacts of light rail on operation of downtown street network. **Related policies:** • Provide reliable, high performance, attractive alternatives to SOV travel by providing service to city's major employment and residential areas, add capacity rather than replace existing (TR-75.5, Council Interest Statement 6-20-2005)	• Maintains existing travel lanes • Light rail system performance and reliability not vulnerable to street traffic issues/incidents	• Reduces travel lanes for 3 blocks on 110th, eliminates northbound left turns at 2nd and 4th • Light rail system performance and reliability vulnerable to street traffic issues/incidents	• Reduces travel lanes for 3 blocks on 108th, eliminates northbound left turns at 2nd and 4th • Light rail system performance and reliability vulnerable to street traffic issues/incidents	• Maintains existing travel lanes • Light rail system performance and reliability not vulnerable to street traffic issues/incidents

Table 3. **City of Bellevue Policy Consistency Summary** *(cont.)*

Summary of Methodology by Criteria Category

Capital Cost

Sound Transit calculated capital costs in 2007 dollars for the Draft EIS; these include estimates for construction, right-of-way, construction cost markups for general conditions, overhead, profit, and sales tax. Construction costs also include a design allowance and allocated contingency. Other costs include construction management, design (environmental review, preliminary engineering, final design, permitting), agency administration, construction contingency, and project reserve.

As with the estimates reported here, the cost estimates for the ST2 Plan adopted in 2008 include a 15% project reserve above the base project estimate. Subsequent declines in revenue due to the recession currently require that Sound Transit manage to the base project estimates. Sound Transit is seeking opportunities to reduce scope and budget to restore a project reserve within currently available revenues.

Once the Sound Transit Board identifies the Segment C preferred alternative, the team will complete preliminary engineering for that alternative, which will then be used to prepare a more detailed cost estimate. This information will be presented in the Final EIS and used to develop a financial plan for the project.

Table 4 presents a summary of the items included in the cost estimates by alternative. The following subsections describe the elements included in the cost estimate for each alternative.

		Alternative C9T 110th NE Tunnel	**Alternative C9A** 110th NE At-Grade	**Alternative C11A** 108th NE At-Grade	**Alternative C14E** 114th NE Elevated
Stations	Number (Segment C)	3	3	3	2
	East Main (108th for C11A)	Elevated, side platform	Elevated, side platform	At-grade, side platform	Not included
	Bellevue Transit Center (BTC)	Underground, center platform	Elevated, center platform	At-grade, side platform	Elevated, center platform
	Hospital	Elevated, center platform	Elevated, center platform	Elevated, center platform	Elevated, center platform
Substantial street reconstruction		110th Avenue NE, NE 6th Street	110th Avenue NE, 4th Street, 6th Street	108th Avenue NE, 6th Street	Portions of 114th Avenue NE, widening of NE 6th Street
Other items		Temporary decking on 110th Avenue NE to maintain access		Reconstruction of BTC bus facilities	Flyer stop on new NE 6th Street structure Moving walkway from City Hall to BTC station Pedestrian connection from Meydenbauer Center to BTC station

Table 4. **Summary of Items Included in Cost Estimates by Alternative**

C9T: 110th NE Tunnel

The cost estimate for C9T includes three stations: elevated East Main Station with side platforms, underground Bellevue Transit Center Station with a center platform, and elevated Hospital Station with a center platform. It also includes reconstruction of 110th Avenue NE for the tunnel, due to cut-and-cover construction, and NE 6th Street to accommodate transitions between elevated and tunnel profiles.

C9A: 110th NE At-Grade

The cost estimate for C9A includes three stations: elevated East Main Station with side platforms, elevated Bellevue Transit Center Station with a center platform, and an elevated Hospital Station with a center platform. It also includes reconstruction and modification of 110th Avenue NE to accommodate at-grade light rail, NE 4th Street to accommodate tracks through the 4th Street/110th Avenue NE intersection, and of NE 6th Street to accommodate transitions between at-grade and elevated profiles.

C11A: 108th NE At-Grade

The cost estimate for C11A includes three stations: at-grade 108th Station with side platforms, at-grade Bellevue Transit Center Station with side platforms, and an elevated Hospital Station with a center platform. It also includes reconstruction and modification of 108th Avenue NE to accommodate at-grade light rail and of NE 6th Street to accommodate transitions between at-grade and elevated profiles, and reconstruction of the existing Bellevue Transit Center to integrate with the light rail station.

C14E: 114th NE Elevated

The cost estimate for C14E includes two stations: elevated Bellevue Transit Center Station with a center platform and an elevated Hospital Station with a center platform. This option does not include an East Main Station. The cost estimate also includes a moving walkway with weather protection from City Hall Plaza to the Bellevue Transit Center Station and a pedestrian bridge from the Meydenbauer Center to the walkway. It also includes widening of NE 6th Street adjacent to the Bellevue Transit Center Station; this widening will be designed to include a bus flyer stop, travel lanes, and a multi-use path on the south side of the street to accommodate the City’s future plans to extend NE 6th Street across I-405.

Costs for two additional amenities to serve the Bellevue Transit Center Station are called out separately in the estimate for this alternative. The first amenity would be a circulator bus that loops through downtown to the BTC station. The second would be an underground parking structure that would be implemented as part of a larger development project with a plaza and other features on the Metro site; one floor (200 spaces) is assumed to be used as park-and-ride. Only that one floor is included as a potential cost add-on for C14E.

Ridership

Sound Transit developed 2030 ridership projections for each alternative. These projections reflect the most recent Puget Sound Regional Council (PSRC) 2030 land use projections which include the City of Bellevue's Bel-Red and Redmond's Overlake plans that were not reflected in the Draft EIS. The regional transit network is based on the system approved by voters in 2008. The ridership category also includes a comparison of Segment C light rail travel times.

Land Use Accessibility/Walk Distance

The City of Bellevue performed a walk distance analysis to better understand the differences in pedestrian capture areas associated with new Segment C station locations. This analysis was conducted by assessing the percent of 2030 downtown employment and residential population within a 5-minute and 10-minute walk distance of each station. Using an average walk speed of 3 miles per hour, the 5-minute walk represents the higher-capture, 1/4-mile distance for transit users. The 10-minute walk represents the 1/2-mile distance as identified in the Bellevue Light Rail Best Practices Report and reflected in the City's Comprehensive Plan.

The City converted the 5-minute and 10-minute walk times to more precise distances than a standard 1/4-mile and 1/2-mile measure based on two main factors: (1) the need for vertical circulation at some stations and (2) the presence of moving sidewalks in Alternative C14E (see page 53 for a desciption of this alternative). Stations requiring vertical circulation were assigned a walk time "penalty" for the rider to reach the sidewalk. C14E was assigned a "bonus" of reduced walk time due to the inclusion of a moving sidewalk.

Traffic Operations

This traffic analysis provides information that allows the stakeholders to compare the downtown alternatives with regard to their effects on the downtown Bellevue transportation system.

In undertaking the traffic operations analysis, the City of Bellevue used the Bellevue-Kirkland-Redmond (BKR) travel demand model (rather than the PSRC travel demand model, which was used for the Draft EIS) to produce vehicle travel demand forecasts. Forecasts for each alternative were based on the same set of land use and transportation network assumptions; with some variability in the local street network to reflect the configuration of the two at-grade alternatives. For purposes of the traffic analysis, the same overall network assumptions are assumed to be consistent for C9T and C14E, since these are both grade-separated alternatives; therefore, the data reported for each of these alternatives are the same. The analysis did not take into account a park-and-ride garage for C14E. It should also be noted that, to be consistent with the Draft EIS, some roadway assumptions are different than previous City planning and analysis efforts.

Using these forecasts, the City, Sound Transit and consultant staff collaboratively prepared a traffic operations analysis and simulation of the downtown transportation system. For the City, all previous Downtown traffic analysis (as part of the Downtown Plan) was completed for a 2020 time horizon. To be consistent with the EIS the time horizon for this analysis is 2030. Lastly, the analysis focuses on the PM peak hour conditions. This generally is the most congested time of the day in downtown Bellevue. The greatest changes in vehicle congestion between now and 2030 are due to growth in downtown Bellevue.

Data was produced for both the downtown transportation system as a whole and for specific intersections. For this report, the following system-wide or composite measures are reported for the 2030 PM peak hour:

- Vehicle Travel Times: Travel times are calculated between two points along key north-south and east-west roads. The four measures below describe the values presented in this report:
    - Southbound and Northbound Vehicle Travel Times: These measures report the average travel times for a composite of key north-south Downtown arterials between Bellevue Way and 112th Avenue NE (from Main Street to NE 12th Street
    - Eastbound and Westbound Vehicle Travel Times: These measures report the average travel times for a composite of key east-west Downtown arterials between Main Street and NE 12th Street (from Bellevue Way to 112th Avenue NE).
- Percent of Vehicle Demand Served Into and Out of Downtown Bellevue: This measures the percentage of vehicles able to

enter or exit Downtown as compared to total expected number of trips based on the 2030 land use forecast. It was measured at key arterials encompassing the core of Downtown Bellevue (Main Street, 112th Avenue NE, NE 12th Street, Bellevue Way).

- Average Vehicle Delay at Intersections: Intersection delay measures the amount of time a vehicle is expected to wait at an intersection. This measure is provided for two areas; the larger downtown transportation system bounded by Bellevue Way, 112th Avenue NE, Main Street and NE 12th Street (Downtown); and a more focused study area surrounding the light rail alternatives in southeast downtown, which is an area bounded by 106th Avenue NE, Main Street, 112th Avenue NE, and NE 8th Street. Individual vehicle intersection delays are weighted by the number of vehicles served at each intersection to provide a composite average delay experienced in each of the two values reported.

Environmental Impacts

Sound Transit used a subset of the environmental impacts analyzed in the Draft EIS to provide a comparison of key environmental factors likely to differentiate among the alternatives or otherwise be critical to community decision-making.

Displacements

Sound Transit counted displacements based on properties identified by project civil engineers as requiring demolition of buildings. The number of businesses affected was determined based on property site visits during 2007 for the Draft EIS.

Noise and Vibration

Sound Transit identified potential noise impacts by determining the total number of sensitive noise receptors potentially affected by light rail noise, according to a screening level noise model. The relative extent of sensitive receptors with the new alternatives was qualitatively compared to the average number of potentially affected sensitive receptors. Sensitive noise receptors generally include places where people typically sleep—homes and hotels in the study area.

Sound Transit identified potential vibration impacts by making a qualitative assessment of the number of sensitive receptors located near the light rail tracks for each alternative as compared to the average number of potentially affected receptors reported for all alternatives. Sensitive receptors include the Meydenbauer Center and nearby hospitals, residences, and hotels. The analysis used a screening-level approach based on distance from the track; it is assumed that surface and tunnel profiles cause vibration impacts at a greater distance than elevated profiles.

Ecosystems

Sound Transit calculated ecosystem impacts by overlaying conceptual designs of the alternatives over maps representing ecosystem resources and data collected during preparation of the Draft EIS. Sturtevant Creek could be affected between Main Street and SE 6th Street and under the Hospital Station at NE 8th Street. These impacts are reported in the analysis of the connectors between the Segment C alternatives and Segment B.

Parks

Sound Transit calculated park impacts by overlaying conceptual designs of the alternatives over park maps from the City of Bellevue.

Construction Effects and Risks

Construction Risks

Sound Transit developed a qualitative assessment of the construction risks for each alternative by assessing the schedule and budget risks for different types of construction (at-grade, retained cut and fill, elevated, cut-and-cover tunnel) for each construction stage and then by assessing the proportion of each route that would be constructed with each method. Construction risks are generally defined as items that could result in extra expense or a schedule delay. Generally, at-grade and elevated construction carries the lowest risk and retained cut and fill and cut-and-cover tunnel construction carries a higher risk.

Construction Duration

Sound Transit developed a construction schedule for each alternative based on construction type and typical production rates for each construction type. The reported qualitative comparison reflects a typical project. The actual construction schedule will be dependent on the contracting mechanism, the contractor’s methods, timing of the start of construction, and other factors that will not be known until final design.

Street-Level Construction Effects

Sound Transit developed a qualitative assessment of the disruption to businesses and street-level activity associated with each alternative. This measure is intended to highlight the differences between the most intense construction phases —the time that those who live, work, or do business in downtown Bellevue are most likely to be affected by construction activities— for each alternative. Generally, at-grade and elevated construction require major disruption for a shorter period in any specific area, and cut-and-cover tunnel or retained cut-and-fill construction requires major disruption for a longer period of time in any specific area. Three of the alternatives would have some impacts to the parking garage and public space at City Hall Plaza. Effects at City Hall Plaza are reported in the alternative evaluation section of this report.

This report reflects planning-level assumptions about construction methods, risks, and effects. Other construction methods will be evaluated by Sound Transit during the design process.

C9T: 110th NE Tunnel

Technical Analysis

Alternative C9T would cost about $990 million ($2007), the highest cost of any of the new alternatives. An estimated 8,000 riders would board the system within Segment C, and 44 percent of downtown Bellevue's forecast jobs would be within a 5-minute walk of an East Link station; 97 percent would be within a 10-minute walk, fewer than with C9A or C11A, but more than C14E. Light rail travel time is 6 minutes for the segment and includes the time for trains to stop at three stations.

This alternative would cause the most construction disruption because of the extended time required for underground guideway construction and restoration of the street. This alternative would have the greatest effect on City Hall Plaza. The parking garage would be modified and one plaza will be rebuilt

Alternative C9T would require potential mitigation for slightly fewer sensitive noise receptors than the average, and a similar number of vibration receptors; impacts to any of these receptors could likely be mitigated. This alternative would displace one home near the corner of Main Street and 112th Avenue SE and 17 businesses primarily on the south side of Main Street, and on 116th Avenue NE by the Hospital Station. It would have a small impact on the 110th Avenue Pocket Parks.

Alternative C9T is fully grade-separated, and along with C14E has the shortest southbound vehicle travel times, and similar or better northbound travel times compared to the at-grade alternatives. East-west travel time was generally similar among all alternatives as all alternatives had the same east-west signal operations. Alternative C9T, along with Alternative C14E, has less vehicle delay at intersections than the at-grade alternatives for the downtown as a whole. Within the smaller subarea, C9T, along with C14E, had approximately 10 percent less delay at intersections than the at-grade alternatives. Percent of vehicle demand served was comparable among all alternatives, reflecting expected overall congested conditions in downtown.

Evaluation Summary: C9T – 110th NE Tunnel

Criteria	Measure	C9T 110th NE Tunnel
Cost	Estimated cost in millions ($2007)	$990
	Difference between ST2 Plan budget ($705 M) and alternative cost	($285)
2030 Ridership	Segment boardings	8,000
	East Link ridership	51,000
Alternative characteristics	Light rail travel time (minutes)	6
	Segment C length (miles)	1.6
	Number of stations	3
2030 Downtown jobs within walking distance of a station (79,000 jobs)	Percent within 5-minute walk	44%
	Percent within 10-minute walk	97%
2030 Downtown residents within walking distance of a station (19,000 residents)	Percent within 5-minute walk	21%
	Percent within 10-minute walk	66%
Traffic operations	Southbound vehicle travel time (minutes)	6.5
	Northbound vehicle travel time (minutes)	5.8
	Eastbound vehicle travel time (minutes)	5.0
	Westbound vehicle travel time (minutes)	4.9
	Percent of vehicle demand into and out of downtown served	78%
	Average downtown vehicle delay (seconds)	67
	Average vehicle delay at key affected intersections (seconds)	78
Environmental impacts	Displacements (residential/business)	1/17
	Extent of noise mitigation needed	Slightly Lower
	Extent of vibration mitigation needed	Average
	Park impacts in acres	.16
	Linear feet of impacts to Sturtevant Creek	650
Construction risk	Relative risk to schedule and budget	Higher
Construction effects	Relative street level effects	Higher
	Construction duration	Longest

C9A: 110th Avenue NE At-Grade Alternative – Downtown Land Use Accessibility

C9A: 110th NE At-Grade

Technical Analysis

Alternative C9A would cost about $640 million ($2007), less than C9T or C11A, but more than C14E. An estimated 7,500 riders would board the system within Segment C with Alternative C9A, fewer than with C9T or C11A. 51 percent of downtown Bellevue's forecast jobs would be within a 5-minute walk of a station; 96 percent would be within a 10-minute walk, more than with C9T or C14E, but fewer than C11A. Light rail travel time is 9 minutes for the segment and includes the time for trains to stop at three stations.

Alternative C9A would require potential mitigation for more sensitive noise receptors than average, and a similar number of vibration receptors; impacts to any of these receptors could likely be mitigated. This alternative would displace one residence near 112th Avenue SE and Main Street and 18 businesses primarily on the south side of Main Street and on 116th Avenue NE near the BNSF Railway right-of-way at the Hospital Station. It would have a small impact on 110th Avenue Pocket Parks.

This alternative would have some impacts on City Hall Plaza. The parking garage would be modified, but it would be open for use during construction. The plaza would be rebuilt along with the project.

The transition structure along Main Street between 112th Avenue NE and 110th Avenue NE would be lower than with C11A because this alternative does not include the 108th Station. This is illustrated in the visual simulation “South Transition Structure at Main Street Looking West.”

Alternative C9A crosses 4 signalized intersections in an at-grade alignment along 110th Avenue NE between Main and NE 6th Street. C9A has greater northbound and southbound travel times than the other alternatives. East-west travel time was generally similar among all alternatives as all alternatives had the same east-west signal operations. Alternative C9A has higher vehicle delay at intersections than the other alternatives for the downtown as a whole. Within the smaller subarea, C9A has approximately 10% more delay at intersections than the grade-separated alternatives. Percent of vehicle demand served was comparable among all alternatives, reflecting expected overall congested conditions in downtown.

Evaluation Summary: C9A – 110th NE At-Grade

C9A: 110th NE At-Grade Alternative – Downtown Land Use Accessibility

C11A: 108th NE At-Grade

C11A: 108th NE At-Grade

Technical Analysis

Alternative C11A would cost about $680 million ($2007), more than C9A or C14E, but less than C9T. An estimated 8,000 riders would board the system within Segment C with Alternative C11A, and 76 percent of downtown Bellevue's forecast jobs would be within a 5-minute walk of an East Link station; 99 percent would be within a 10-minute walk. C11A has the highest percentage of downtown jobs and residents with walking distance of a station of any of the new alternatives. Segment ridership for C11A is equal to C9T and higher than for either C9A or C14E. Unlike the other alternatives, C11A has a station on Main Street east of 108th Avenue. Light rail travel time is 9 minutes for the segment and includes the time for trains to stop at three stations.

Alternative C11A would potentially require potential mitigation for more sensitive noise and more vibration receptors than average; impacts to any of these receptors could likely be mitigated. This alternative would displace one residence near 112th Avenue SE and Main Street, and 34 businesses primarily on the south side of Main Street, and on 116th Avenue NE near the BNSF Railway right-of-way at the Hospital Station. This option would displace more businesses on Main Street than the other options. It would not affect any park land.

This alternative would have some impacts on City Hall Plaza and the garage related to roadway widening to the south. The parking garage would be modified, but it would be open for use during construction. The plaza would be rebuilt along with the project. This alternative would also require reconstruction of the Bellevue Transit Center.

The transition structure along Main Street between 112th Avenue NE and 108th Avenue NE would be higher than with C9A to ensure that the 108th Station at the top of the hill is at-grade and level. This is illustrated in the visual simulation "South Transition Structure at Main Street Looking West."

Alternative C11A crosses 5 signalized intersections in an at-grade alignment along 108th Avenue NE between Main and NE 6th Street. C11A has greater southbound travel times and similar northbound travel times than the grade separated alternatives. East-west travel time was generally similar among all alternatives as all alternatives had the same east-west signal operations. Alternative C11A has higher vehicle delay at intersections than the grade separated alternatives for the downtown as a whole. Within the smaller subarea, C11A has approximately 10% more delay at intersections than the grade-separated alternatives. Percent of vehicle demand served was comparable among all alternatives, reflecting expected overall congested conditions in downtown.

Evaluation Summary: C11A – 108th NE At-Grade

Criteria	Measure	C11A 108th NE At-Grade
Cost	Estimated cost in millions ($2007)	$680
	Difference between ST2 Plan budget ($705 M) and alternative cost	$25
2030 Ridership	Segment boardings	8,000

C11A: 108th NE At-Grade Alternative – Downtown Land Use Accessibility

C14E: 114th NE Elevated

Technical Analysis

Alternative C14E would cost about $560 million ($2007), the lowest of any new alternative. An estimated 6,000 riders would board the system within Segment C with Alternative C14E, the fewest of any new alternative. 27 percent of downtown Bellevue's forecast jobs would be within a 5-minute walk of a Segment C station; 79 percent would be within a 10-minute walk, the fewest of any new alternative. The inclusion of a circulator bus and a 200-space park-and-ride lot would add $70 million to the cost, but would not increase segment ridership substantially. The light rail travel time is 4 minutes for the segment and includes the time for trains to stop at two stations.

Construction for this alternative would cause less disruption than the tunnel and at-grade options because of the limited extent of construction in Downtown Bellevue.

Alternative C14E would potentially affect more sensitive noise receptors and fewer sensitive vibration receptors than average for all alternatives. This alternative would displace 22 businesses—primarily on 116th Avenue NE near the BNSF Railway right-of-way at the Hospital Station. It would not affect any park land.

Alternative C14E is fully grade-separated, and along with C9T has the shortest southbound vehicle travel times, and similar or better northbound travel times compared to the at-grade alternatives. East-west travel time was generally similar among all alternatives as all alternatives had the same east-west signal operations. Alternative C14E, along with Alternative C9T, has less vehicle delay at intersections than the at-grade alternatives for the downtown as a whole. Within the smaller subarea, C14E, along with C9T, had approximately 10 percent less delay at intersections than the at-grade alternatives. Percent of vehicle demand served was comparable among all alternatives, reflecting expected overall congested conditions in downtown.

If C14E is modified to connect to B7, ridership would be lower because that alignment would not serve the South Bellevue Park-and-Ride.

Evaluation Summary: C14E – 114th NE Elevated

Criteria	Measure	C14E 114th NE Elevated
Cost	Estimated cost in millions ($2007)	$560[1]
	Difference between ST2 Plan budget ($705 M) and alternative cost	$145
2030 Ridership	Segment boardings	6,000[2]
	East Link ridership	48,500
Alternative characteristics	Light rail travel time (minutes)	4
	Segment C length (miles)	1.3
	Number of stations	2
2030 Downtown jobs within walking distance of a station (79,000 jobs)	Percent within 5-minute walk	27%
	Percent within 10-minute walk	79%
2030 Downtown residents within walking distance of a station (19,000 residents)	Percent within 5-minute walk	7%
	Percent within 10-minute walk	46%
Traffic operations	Southbound vehicle travel time (minutes)	6.5
	Northbound vehicle travel time (minutes)	5.8
	Eastbound vehicle travel time (minutes)	5.0
	Westbound vehicle travel time (minutes)	4.9
	Percent of vehicle demand into and out of downtown served	78%
	Average downtown vehicle delay (seconds)	67
	Average vehicle delay at key affected intersections (seconds)	78
Environmental impacts	Displacements (residential/business)	0/22
	Extent of noise mitigation needed	Higher
	Extent of vibration mitigation needed	Slightly Lower
	Park impacts in acres	0
	Linear feet of impacts to Sturtevant Creek	650
Construction risk	Relative risk to schedule and budget	Lower
Construction effects	Relative street level effects	Lower
	Construction duration	Shortest

Notes:

[1] The cost estimate for C14E does not include the addition of a circulator bus and park-and-ride lot. The addition of these amenities would add $70 million to project cost.

[2] The addition of the circulator bus or circulator bus and park-and-ride lot at Metro site does not appreciably change segment ridership.

C14E: 114th NE Elevated Alternative – Downtown Land Use Accessibility

Alternatives to Connect to Segment B

Alternatives to Connect to Segment B

In May 2009, Sound Transit identified a preferred preferred alternative for the South Bellevue portion of East Link – the 112th NE Bypass (B3S). This alternative approaches downtown Bellevue on a new right-of-way east of 112th Avenue and behind commercial buildings and is the approach that is assumed in the evaluation of the new downtown Bellevue alternatives.

Recently, Sound Transit received a report from a value analysis panel that was convened to study design changes that might reduce overall project costs. One of the panel's recommendations for reducing costs is to use a median-running alignment on 112th NE for the approach into downtown. The City of Bellevue has requested that the evaluation of the value analysis recommendation include a consideration of two other alignments on 112th Avenue:

- A side running at-grade alignment on 112th Avenue
- A side running alignment in a retained cut on 112th Avenue

In order to provide information on the range of potential costs and impacts, this section presents a comparison of the 112th Bypass (B3S) option with the 112th NE At-Grade (B2A) option from the Draft EIS. The analysis was prepared for each of the downtown alternatives. When matched with the B2A alternative, three of the downtown alternatives (the tunnel and two at-grade alternatives) are $50 to $100 million less expensive. The C14E alignment is assumed to connect only to the 112th NE Bypass (B3S) or the BNSF alternative (B7) which does not have substantially different costs than the B3S approach to downtown. A summary of these costs and the differences in environmental impacts is shown in Table 5.

		Via B3S – 112th NE Bypass				**Via B2A – 112th NE At-Grade**		
		C9T	C9A	C11A	C14E	C9T	C9A	C11A
Estimated cost in millions ($2007)		$990	$640	$680	$560	$890	$540	$630
Difference between ST2 Plan budget ($705 M) and alternative cost		($285)	$65	$25	$145	($185)	$165	$75
Environmental impacts	Displacements (residential/business)	1/17	1/18	1/34	0/22	1/16	1/17	1/33
	Extent of noise mitigation needed	Slightly Lower	Higher	Slightly Higher	Higher	Slightly Higher	Higher	Higher
	Extent of vibration mitigation needed	Average	Average	Higher	Slightly Lower	Average	Average	Slightly Lower
	Park impacts (acres)	.16	.14	0	0	.16	.14	0
	Linear feet of impacts to Sturtevant Creek	650	650	650	650	550	550	550

Next Steps

This report will serve as the basis for a policy discussion about the future of a light rail route in downtown Bellevue. The report will be reviewed by the Sound Transit Board of Directors, the Bellevue City Council, business and neighborhood groups in Bellevue, and the general public at an open house. After collecting input through each of these activities, the Sound Transit Board of Directors will identify a preferred alternative.

Once a preferred alternative for downtown Bellevue is identified, Sound Transit will complete preliminary engineering for the downtown Bellevue segment (similar to the work currently being done in the other segments). Sound Transit will also publish the project’s Final EIS at the end of 2010. Sound Transit expects to begin final design in 2011 and begin construction as soon as 2013.

Introduction

Project Overview

Sound Transit is studying an extension of the light rail system from Downtown Seattle east to Bellevue and Redmond, as shown in Figure 1. The East Link Project would connect the Eastside's biggest population and employment centers and serve 45,000 to 50,000 daily riders on one of the region's most congested travel corridors. Sound Transit is preparing a Supplemental Draft Environmental Impact Statement (SDEIS) to address new or changed project alternatives. The SDEIS is anticipated to be issued in Fall 2010. A Final EIS for the East Link Project is scheduled to be issued in spring 2011.

The East Link project faces two sources of financial pressure. First, revenue forecasts for the ST2 plan, including East Link, have decreased by 20%. Second, funding for a tunnel in downtown Bellevue is not included in the ST2 Plan. Project savings need to be identified to address both these financial pressures

In the fall of 2009, Sound Transit conducted a value review and recommended the 112th Avenue alignment as a potential cost saving measure. The February 2010 Downtown Bellevue Concept Design Report reviewed this alignment option, which has also been studied in the Draft EIS, and in April 2010, the Sound Transit Board of Directors identified a 112th Avenue alignment (known as the B2Modified Alternative) as the preferred alternative for Segments B and C, replacing Alternative B3S, identified as the Preferred Alternative by the Sound Transit Board in May 2009. Running the line on 112th Avenue is anticipated to cost less and reduce potential impacts on wetlands and streams.

The B2Modified Alternative includes the following elements:

- An elevated exit from the center of I-90 and preservation of direct high-occupancy vehicle (HOV) access from southbound Bellevue Way to westbound I-90 and eastbound I-90 to northbound Bellevue Way.
- An elevated profile on the east side of Bellevue Way to the South Bellevue Station.
- An elevated South Bellevue station on the existing park-and-ride lot property with a park-and-ride garage.
- An alignment along the east side of Bellevue Way to 112th Avenue SE that continues north from Bellevue Way along 112th Avenue SE to Downtown Bellevue.

To further refine B2Modified, Sound Transit is considering six design options that generally follow 112th Avenue SE from Bellevue Way to Downtown Bellevue. This 112th Alignment Options Concept Design Report provides the public and elected officials with

information about each of the design options and facilitates the identification of an option that balances costs and potential impacts.

The 112th design options and report have been developed jointly by Sound Transit and the City of Bellevue.

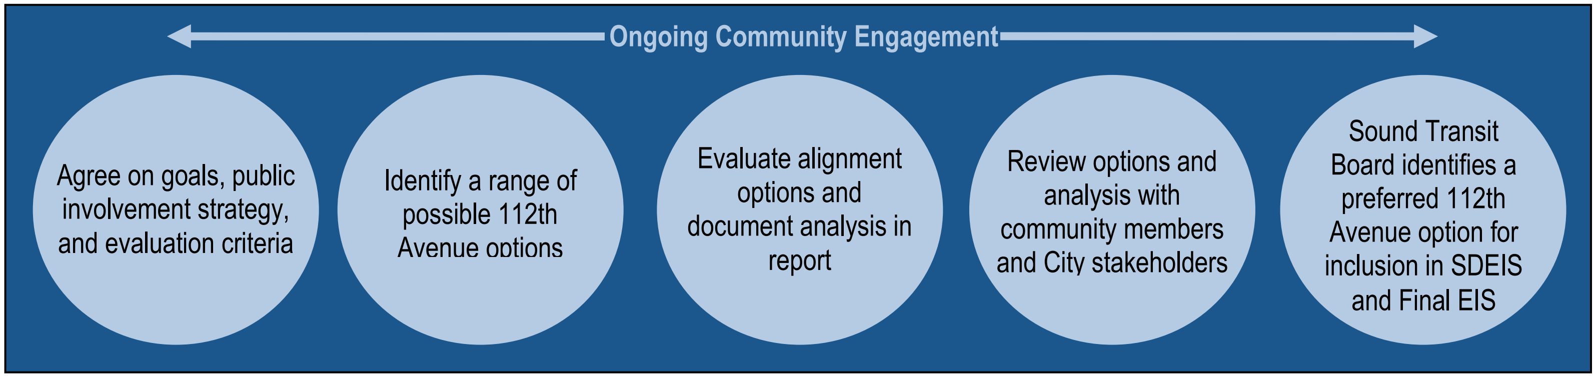
In late July, the Sound Transit Board intends to identify a preferred option along 112th Avenue after reviewing the information in this report and other input from the City of Bellevue and the community. Sound Transit will then complete preliminary engineering and environmental review for the project.

While identifying a preferred alternative is an important step in the process, it is not a final decision. All of the alternatives in the Draft EIS, including the City of Bellevue’s preferred alternative, B7, will continue to be carried forward and evaluated. The Sound Transit Board will select the final East Link route in 2011 after completion of the Final EIS. After the Final EIS, Sound Transit will complete final design, permitting, and construction.

Public Involvement and Technical Coordination

The technical information provided in this report was developed by Sound Transit, in coordination with the City of Bellevue. The option analysis process, illustrated in Figure 2, began with a technical workshop to develop alternatives and evaluation measures and has included opportunities for Sound Transit and City staff to review the analysis that is described in this report. In some cases, the City has undertaken a peer review of the Sound Transit consulting team's work to validate analysis. The work presented in this report represents analysis that has been reviewed by both the City and Sound Transit staff.

In addition to technical work, outreach staff from the City of Bellevue and Sound Transit have worked closely to develop and implement a program to support meaningful involvement of community members and stakeholders. Some outreach has already occurred and additional opportunities for involvement will follow publication of this report.



Ongoing Community Engagement

Agree on goals, public involvement strategy, and evaluation criteria

Identify a range of possible 112th Avenue options

Evaluate alignment options and document analysis in report

Review options and analysis with community members and City stakeholders

Sound Transit Board identifies a preferred 112th Avenue option for inclusion in SDEIS and Final EIS

Figure 2. **112th Alignment Options Analysis Process**

Description of 112th Avenue Options

The 112th Avenue options would provide a connection between the intersection of 112th Avenue SE and Bellevue Way in South Bellevue (Segment B) and Downtown Bellevue (Segment C).

Alignment Options

Six options that follow 112th Avenue from the “Y” at Bellevue Way have been developed. Each of these options follows 112th Avenue SE to Main Street, and some continue to NE 2nd Street. The options connect with one of the preferred Downtown Bellevue alignments, either the tunnel option (C9T-110th Tunnel) or the at-grade option (C11A-108th At-Grade).

Four options are compatible with the preferred downtown tunnel alternative (C9T-110th Tunnel). Two of these options, a center running and a westside running, would enter the tunnel at Main Street. The other two options, a center running and an eastside running, would enter the tunnel at NE 2nd Street. The final two options, a center running and a westside running option, are compatible with the preferred at-grade downtown alternative (C11A-108th At-Grade).

Cross-section and Profiles

The options include several profiles:

- At-grade – a profile that is generally at street level within or adjacent to the street. Street crossings are at traffic signals or are gated.
- Elevated – a profile that is higher than street level on a structure (bridge). Light rail generally passes over intersections and streets so gates or signals are not required.
- Retained cut – a profile that is below street grade in a trench with a retaining wall on one or both sides. Streets and driveways generally cross over the light rail alignment on short bridges or lids so gates or signals are not required.
- Tunnel – a profile that is underground and below a street, sidewalk, or other land use. All tunnel options included in this report are assumed to be cut and cover construction.

The options also have different cross-sections. The light rail alignment would operate on the eastside, westside, or in the center of 112th Avenue SE. The current travel lanes on 112th Avenue SE would be maintained with two southbound and two northbound lanes.

Descriptions of Options

Option 1: Center Running to Main Street Tunnel

With Option 1, light rail travels in a retained cut “trench” on the east side of Bellevue Way north of the Winters House. North of Bellevue Way, light rail transitions to street level and travels on the east side of 112th Avenue SE. Just south of SE 15th Street, light rail crosses the northbound lanes of 112th Avenue SE at a gated crossing and continues north in the center of 112th Avenue SE, still at-grade. An at-grade station is located in the center of 112th Avenue SE north of SE 8th Street.

South of Main Street, light rail crosses the southbound lanes of 112th Avenue SE at a gated crossing and curves to the west along Main Street in a retained cut “trench.” Just east of 110th Place and Main Street, light rail then transitions to a tunnel that follows 110th Avenue NE to an underground Bellevue Transit Center Station under 110th Avenue NE at NE 4th Street.

The following sections describe and illustrate each of the six 112th Avenue options. More detailed maps of the options are provided in Appendix A.

Option 2: Westside Running to Main Street Tunnel

With Option 2, light rail travels in a retained cut “trench” on the east side of Bellevue Way north of the Winters House. North of Bellevue Way, light rail transitions to street level and travels on the east side of 112th Avenue SE. The crossings of SE 8th and 15th streets are gated. An at-grade station is located north of SE 8th Street.

At the SE 6th Street traffic signal, light rail crosses 112th Avenue SE and travels along the west side of the street. South of Main Street, the alignment transitions to a tunnel that follows 110th Avenue NE to an underground Bellevue Transit Center Station under 110th Avenue NE at NE 4th Street.

Option 3: Center Running to 2nd Street Tunnel

With Option 3, light rail travels in a retained cut “trench” on the east side of Bellevue Way north of the Winters House. North of Bellevue Way, light rail crosses to the center of 112th Avenue SE. At this crossing, the light rail alignment is below street level; the northbound lanes of 112th Avenue SE cross over the tracks to accommodate the transition from the trench to the center of 112th Avenue SE.

Light rail travels at-grade in the center of 112th Avenue SE with an at-grade station north of SE 8th Street. Light rail crosses the southbound lanes of 112th Avenue SE at NE 2nd Street. It then transitions to a tunnel that follows 110th Avenue NE to an underground Bellevue Transit Center Station under 110th Avenue NE at NE 4th Street.

Option 4: Eastside Running to 2nd Street Tunnel

With Option 4, light rail travels in a retained cut “trench” on the east side of Bellevue Way north of the Winters House. North of Bellevue Way, light rail transitions from a retained cut “trench” to a street-level route on the east side of 112th Avenue SE. Light rail crosses SE15th and SE 8th streets at gated crossings.

A street-level station is located north of SE 8th Street. At the station, light rail begins to transition to a retained cut “trench” along the east side of 112th Avenue SE. SE 6th Street, driveways, and Main Street cross over the light rail tracks on short bridges or lids.

South of NE 2nd Street, light rail transitions to a tunnel, which begins along 112th Avenue NE, then follows NE 2nd to 110th Avenue NE, where there is an underground station below NE 4th Street.

Option 5: Center Running to At-Grade

With Option 5, light rail travels in a retained cut “trench” on the east side of Bellevue Way north of the Winters House. North of Bellevue Way, light rail transitions from a retained cut “trench” to a street-level route in the middle of 112th Avenue SE. At this crossing, the light rail alignment is below street level; the northbound lanes of 112th Avenue SE cross over the tracks to accommodate the transition from the trench to the center of 112th Avenue SE.

North of SE 4th Street, light rail transitions to an elevated structure. It crosses over the southbound lanes of 112th Avenue SE on an elevated structure and serves a station on the south side of Main Street between 110th Avenue NE and 108th Avenue NE. West of the station, light rail curves north on 108th Avenue NE at street level and serves an at-grade Bellevue Transit Center Station on NE 6th Street.

North of Bellevue Way, light rail transitions from a retained cut “trench” to street level on the east side of 112th Avenue SE. South of SE 15th Street, light rail crosses the northbound lanes of 112th Avenue SE at a gated crossing and continues north in the center of 112th Avenue SE at street level.

At the SE 6th Street signal, light rail crosses the southbound lanes of 112th Avenue SE to run along the west side of 112th Avenue SE. North of SE 4th Street, light rail climbs to an elevated structure that crosses over SE 1st Street. Light rail transitions to street level, where it serves a station on the south side of Main Street between 110th Avenue NE and 108th Avenue NE. West of the station, light rail curves north on 108th Avenue NE at street level to an at-grade Bellevue Transit Center Station on NE 6th Street.

Evaluation of Options

This section summarizes and describes the evaluation of the 112th Avenue Options and the methodology used for the evaluation. Table 1 lists the criteria and measures used to identify and compare differences among the new options. These criteria were based on criteria found in the Draft EIS. Table 2 summarizes the results of the evaluation of the 112th Avenue options for each criterion.

Table 1. **Criteria and Measures**

Criteria	Measures
Capital cost reduction	Estimated capital cost reduction as compared to the Alternative B3S-C9T approach to Downtown Bellevue ($2007)
Transportation	Number of driveways converted to right-in/right-out (left turns are prohibited) or closed with alternate access available
	Number of side streets on 112th Avenue closed or restricted to right-in/right-out (where left turns are prohibited)
	Number of at-grade roadway crossings by light rail
	Number of study area intersections that fail to meet the City of Bellevue's level of service (LOS) standard before and after mitigation
Displacements	Number of residences displaced
	Number of businesses displaced
Transit Noise	Number of affected receivers before and after mitigation (receivers are defined as residences or other sensitive uses; each unit—hotel room, apartment, house—is counted as one receiver.)
Visual	No measure – see conceptual illustrations
Wetlands	Acres of wetland affected
	Acres of wetland buffer affected
Parks	Acres of parkland affected
Relative construction impacts	Qualitative comparison of construction disruption to those land uses along or using 112th Avenue, including utility relocation, general disruption, and street reconstruction
Relative construction duration	Qualitative comparison of construction duration

Table 2. **Summary of 112th Avenue Options Evaluation**

		Tunnel: Main Street Portal		Tunnel: 2nd Street Portal		108th Avenue At-Grade	
Criteria	**Measures**	**Option 1 (Center)**	**Option 2 (Westside)**	**Option 3 (Center)**	**Option 4 (Eastside)**	**Option 5 (Center)**	**Option 6 (Westside)**
Capital Cost Reduction	Estimated reduction in capital cost compared to B3S-C9T (millions, $2007)[a]	$75-125	$85-150	$105-170	$75-135	$255-425	$280-455
Transportation	Driveways converted to right-in, out or closed (with alternate access available)	15	2	15	2	15	6
	Changes to side streets (closed/ converted to right-in, right-out)	0/2	1/0	1/2	0/0	2/2	3/0
	At-grade roadway crossings	4	3	4	2	2	3
	Intersections that do not meet City LOS standard (without mitigation/ with mitigation)	1/0	1/0	0/0	1/0	1/0	1/0
Displacements	Residences displaced	1	46	0	0	2	46
	Businesses displaced	7	7	5	5	7	7
Transit Noise	Impacts (severe/moderate)	21/107	6/42	21/98	1/31	3/116	9/87
	Impacts after mitigation (severe/moderate)[b]	0/0	0/0	0/0	0/0	0/0	0/0
Visual	No measure	See conceptual illustrations in separate Appendix C					
Wetlands	Wetlands affected (acres)	0	0	0	0	0	0
	Wetland buffer affected (acres)	1.3	2.0	0.4	2.1	0.4	1.3
Parks	Parklands affected (acres)	0.5	1.4	0.2	0.3	0.2	1.0
Construction impacts	Relative construction disruption on 112th Avenue	Moderate to higher	Lower	Moderate to higher	Moderate	Moderate to higher	Moderate to lower
	Relative construction duration	Intermediate	Shortest	Intermediate	Longest	Intermediate	Intermediate

[a] Cost are presented in a range to reflect the uncertainty at this stage of design and estimating. Applying a similar uncertainty factor to the estimate of additional financing needed for updated preferred alternative with C9T in downtown Bellevue yields a range of $255 to 415 million.

[b] All interior impacts can be mitigated. There may be some residual impacts to outdoor areas.

Summary of Methodology and Mitigation by Criteria

Sound Transit used a subset of the potential environmental impacts analyzed in the Draft EIS as a basis for the comparison of key environmental factors to differentiate among the options. Where applicable, a summary of potential mitigation is also provided.

The same study area was used for each criterion. Shown in Figure 3, the study area has been defined to highlight the differences among the 112th Avenue SE options. The study area is generally bounded by the “Y” at 112th Avenue SE and Bellevue Way to the south and at the point where each option meets 110th Avenue NE: either Main Street or NE 2nd Street.

The methodologies and mitigation proposals presented herein are preliminary and are only useful for comparisons among the options presented. The Supplemental Draft EIS and Final EIS will present more complete impact analyses and mitigation strategies for the preferred option.

The methodology and proposed mitigation for each criterion are summarized below.

Figure 3. **Study Area Map**

Capital Cost Reduction

Sound Transit calculated capital costs in 2007 dollars. Estimated capital costs include construction, right-of-way, construction cost markups for general conditions, overhead, profit and sales tax, a design allowance, and allocated contingency. Other costs reflected in the total capital cost include construction management, design (including environmental review, preliminary engineering, final design, and permitting), agency administration, construction contingency, and project reserve. For the purposes of this report, costs are reported as the reduction between the B3S approach to Downtown Bellevue and each 112th Avenue alignment option. A range of potential cost reductions are provided for each option. This approach of reporting a range reflects the limited conceptual level of design available and is consistent with the methodology used to prepare the estimates.

The potential cost reductions reflected in this report are preliminary estimates and are only useful in comparing among the options. After a preferred option is identified for this segment, an updated cost estimate will be presented in the Supplemental Draft EIS and Final EIS.

Transportation

The access and circulation measures characterize how the options would change residential and business driveways and street access along 112th Avenue. Sound Transit counted the number of residential and business driveways that would be converted from full-access to right-in/right-out in the study area. (Right-in/right-out refers to driveways where vehicle are restricted to turning right into the driveway and right out of the driveway.) Additionally, Sound Transit counted the number of locations along 112th Avenue SE where side street access would change by either closing the access or converting it to right-in/right-out. Sound Transit also counted the number of light rail at-grade street crossings. Crossings could either occur at signalized intersections or through gated crossings.

To measure traffic congestion, Sound Transit completed a traffic modeling analysis to predict the number of intersections on 112th Avenue SE and its cross streets that would fail to meet City of Bellevue LOS standards after the light rail project. At intersections that would fail to meet the City's LOS standards with light rail, Sound Transit would provide roadway improvements to mitigate these impacts. Sound Transit also counted the number of intersections that would not meet the City's LOS standard after these mitigation measures are implemented. The analysis reflects conditions during the afternoon peak period in the year 2030.

Displacements

Sound Transit counted displacements based on properties identified as requiring demolition of buildings. The number of businesses and residences affected was determined based on property site visits conducted during 2007 for the Draft EIS. The number of residences and businesses affected includes the number of individual residences in the case of multifamily housing and the number of individual businesses affected in the case of multiple businesses located in single building or on a single property.

Sound Transit would compensate affected property owners according to the provisions specified in Sound Transit's adopted Real Estate Property Acquisition and Relocation Policy, Procedures, and Guidelines and would comply with the appropriate provisions of the federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended, and the State of Washington's relocation and property acquisition regulations (Washington Administrative Code 468-100 and Revised Code of Washington 8.26).

Transit Noise

Sound Transit conducted a preliminary analysis of potential noise impacts based on criteria defined by the Federal Transit Administration (FTA). The analysis considers light rail noise impacts to residential areas and to other noise sensitive land uses such as hotels and associated outdoor spaces. There are two levels of impact included in the FTA criteria: moderate and severe. The impact criteria for both moderate and severe criteria varies according to the level of existing ambient noise. A severe noise impact can be expected to cause a higher percentage of people to be highly annoyed. See Appendix B for additional discussion of noise basics and noise impact maps.

Noise analysis is based on existing noise measurements in the study area. Six long-term noise-monitoring locations were used for this analysis. Existing noise levels at single-family and multifamily residences along 112th Avenue SE ranged from 70 dBA Ldn for residents directly adjacent to 112th Avenue SE to 60 dBA Ldn for properties farther away from 112th Avenue SE. These noise levels have been used in the noise model to determine impacts.

The analysis used to evaluate the impacts of the options is based upon the change in the environmental noise level due to each option and the number of dwelling units potentially affected by project noise. Input to the noise model for this analysis included the following:

- Noise measurement levels from the Central Link light rail line
- On-board bells sounded at each signalized or gated crossing and sounded when entering or departing a station.
- Warning bells at crossing gates.
- Speed of light rail trains.
- Elevation of properties and topographic features that could affect noise transmission.
- Design of option including track elevations, places where the tracks meet (crossovers) or locations of other special trackwork.

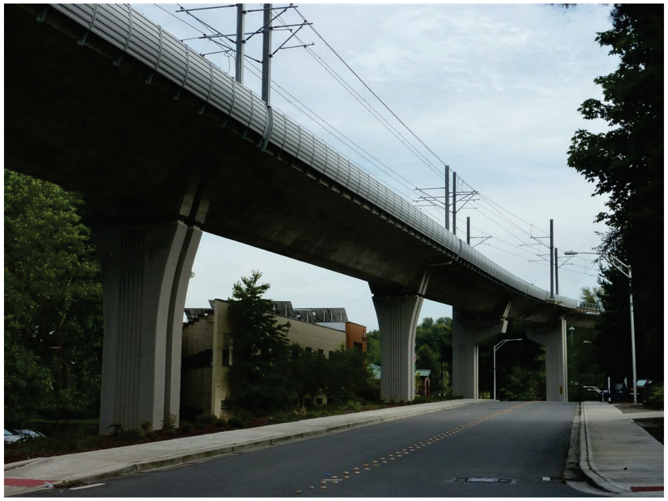

Figure 4. **Example of sound wall on elevated structure**

- Track types assumptions for the noise analysis were:
    - Embedded in roadway for center-running profiles
    - Ballasted (on a gravel bed) for at-grade side-running profiles
    - Direct fixation of rails on concrete for elevated and retained cut/fill profiles

The potential for wheel squeal on curves is discussed qualitatively and was not modeled. Further analysis of noise impacts and mitigation will be conducted during the Supplemental Draft EIS and Final EIS process. The analysis presented in this report is intended for purposes of comparing these options only. Noise mitigation will be developed as the design is advanced. Mitigation can include sound walls, residential sound insulation, special trackwork modifications, track lubrication, and different types of track. Where sound walls or mitigation at the noise source are ineffective, building sound insulation would be used. Building insulation would not reduce noise for outdoor activities. Ballasted track (track constructed on a gravel bed) can reduce noise levels through greater sound absorption compared to embedded track, sometimes called paved track, which is set into the street.

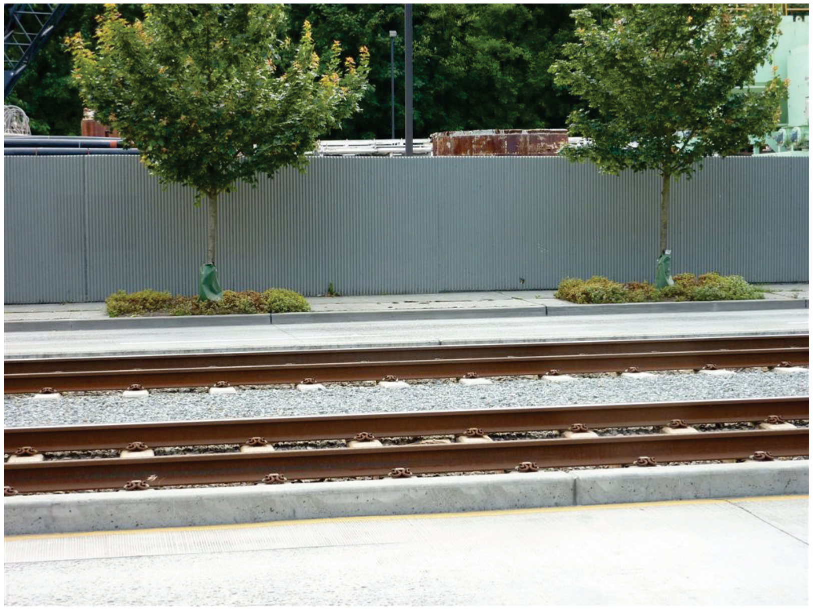

Figure 5. **Example of at-grade sound wall**

Visual

Conceptual illustrations suggesting how each light rail option may look in the corridor are provided in the separately bound Appendix C.

Wetlands

Sound Transit calculated wetland and wetland buffer impacts by overlaying conceptual designs of the alternatives onto maps representing wetland and wetland buffer areas. The identification of wetland and wetland buffer resources in the study area relies on available data from the City of Bellevue. Sound Transit is committed to no net loss of wetlands. None of the proposed options would have wetland impacts, but the options would have varying amounts of buffer impacts along 112th Avenue SE between Bellevue Way and SE 8th St.

Parks

Sound Transit calculated park impacts by overlaying conceptual designs of the alternatives on maps representing park areas provided by the City of Bellevue and confirmed through field work conducted for the 2008 Draft EIS.

All park impacts would be mitigated based on agreements with the City of Bellevue, with one or more of the following mitigation measures:

- Acquiring replacement lands of comparable value and function
- Financial compensation (which could be used to enhance the remaining land)
- Restoration of disturbed park areas
- Other measures as agreed with the City of Bellevue

For property at the Mercer Slough Nature Park purchased through the Land and Water Conservation Fund, mitigation would be implemented in consultation with the National Park Service.

Construction Impacts

Sound Transit developed a qualitative assessment of the disruption to residents, businesses, and street-level activity associated with each option. This measure is intended to highlight the differences in construction disruption to those who live, work, or do business along the 112th Avenue corridor during the most intense construction phases associated with each option. The primary disruptions would include temporary impacts to traffic and access and general disruption (e.g., noise, dust) to adjacent businesses and residents.

Sound Transit also prepared a qualitative comparison of construction duration. Construction duration is affected by construction type and typical production rates for each construction type. The reported qualitative comparison is based on assessment of a typical project comprising the different construction types. The actual construction schedule has not been determined, but would be developed as project design advances.

Evaluation Summary by Option

Option 1: Center Running to Main Street Tunnel

Transportation

Like the other center-running alignments where vehicles can only cross the tracks at signalized intersections, Option 1 would require converting 14 driveways to right-in, right-out and closing one driveway to a property with alternate access. SE 1st Street and SE 4th Street intersections along 112th Avenue SE would remain open, allowing for right-in, right-out movements only. As with all center-running alignments, u-turn movements would be accommodated at SE 8th, SE 6th, and Main street intersections along 112th Avenue SE to continue providing access to all properties.

With Option 1, light rail would have at-grade street crossings at SE 8th Street and SE 6th Street and to and from the center of 112th Avenue SE. With four crossings, Option 1, along with Option 3, would have the most at-grade light rail crossings.

Like the other options, with small changes to intersections, no intersections on 112th Avenue SE would fail to meet the City of Bellevue's LOS standards. An eastbound right-turn pocket could be provided at the intersection of Main Street and 112th Avenue to reduce traffic congestion that would occur with the gated light rail crossing immediately south of this intersection.

108TH AVE NE
112TH AVE NE
Mercer Slough West
Mercer Slough East
MERCER SLOUGH NATURE PARK
118TH AVE NE

Displacements

Option 1 would displace 1 single-family residence—fewer total residential displacements than Options 2 and 6, which would affect more than 40 homes. Option 1 would displace seven businesses, located primarily along the south side of Main Street. This is more than Options 3 and 4 and the same as the remaining options.

Sound Transit would mitigate these acquisitions and displacements as described in the Summary of Methodology and Mitigation by Criteria section of this report.

Transit Noise

As with all options, noise impacts from Option 1 would be mitigated. Option 1 would result in 107 moderate impacts and 21 severe impacts. The severe impacts are associated with the crossover near SE 4th Street and would affect 20 multifamily residences and 1 single-family residence along 112th Avenue SE. The moderate impacts would affect 30 single-family residences, 43 multifamily residences and 32 hotel rooms, tennis courts and the pool at the Bellevue Club Hotel. The single-family residences are primarily located west of 112th Avenue SE between Bellevue Way SE and Surrey Downs Park. The multifamily residences are located at the Bellefields Residential Park and along 112th Avenue SE between SE 4th and SE 1st streets.

The impacts from Bellevue Way to Surrey Downs Park could be mitigated with sound walls on the west side of 112th Avenue SE, sound walls along the tracks and sound insulation where necessary. Mitigation for crossover noise could include the installation of special noise-reducing trackwork. Impacts north of Surrey Downs Park on the west side of 112th Avenue SE could be mitigated with a sound wall adjacent to the tracks, if practical, and/or with sound insulation. The impacts at the Bellevue Club Hotel could be mitigated by a sound wall on the eastside of 112th Ave SE. Mitigation for the upper floors of the hotel may also require sound insulation. There is the potential for wheel squeal at the curve by 112th Avenue and Main St that could be mitigated with track lubrication.

Wetlands and Wetland Buffer

This option would affect 1.3 acres of wetland buffer along the west side of Mercer Slough, the same as with Option 6. This impact is more than with Options 3 and 5 and less than with Options 2 and 4. Wetland buffer impacts would be mitigated through one or more of the following mitigation measures: restoration, enhancement, replacement of wetland buffer or compensation to pre-approved wetland mitigation bank.

Parks

Option 1 Parks Impacts	
Mercer Slough Nature Park	Surrey Downs Park
0.3 acre	0.2 acre

Option 1 would affect 0.5 acre of parklands. 0.3 acre of this impact would be to Mercer Slough Park and 0.2 acre to Surrey Downs Park. Impacts on Mercer Slough Nature Park would be mitigated with one or more of the following measures: acquiring replacement lands of comparable value and function, financial compensation (which could be used to enhance the remaining land), restoration of disturbed park areas, or other measures as agreed with the City of Bellevue. Impacts on

Surrey Downs Park could also be mitigated by financial compensation or replacement land such as development of acquired properties adjacent to and north of the park.

Construction Impacts

Option 1 would be constructed primarily in the center of 112th Avenue with full width roadway reconstruction. Like all options that would operate in the center of 112th Avenue, Option 1 would require a relatively high level of utility relocations, and roadway widening would be required primarily to the east of 112th Avenue SE. Retaining wall structures would be constructed behind the sidewalk on the east side of the roadway. The construction impacts resulting from this type of construction would cause a moderate to higher level of disruption, similar to the other options that operate in the center of 112th Avenue. The duration of construction would be longer than Option 2 and shorter than Option 4, and it would be similar to Options 3, 5 and 6.

Option 2: Westside Running to Main Street Tunnel

Transportation

Option 2 would require closing two driveways to properties with other access already available. The intersection of SE 1st Street and 112th Avenue SE would be closed.

Option 2, along with Option 6, would have three at-grade roadway crossings; it would cross SE 15th and SE 8th streets in side-running areas and cross 112th Avenue SE at SE 6th Street. This is more than Options 4 and 5 and fewer than Options 1 and 3.

Option 2: Westside Running to Main Street Tunnel

112TH AVE NE
Mercer Slough West
Mercer Slough East
118TH AVE NE
MERCER SLOUGH NATURE PARK

As with all options, with small improvements to intersections, no intersections on 112th Avenue SE would fail to meet the City of

Bellevue's LOS standards. A northbound right-turn pocket could be provided at the SE 8th Street and 112th Avenue SE intersection to reduce traffic congestion at this side-running gated light rail crossing.

Displacements

Option 2 would displace 5 single-family residences and 41 multifamily residences, more than would be displaced under Options 1, 3, 4, and 5 and the same as Option 6. Option 2 would also displace seven businesses, primarily along the south side of Main Street. This represents more business displacements than Options 3 and 4 and the same as Options 1, 5 and 6.

Sound Transit would mitigate these acquisitions and displacements as described in the Summary of Methodology and Mitigation by Criteria section of this report, beginning on page 16.

Transit Noise

As with all options, noise impacts associated with Option 2 would be mitigated. Option 2 would result in 42 moderate impacts and 6 severe impacts. The six severe impacts would affect single-family residences due to the crossover near SE 4th Street. The 42 moderate impacts would affect 16 multifamily units at the Bellefield Residential Park, 25 single-family residences, and the tennis courts at the Bellevue Club.

The impacts from Bellevue Way to Surrey Downs Park could be mitigated with sound walls on the west side of 112th Avenue SE along with sound insulation where required. North of Surrey Downs Park, impacts on single-family residences could be mitigated with a sound wall and noise-reducing trackwork at the crossover. Noise impacts at the Bellevue Club could be mitigated with a sound wall. There is the potential for wheel squeal at the curve by 112th Avenue and Main St that could be mitigated with track lubrication.

Wetland and Wetland Buffer

Option 2 would affect approximately 2 acres of wetland buffer along the west side of Mercer Slough. This option, along with Option 4, would have the greatest impact on the wetland buffer. Wetland buffer impacts would be mitigated through one or more of the following mitigation measures: restoration, enhancement, replacement of wetland buffer, or compensation to pre-approved wetland mitigation bank.

Parks

Option 2 Parks Impacts	
Mercer Slough Nature Park	Surrey Downs Park
0.3 acre	1.1 acre

Option 2 would affect the most parkland (1.4 acres), relative to the other options. The impact on Surrey Downs Park, which would be affected by both the light rail alignment and the realignment of SE 4th Street to create a four-way intersection with SE 6th Street and 112th Avenue SE, would be the largest of any option.

Impacts on Mercer Slough Nature Park would be mitigated with one or more of the following measures: acquiring replacement lands of comparable value and function, financial compensation (which could be used to enhance the remaining land), restoration of disturbed park areas, or other measures as agreed with the City of Bellevue. Impacts on Surrey Downs Park could also be mitigated by development of acquired properties adjacent to and north of the park.

Construction Impacts

Option 2 would be constructed on the east side of 112th Avenue SE south of SE 6th Street and on the west side of 112th Avenue SE north of SE 6th Street. Option 2 would require partial roadway reconstruction to accommodate additional traffic turn lanes and to restore areas disrupted by construction activities, and would require fewer utility relocations than other options. Retaining wall structures would be constructed on the outside of the light rail tracks due to existing topography. This option would result in a lower level of construction disruption to the traveling public, businesses, and residents. The construction duration would be the shortest of any option.

Option 3: Center Running to 2nd Street Tunnel

Transportation

Like the other center-running alignments where vehicles can only cross the tracks at signalized intersections, Option 3 would require converting 14 driveways to right-in, right-out and closing one driveway to a property with alternate access. Similar to the driveway changes, the SE 1st Street and SE 4th Street intersections along 112th Avenue SE would remain open, allowing for right-in, right-out movements only. In addition, 111th Avenue NE at NE 2nd Street

would be closed. As with all center-running alignments, u-turn movements would be accommodated at SE 8th, SE 6th and Main street intersections along 112th Avenue SE to continue providing access to all properties.

With Option 3, no intersections on 112th Avenue SE would fail to meet the City of Bellevue's LOS standards.

Displacements

Option 3 would have no residential displacements. It would displace five businesses along the north side of NE 2nd Street. This option, along with Option 4, would have the fewest displacements. Sound Transit would mitigate these acquisitions and displacements as described in the Summary of Methodology and Mitigation by Criteria section of this report, beginning on page 16.

Transit Noise

As with all options, noise impacts associated with Option 3 would be mitigated. Option 3 would result in 98 moderate impacts and 21 severe impacts. The 21 severe impacts would affect 20 multifamily residences and 1 single-family residence near the crossover at SE 4th Street. The moderate impacts would affect 43 multifamily units and 21 single-family residences, along with 32 hotel rooms and the tennis courts and pool at the Bellevue Club Hotel.

The impacts from Bellevue Way to Surrey Downs Park could be mitigated with sound walls on the west side of 112th Avenue SE with sound insulation where necessary. North of Surrey Downs Park, noise impacts could be mitigated with a sound wall for the Bellevue Club Hotel, while impacts to residences along the westside of the tracks could be mitigated with sound walls near the tracks, sound insulation and use of special noise-reducing trackwork at the crossover. There is the potential for wheel squeal at the curve by 112th Avenue and NE 2nd St that could be mitigated with track lubrication.

Wetland and Wetland Buffer

Option 3 would affect approximately 0.4 acre of wetland buffer along Mercer Slough. This option, along with Option 5, would have the least impact on the wetland buffer. Wetland buffer impacts would be mitigated through one or more of the following mitigation measures: restoration, enhancement, replacement of wetland buffer, or compensation to pre-approved wetland mitigation bank.

Parks

Option 3 Parks Impacts	
Mercer Slough Nature Park	Surrey Downs Park
< 0.1 acre	0.2 acre

Option 3 would affect 0.2 acre of parkland. Less than one tenth of an acre of this impact would be to Mercer Slough Park and 0.2 acre would be to Surrey Downs Park. Option 3, along with Option 5, would have the least impact on Mercer Slough Park. Impacts on Mercer Slough Nature Park would be mitigated with one or more of the following measures: acquiring replacement lands of comparable value and function, financial compensation (which could be used to enhance the remaining land), restoration of disturbed park areas, or other measures as agreed with the City of Bellevue. Impacts on Surrey Downs Park could also be mitigated by financial compensation, acquisition of replacement land or other measures as agreed to with the City.

Construction Impacts

Option 3 would be constructed primarily in the center of 112th Avenue SE. Like other options that operate in the center of 112th Avenue, Option 3 would require reconstructing the entire roadway and a greater level of utility relocations. Roadway widening would occur primarily to the east of 112th Avenue SE. Roadway retaining wall structures would be constructed behind the sidewalk on the east side of the roadway. Option 3 would cause a moderate to higher level of construction disruption, similar to other center running options, for a similar amount of time as would occur with Options 1, 5 and 6.

Option 4: Eastside Running to 2nd Street Tunnel

Transportation

Option 4 would require closing two driveways for properties with other access available. It would maintain access at SE 8th and 15th streets before transitioning to a grade-separated eastside alignment.

Option 4: Eastside Running to 2nd Street Tunnel

Mercer Slough West
Mercer Slough East
118TH AVE NE
MERCER SLOUGH NATURE PARK

Option 4, along with Option 5, would have the fewest at-grade light rail crossings because it is grade-separated north of SE 8th Street.

As with all options, assuming minimal intersection improvements, no intersections on 112th Avenue SE would fail to meet the City of

Bellevue's LOS standards. A northbound right-turn pocket could be provided at the intersection of SE 8th Street and 112th Avenue SE to improve traffic congestion at this gated light rail crossing.

Displacements

Option 4 would have no residential displacements and would displace five businesses along the north side of NE 2nd Street. This option, along with Option 3, would have the fewest displacements. Sound Transit would mitigate these acquisitions and displacements as described in the Summary of Methodology and Mitigation by Criteria section of this report, beginning on page 16.

Transit Noise

As with all options, noise impacts associated with Option 4 would be mitigated. Option 4 would result in 31 moderate impacts and 1 severe impact. The severe impact would affect the Bellevue Club pool. Moderate impacts would affect 15 single-family residences and 16 multifamily residences at the Bellefields Residential Park and the Bellevue Club tennis courts. Noise from this option would affect fewer receptors than other options north of SE 6th St because much of the light rail track is located in a retained cut through this area.

The impacts from Bellevue Way to Surrey Downs Park could be mitigated with sound walls on the west side of 112th Avenue SE with sound insulation where necessary. Mitigation for impacts at the Bellevue Club Hotel could include noise walls and special noise reducing track work at the crossover. The curve by 112th Avenue and NE 2nd St is in a tunnel and any wheal squeal is not likely to create impacts.

Wetland and Wetland Buffer

Option 4 would affect 2.1 acres of wetland buffer on the west side of Mercer Slough. This option would have the greatest impact on wetland buffer. Wetland buffer impacts would be mitigated through one or more of the following mitigation measures: restoration, enhancement, replacement of wetland buffer, or compensation to pre-approved wetland mitigation bank.

Parks

Option 4 would affect about 0.3 acre of parkland, all of which would be in the Mercer Slough Nature Park. These impacts would be mitigated with one or more of the following measures: acquiring replacement lands of comparable value and function, financial compensation (which could be used to enhance the remaining land), restoration of disturbed park areas, or other measures as agreed with the City of Bellevue.

Option 4 Parks Impacts

Mercer Slough Nature Park	Surrey Downs Park
0.3 acre	No impact

Construction Impacts

Option 4 would be constructed on the east side of 112th Avenue SE south of SE 8th Street and in a retained cut north of SE 8th Street.

This option would require partial roadway reconstruction to accommodate additional traffic turn lanes and to restore areas disrupted by construction activities, and it would require few utility relocations. For the retained cut area, it would require extensive retaining walls and bridge structures for cross street and driveway access. Option 4 would result in a moderate level of construction impacts for the longest duration, compared to the other options.

Option 5: Center Running to At-Grade

Transportation

Like the other center-running alignments where vehicles can only cross the tracks at signalized intersections, Option 5 would require converting 14 driveways to right-in, right-out and closing one driveway to a property with alternative access. Similar to the driveway changes, the SE 1st Street and SE 4th Street intersections along 112th Avenue SE would remain open, allowing for right-in, right-out movements only. Access to Main Street from 110th Place SE and 110th Avenue SE would be closed.

As with Option 4, Option 5 would have the fewest at-grade light rail crossings because it is grade separated as it crosses to and from the center of 112th Avenue SE.

As with all options, assuming minimal intersection improvements, no intersections on 112th Avenue SE would fail to meet the City of Bellevue's LOS standards. To reduce traffic congestion at the Main Street and 112th Avenue SE intersection, an eastbound right-turn pocket could be provided.

Displacements

Option 5 would displace two single-family homes. This is fewer total residential displacements than would occur under Options 2 and 6, which would affect more than 40 homes, but more than Options 3

Option 5: Center Running to At-Grade

and 4, which would displace no homes. Similar to Options 1, 2 and 6, Option 5 would also displace seven businesses located along the south side of Main Street. Sound Transit would mitigate these acquisitions and displacements as described in the Summary of Methodology and Mitigation by Criteria section of this report, beginning on page 16.

Transit Noise

As with all options, noise impacts associated with Option 5 would be mitigated. Option 5 would result in 116 moderate impacts and 3 severe impacts. The severe impacts would affect two single-family residences and the tennis courts at the Bellevue Club due to the crossover at SE 4th Street. The moderate impacts would affect 20 single-family residences, 63 multifamily residences, 32 hotel rooms at the Bellevue Club, and the Bellevue Club pool.

The impacts from Bellevue Way to Surrey Downs Park could be mitigated with sound walls on the west side of 112th Avenue SE, along with sound insulation where necessary. North of Surrey Downs Park, sound walls on the retained fill, elevated and at-grade segments along Main St would be effective at mitigating most impacts. Additional sound walls, sound insulation, and special noise-reducing trackwork at crossovers would be used to mitigate any remaining noise impacts. Impacts to the Bellevue Club Hotel would be mitigated with sound walls and sound insulation where necessary. There is the potential for wheel squeal at the curve by 112th Avenue and Main St that could be mitigated with track lubrication.

Wetland and Wetland Buffer

Option 5 would affect approximately 0.4 acre of wetland buffer along Mercer Slough. This option, along with Option 3, would have the least impact on wetland buffer. Wetland buffer impacts would be mitigated through one or more of the following mitigation measures: restoration, enhancement, replacement of wetland buffer, or compensation to pre-approved wetland mitigation bank.

Parks

Option 5 Parks Impacts	
Mercer Slough Nature Park	Surrey Downs Park
< 0.1 acre	0.2 acre

Option 5 would have similar park impacts as Option 3, with 0.2 acre of impact. Less than one tenth of an acre of this impact would be to Mercer Slough Park and 0.2 acre would be to Surrey Downs Park. Impacts on Mercer Slough Nature Park would be mitigated with one or more of the following measures: acquiring replacement lands of comparable value and function, financial compensation (which could be used to enhance the remaining land), restoration of disturbed park areas, or other measures as agreed with the City of Bellevue. Impacts on Surrey Downs Park could also be mitigated by financial compensation, acquisition of replacement land or other measures as agreed to with the City.

Construction Impacts

Like other options that operate in the center of 112th Avenue, Option 5 would require full-width roadway reconstruction and a higher level of utility relocations than other options; roadway widening would occur primarily to the east of 112th Avenue SE. Roadway retaining wall structures would be constructed behind the sidewalk on the east side of the roadway. Option 5 would result in a moderate to higher level of construction impacts, similar to the other center running options. The duration of construction would be longer than Option 2, shorter than Option 4, and similar to the other options.

Option 6: Westside Running to At-Grade

Transportation

Option 6 would convert two driveways to right-in, right-out and close four driveways to properties with other access. This is more than Options 2 and 4, which would only affect two driveways, but fewer than the center running options, which would affect 15 driveways. Full access at the SE 1st Street intersection would be maintained because the light rail alignment would be elevated at this location; the intersections at SE 4th Street, 110th Place SE, and 110th Avenue SE would be closed.

Option 6 would have the second most at-grade light rail crossings (3) because its alignment would be at-grade through the SE 8th Street intersection and transition to and from the center of 112th Avenue SE at-grade.

As with all options, assuming minimal intersection improvements, no intersections on 112th Avenue SE would fail to meet the City of Bellevue's LOS standards. A southbound left-turn pocket could be provided at the intersection of SE 6th Street and 112th Avenue SE to improve traffic operations.

Option 6: Westside Running to At-Grade

Displacements

Option 6 would displace 5 single-family residences, 41 multifamily residences, and 7 businesses located along the south side of Main Street. Along with Option 2, this option would have the most total displacements. Sound Transit would mitigate these acquisitions and displacements as described in the Summary of Methodology and Mitigation by Criteria section of this report, beginning on page 16.

Transit Noise

As with all options, noise impacts associated with Option 6 would be mitigated. Option 6 would result in 87 moderate impacts and 9 severe impacts. The severe impacts would affect 7 single-family residences, as well as the Bellevue Club tennis courts and pool due to the crossover near SE 4th Street. Moderate impacts would affect 33 single-family residences, 22 multifamily residences, and 32 hotel rooms.

The residential impacts on the west side of 112th Avenue SE could be mitigated with sound walls. The severe and moderate noise impacts at single-family residences and the Bellevue Club Hotel north of SE 6th St could be mitigated using a variety of methods, including sound walls at-grade and on the retained fill and elevated segments, special noise-reducing trackwork, or sound insulation where necessary. There is the potential for wheel squeal at the curve by 112th Avenue and Main St that could be mitigated with track lubrication.

Wetland and Wetland Buffer

This option would affect 1.3 acres of wetland buffer along the west side of Mercer Slough, which is greater impact than would occur with Options 3 and 5 and less than with Options 2 and 4. Wetland buffer impacts would be mitigated through one or more of the following mitigation measures: restoration, enhancement, replacement of wetland buffer, or compensation to pre-approved wetland mitigation bank.

Parks

Option 6 would affect 1.0 acre of parkland, the second greatest impact among the options. 0.3 acre of this impact would be to Mercer Slough Park and 0.7 acre to Surrey Downs Park.

Option 6 Parks Impacts	
Mercer Slough Nature Park	Surrey Downs Park
0.3 acre	0.7 acre

Impacts on Mercer Slough Nature Park would be mitigated with one or more of the following measures: acquiring replacement lands of comparable value and function, financial compensation (which could be used to enhance the remaining land), restoration of disturbed park areas, or other measures as agreed with the City of Bellevue. Impacts on Surrey Downs Park could also be mitigated by development of acquired properties adjacent to and north of the park.

Construction Impacts

Option 6 would be constructed in the center of 112th Avenue SE south of SE 6th Street and west of 112th Avenue SE north of SE 6th Street. Option 6 would require partial roadway reconstruction, full reconstruction for the center running portion, and minimal roadway work for section on the west side of the roadway. It would require a moderate to lower level of utility relocations compared to the other options. Roadway retaining wall structures would be constructed behind the sidewalk on the east side of the roadway south of SE 6th and outside of the track north of SE 6th. Option 6 would cause a moderate to low level of disruption during construction. The duration of construction would be more than Option 2, less than Option 4, and similar to the remaining options.

EAST LINK TEAM

Appendix B: Location of Sensitive Noise Receptors

Maps showing the locations of sensitive noise receptors for each option are provided for reference after this introduction. The Supplemental Draft Environmental Impact Statement (EIS) and Final EIS will include more information about potential mitigation measures, including the location of noise walls. A combination of noise walls, residential sound insulation, track lubrication, and special trackwork at crossovers would effectively mitigate transit noise impacts for all options. In the case of residential sound insulation, only interior noise impacts would be mitigated, and some residual outdoor noise impacts may remain.

Noise Basics

Human response to noise is subjective and can vary greatly from person to person. Factors that can influence individual response to noise include the loudness, frequency, the amount of background noise present before an intruding noise occurs and the nature of the work or activity (e.g., sleeping) that the noise affects. The unit used to measure the loudness of noise is the decibel (dB). To better approximate the sensitivity of the human ear to sounds of different frequencies, the A-weighted decibel (dBA) scale was developed, known as the A-scale. The A-scale is used in most noise ordinances and standards, including the applicable standards for the East Link Project.

The most basic sound level measurement is the maximum sound level, denoted Lmax. To account for the variance in loudness over time, a common noise measurement, the equivalent sound pressure level (Leq), was developed. The Leq is defined as the energy average noise level, in dBA, for a specific time period (for example, 1 hour). Another useful descriptor is the day-night equivalent sound level, abbreviated Ldn, which is defined as the 24-hour Leq, but with a 10-dBA penalty assessed to noise events occurring at night (defined as 10 p.m. to 7 a.m.). The effect of this penalty is that any event during nighttime hours is equivalent to 10 events during the daytime hours. For example, each train pass-by between 10 pm and 7 am is considered to have the same acoustical energy as 10 daytime trains. This strongly weights Ldn toward nighttime noise to reflect the supposition that most people are more easily annoyed by noise during nighttime hours when background noise is lower and when most people are sleeping.

The smallest change in broadband noise, such as traffic noise, that a human ear can perceive is about 3 dBA. For pure tones, the smallest perceptible change is close to 1 dBA. Most people also perceive an increase of 5 dBA or more as clearly noticeable, while a 10-dBA increase (or decrease) in noise levels is judged by most people as a doubling (or halving when levels decrease) of sound level.

Normal conversation ranges between 44 and 65 dBA when speakers are 3 to 6 feet apart. Quiet urban nighttime noise levels range from 40 to 50 dBA, while nighttime noise levels in an urban area near major roadways typically range from 50 to 60 dBA. Finally, noise levels during the day in a noisy urban area are frequently as high as 70 to 80 dBA.

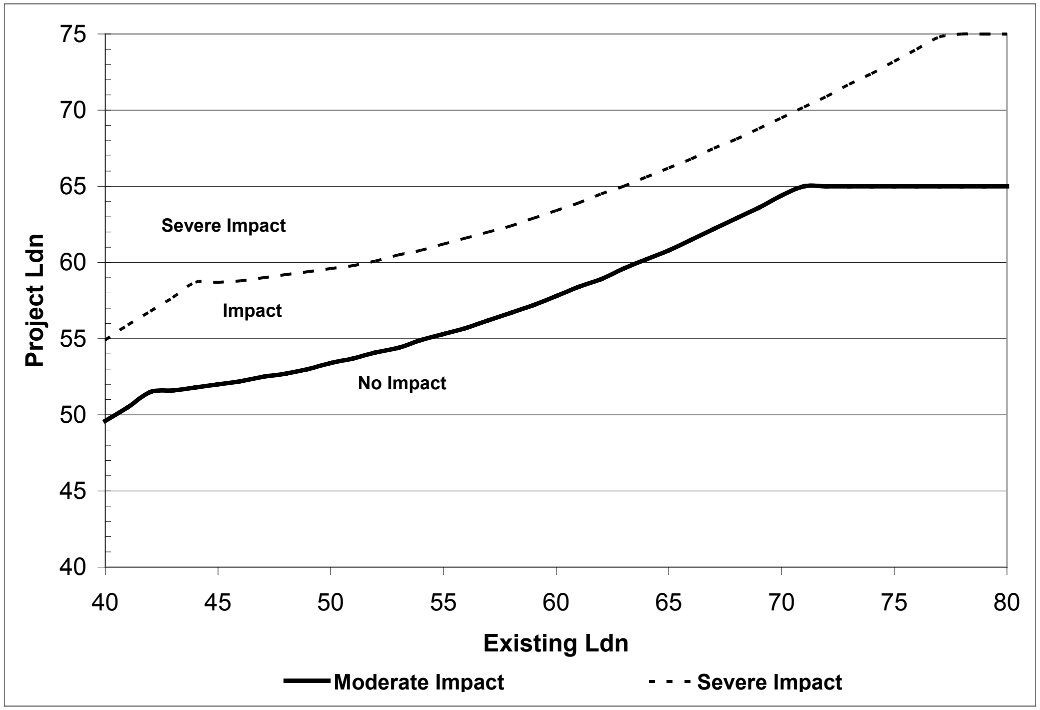
FTA Noise Impact Criteria

The noise criteria in the Federal Transit Administration (FTA) guidance manual for Transit Noise and Vibration Impact Assessment are founded on well-documented research on community reaction to noise and are based on changes in noise exposure using a sliding scale. The amount that the transit project is allowed to change the overall noise environment is reduced with increasing levels of existing noise.

There are two levels of impact included in the FTA criteria: moderate impact and severe impact. The impact threshold for a moderate impact varies according to the level of the existing ambient noise. The severe impact threshold also varies according to the existing ambient noise but is set at levels where a higher percentage of people would be highly annoyed by the project noise. Project noise in the no-impact range is not likely to be annoying to most people. The FTA sliding scale noise impact criteria are illustrated in Figure A-1.

Consider the following as an example of FTA's sliding scale impact criteria related to a residential land use: A location with an existing noise level of 55 dBA Ldn (bottom scale) would have an impact if the transit project noise level (side scale) were between 56 dBA and 61 dBA Ldn; in contrast, a location with an existing noise level of

Figure A-1. **FTA Impact Criteria**



65 dBA Ldn would have an impact if the project noise levels were between 61 dBA and 66 dBA Ldn. Those same environments would have a severe impact if the project levels were greater than 61 dBA Ldn and greater than 66 dBA Ldn, respectively.

Conceptual Illustrations

This appendix has been prepared to support the 12th Avenue Light Rail Options: Conceptual Design Report, June 2010. The illustrations represent the 6 Alignment Options described in the report, plus existing views for comparison.

Conceptual illustrations have been prepared to allow visual comparisons between the Options. Several locations along the routes were selected as View Areas for the illustrations. The conceptual illustrations characterize changes to the general appearance of the areas the options would pass through and depict areas that could be landscaped as well as heights of structures.

The intent of these illustrations is not to depict detailed design related to stations, landscaping, or mitigation opportunities, but to allow a comparison to be made among the six options so that a preferred 112th Avenue option can be identified.

Plan, Section and Three Dimensional views of each Alignment Option are provided for seven View Areas. The views are grouped first by option, then by view area. The View Areas are:

- View Area 1.0: At 112th Ave SE & Bellevue Way looking north
- View Area 1.1: At 112th Ave SE & SE 15th Street looking south

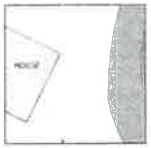
Existing Conditions

Plan, Section and Conceptual Illustrations

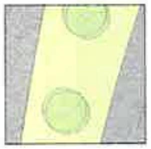
KEY PLAN AND ILLUSTRATED LEGEND

LEGEND

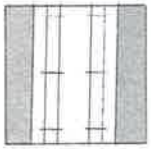
Proposed Sidewalks
Indicated at Conceptual Level only



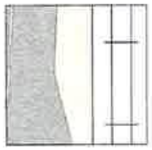
Existing Sidewalks, Curb and Buildings
Existing curbs removed shown dashed



Proposed Planting
Indicated at Conceptual Level only



Proposed Guideway
Areas of ballasted, embedded, and direct fixation track have not been determined



Proposed Median Surface
Areas between guideway and traffic lanes indicated at Conceptual Level only

Proposed Planting Adjacent to Guideway
Light green areas indicate Conceptual Areas of replanting due to construction

Vehicle and Pedestrian Gates

DRAFT Technical Memorandum

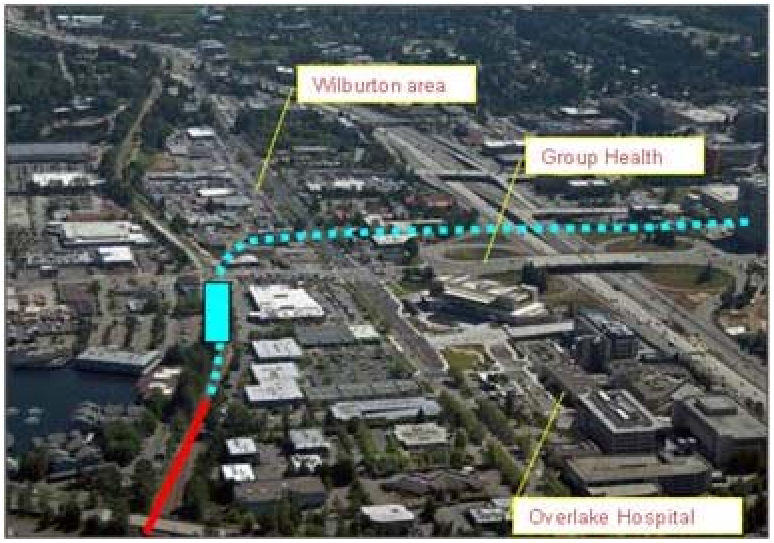
Segment C – Evaluation of Hospital Station Options

June 2010

Prepared For:

SOUNDTRANSIT

CITY OF BELLEVUE WASHINGTON



Wilburton area
Group Health
Overlake Hospital

Prepared By:

CH2MHILL

Sound Transit East Link
Segment C – Evaluation of Hospital Station Options

1. INTRODUCTION

Sound Transit is studying an extension of the region's light rail system from downtown Seattle east to Bellevue and Redmond. The East Link Project would connect the Eastside's biggest population and employment centers, serving 45,000 – 50,000 daily riders, on one of the region's most congested travel corridors. Sound Transit is preparing a Supplemental Draft Environmental Impact Statement (SDEIS) to address new or changed project alternatives. The SDEIS is anticipated to be issued in fall 2010. A final EIS for the East Link Project is scheduled to be issued in spring 2011.

In May 2009 the Sound Transit Board identified a preferred alternative for the East Link project including in Segment C- Downtown Bellevue. Segment C represents the portion of the East Link project that travels and provides service from the dense downtown core of Bellevue to the east side of I-405 along the BNSF corridor (*see Vicinity Map on page 2)*. On April 22, 2010, the Board revised the preferred alternative in Segment C to the C9T – 110th NE Tunnel and C11A-108th At-grade alternatives, which both include a Hospital Station in the BNSF corridor. The April Board Motion also contained the following language:

> "Design options for the location of the Hospital Station in the BNSF corridor at or near NE 8th will be studied and brought back to the Board for consideration."

The Draft EIS published in 2008 presented one option, C1T, for locating the Hospital Station along the BNSF, just north of NE 8th Street. As part of the public involvement process, community comments, value analysis review workshops of the project and a collaborative evaluation by Sound Transit and City of Bellevue staff to screen further refinements, new locations for the Hospital Station were identified for evaluation.

Sound Transit has prepared this Technical Memorandum to present the results of the evaluation of design options for locating the Hospital Station. The findings represented herein are the result of a collaborative process among Sound Transit and the City of Bellevue,. This memorandum provides a basis for comparing the options to one another. It does not include a recommendation, but rather, represents an evaluation of conceptual designs, including estimated order-of-magnitude costs, based on existing data and information.

On July 22, 2010, the Sound Transit Board is expected to identify a preferred option for the Hospital Station after reviewing the information in this memorandum and other input from the City of Bellevue and the community. If the Board's identified preferred location of the Hospital Station is different from the option presented in the DEIS, it would be further studied as part of the Supplemental DEIS. Sound Transit will then complete preliminary engineering and environmental review for the project.

While identifying a preferred option is an important step in the process, it is not a final decision. All of the alternatives in the Draft EIS will continue to be carried forward and evaluated. The Sound Transit Board will select the final East Link route in 2011 after completion of the Final EIS. After the Final EIS, Sound Transit will complete final design, permitting, and construction.

This memorandum includes an overview of each option and the factors that can be used in assessing their relative merits. A summary matrix of the evaluation is provided along with graphics that illustrate the associated features of the station sites along with a discussion of other considerations and tradeoffs that may help with the selection of the preferred Hospital Station location.

2. DESCRIPTION OF OPTIONS

Four potential sites, all located within the BNSF right-of-way, have been identified for the Hospital Station:

SCALE 1" ≈ 500'

Option A: North of NE 8th Street

In this option the elevated center platform station is sited immediately north of NE 8th Street. Access up to the station platform is provided through a set of stairway, escalator and elevator facilities located on an entry plaza directly below. No pedestrian crossing of NE 8th Street at the BNSF corridor for this station is provided as a part of the light rail project. (A pedestrian crossing of NE 8th Street is anticipated as part of the planned King County multi-use trail). Emergency and paratransit access and turnaround is provided from 118th Avenue NE just north of NE 8th Street.

An additional pedestrian access (applicable to Options A, B, and C) could be provided by acquiring property easements for an east-west walkway from 116th Avenue NE to the BNSF right-of-way in the vicinity of the north end of Whole Foods. This additional pedestrian access is reflected as an add-on and is not included in the base cost estimates.

Option A was the station location shown in the Draft Environmental Impact Statement (DEIS) and is the baseline station site against which the other three location options are compared, including differences in estimated cost.

Option B: Span NE 8th Street

In this option the elevated center platform station straddles NE 8th Street and access is provided from both sides of the street. Vertical circulation – stairway, escalator and two elevators - is provided for each entry point at ground level. Emergency and paratransit access is provided from the 118th Avenue NE right-of-way just north of NE 8th Street. Additional pedestrian access could be provided with and east-west easement in the vicinity of Whole Foods (*see Option A above*).

Option C: South of NE 10th Street

In this option the elevated center platform station is sited approximately 300 feet north of NE 8th Street. The primary access is provided from the north side of NE 8th Street along the BNSF corridor through a pedestrian walk that connects to the ground level entry plaza. Emergency and paratransit access is provided with a driveway from the north side of NE 8th Street through the 118th Avenue NE right-of-way to a turnaround adjacent to the east side of the station. Additional pedestrian access could be provided with an east-west easement in the vicinity of Whole Foods (*see Option A above*).

Option D: At-Grade North of NE 10th Street

In this option an at-grade station is sited approximately 800 feet north of NE 8th Street. Due to track alignment constraints immediately north of the station, side platforms are used with this option. Access is provided from 116th Avenue NE by a ground-level pedestrian walkway that connects to the westbound and eastbound platforms. Emergency and paratransit access is provided from 116th Avenue NE by a driveway and turnaround immediately adjacent to and north of the pedestrian walkway.

Other Corridor Facilities

Existing facilities in the BNSF corridor that will need to be accommodated with the siting of the Hospital Station include a 72-inch King County Metro sanitary sewer interceptor, a fiber-optics conduit owned by Allstream, and Sturtevant Creek, which flows from the south end of Lake Bellevue southerly along the east side of the corridor in an open channel and crosses to enter a culvert just north of NE 8th Street. The creek would be protected during construction and be restored to its open channel condition once construction is complete. Additional piping of the creek is not allowed under the City of Bellevue's current Code. This area is also adjacent to a floodplain, and measures will need to be taken so that flood capacity would not be reduced with station facilities or fill. Cascade Water Alliance plans to construct a 72-inch water transmission line in the corridor and an envelope for potential freight rail operations or a regional multi-use trail must be provided. King County has purchased an easement along the BNSF corridor for the purpose of providing a regional pedestrian and bicycle trail. This easement could be converted to freight rail at some future time. (*see Typical Corridor Cross Section on p. 5*).

These elements represent constraints on the location of the light rail alignment that determine the siting of the Hospital Station facilities and the subsequent impacts to adjacent properties. Sturtevant Creek would need to be maintained as an open channel and, based on feasibility, it is possible that Sturtevant Creek could ultimately be relocated along the proposed water transmission line.

3. EVALUATION CRITERIA

In the analysis of station options Sound Transit established a set of criteria against which the station options can be measured for comparison purposes. The methodologies presented here are preliminary and are useful only for comparisons among the options studied. The Final EIS and Supplemental Draft EIS will present more complete impact analyses and mitigation strategies for the preferred option.

Cost

A qualitative comparison of the costs is provided in this memorandum. The comparison is to Option A: North of NE 8th Street. The differences reflect whether the station is at-grade, elevated north of NE 8th or spanning NE 8th; the length of elevated guideway; and the extent of right-of-way acquisition.

Station Characteristics

Elements which define a station and may be used to compare the different site options include: 1) vertical orientation (elevated or at-grade); 2) quality of the patron experience (access, walk time, perceived safety and comfort); 3) spacing between adjacent stations in the light rail line; and 4) visibility of the station from the street (pedestrian connectivity and security of passengers and facility).

1. The elevated stations with a center platform afford direct access to either eastbound or westbound light rail with no crossing of the light rail tracks required. The at-grade station in Option D is a side platform station which requires passengers to cross the light rail tracks to access the north(east) bound platform.

2. The quality of patron access to a station is affected not only by the walk time, but also by the directness of the route, crossing of major streets, the quality of the pedestrian environment, and any grades encountered. The BNSF right-of-way crosses NE 8th Street

At-Grade Station

Typical Corridor Cross Section

at a perpendicular angle at the same grade. Further north along the BNSF right-of-way the grade difference between the light rail alignment and connection to the parallel 116th Avenue NE becomes an important consideration (the elevation difference between 116th Avenue and the station platform of Option D is 21.5 feet). As the station is located further away from public streets the perception of accessibility diminishes and potentially becomes non- apparent.

3. The siting of station Option D potentially creates an overlap of ridership capture with the 120th Avenue Station to the northeast, which may diminish the effectiveness of system operation. (*see Station Spacing Diagram on p. 7*). This siting also diminishes access from ridership south of NE 8th. (see following discussion on walking distance).
4. Patron security can be enhanced by the techniques of "Crime Prevention through Environmental Design" (CPTED), which influences the visibility and orientation of a station to emphasize "eyes on the station". The station options that are closer to major public areas, closer to higher activity areas, or provide a greater sense of being visible provide a greater sense of security. They also facilitate the opportunity for security personnel as well as local police to efficiently monitor the station areas. Visibility of a station can also affect ridership, as greater visibility enhances ridership by attracting more riders to use the transit mode.

Walk Analysis

A walk distance analysis was performed to better understand the differences in land use accessibility for each of the station options. (*see Walk Analysis Maps on p. 8*). The City of Bellevue analyzed the percent of 2030 Wilburton/Medical Office area employment and residential population within a 5-minute and 10-minute walk distance of each station location. The 5-minute walk represents a higher-capture, roughly 1/4-mile distance for transit users. The 10-minute walk represents an approximate 1/2-mile distance as identified in the Bellevue Light Rail Best Practices Report and reflected in the City's Comprehensive Plan. (The Downtown Subarea and Spring District are not included in the land use calculations because they would be served more directly by other planned stations.)

Vertical circulation time penalties of 30 to 60 seconds were included in the analysis of the four station options (representing the time it would take to travel from the platform to the pedestrian network connecting to the station). The walk distances follow a pedestrian network assumed to be in place by 2030. Sidewalks and off-street pedestrian paths, including use of an anticipated multi-use path in the BNSF corridor, are included as pedestrian routes. The analysis includes use of the two east-west pedestrian connections from the stations on the BNSF to 116th Avenue. An east-west connection north of the Design Center in Option D is used to provide access to 116th Avenue. An optional east-west connection through the northern part of Whole Foods provides pedestrians direct access to 116th Avenue in lieu of traveling south, then east-west along NE 8th Street.

The analysis does not include travel distance reductions for intersection delay. Much of the intersection delay would occur at NE 8th Street and 116th Avenue crosswalks. Pedestrian crossing of NE 8th Street at the BNSF right-of-way would occur as part of the station in Option B. For the other three options, it is assumed this crossing would be addressed separately

through the planned regional multi-use trail development in the BNSF corridor (and not part of the Sound Transit work plan).

Hospital Access

The three existing hospitals located on the east side of I-405 along 116th Avenue NE (Overlake Hospital, Group Health and Children's Hospital) all have the potential to be served by light rail. To gauge the differences in how well each hospital could be served, an analysis was performed to measure the shortest walk distance from the front door of each hospital to the closest station entrance by option. As with the land use accessibility analysis, the hospital analysis uses the east-west pedestrian connections from the station entrances to 116th Avenue. The shortest walk distances to Children's Hospital from the Hospital Station options are shown for two distinct routes: one that uses 116th Avenue for primary access; and another that uses an anticipated multi-use path in the BNSF corridor. The walk distance from the 120th Avenue Station via a new NE 15th Street connection is also shown because of its proximity to Children's Hospital. (*see figures on p. 10*).

Potential Environmental Impacts

Property impacts associated with the Hospital Station options include full and partial property acquisitions from commercial and residential properties for the project and its construction.

Sound Transit counts displacements based on properties identified through the design process.. The number of affected businesses adjacent to the BNSF corridor was determined based on property site visits conducted for the Draft EIS. The number of businesses affected includes the number of individual businesses located in a single building or on a single property. Between 1 and 5 business displacements have been identified but no residential displacements are anticipated for any of the four Hospital Station options.

Sound Transit would compensate affected property owners according to the provisions specified in Sound Transit's adopted Real Estate Property Acquisition and Relocation Policy, Procedures, and Guidelines and would comply with the appropriate provisions of the federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended, and the State of Washington's relocation and property acquisition regulations (Washington Administrative Code 468-100 and Revised Code of Washington 8.26).

Adjacent to the light rail alignment immediately to the east are several multifamily residences on Lake Bellevue. While the Draft EIS predicted that these units would have noise impacts from the project, after mitigation it was predicted that the impacts would be reduced to meet FTA standards. For the new options under consideration, the noise analysis has not been updated because the location of the light rail alignment does not substantially change. However, Sound Transit operating procedures require that the bell on the train be rung when entering and exiting a station. Given that the Option D station is located the closest to the multifamily residences, noise from train bells may affect the multifamily buildings more with this option compared to the other options. Also, the side platform station configuration requires passengers to cross the light rail tracks to access the station, whereas the elevated center platform options do not. This would require additional crossing bells and signals to ensure passenger safety that are not required at the other station options.

Option D

Hospital Access

As previously discussed, measures would be developed to protect Sturtevant Creek during construction. After construction, the creek would remain in an open channel, consistent with City of Bellevue regulations.

Construction Risk and Effects

Sound Transit has developed a qualitative assessment of the disruption to residents, businesses, and street-level activity associated with each option. This measure is intended to highlight the differences between the most intense construction phases for each option during the time that those who live, work, or do business in the surrounding environs would most likely be affected by construction activities.

Construction duration is determined by construction type and typical production rates for each type. The reported qualitative comparison is based on assessment of a typical project comprising the different types. The actual construction schedule will depend on the type of construction, timing of the start of construction, and other factors that will not be known until final design. The size and location of property designated for construction staging relative to the station site will have a bearing on the temporary impacts to adjacent properties and ease and duration of construction.

4 TRANSIT-ORIENTED DEVELOPMENT

The City of Bellevue has identified six specific areas in the vicinity of the hospital Station options that have the potential to support existing and future transit-oriented development (TOD) (*see TOD Areas Map on p. 12*). The current forecast is for approximately 10,300 total jobs in these six areas by 2030 along with roughly 1,425 residents. High, Medium and Low rankings have been used to assess each of the areas by station location options (*see TOD Assessment on p. 13*).

Area 1: Medical Institution District and Medical Office area north of NE 12th Street, including Children's Hospital.

Area 2: Medical Institution District west of 116th Avenue south of NE 12th Street, including Group Health and Overlake Hospital Medical Center.

Area 3: Medical Office east of 116th Avenue NE south of NE 12th Street, primarily zoned for high-rise medical office.

Area 4: Lake Bellevue/Brierwood Center, zoned for low-rise commercial and mid-rise mixed use development.

Area 5: Wilburton Opportunity Are west of BNSF; the City's Comprehensive Plan anticipates transit supportive land uses.

Area 6: Wilburton Village east of BNSF; the City's Comprehensive Plan supports mid-rise, mixed use redevelopment.

5. SUMMARY OF STATION OPTIONS

The *Summary Matrix on page 15* presents the measures and qualitative ratings for each option according to the evaluation criteria. The following is a discussion of the key differentiating features for each station location. (*see Station Plans on pages. 18-21*).

	AREA 4: Lake Bellevue / Brierwood Center; zoned for low-rise commercial and mid-rise mixed use development.	Medium	Medium: similar to Option A.	Medium: similar to Option A.	Low to Medium
	AREA 5: Wilburton Opportunity Area west of BNSF; City's Comprehensive Plan anticipates transit supportive land uses.	Medium to High	High	Medium to High	Low
	AREA 6: Wilburton Village east of BNSF; City's Comprehensive Plan supports mid-rise, mixed use redevelopment.	Medium to High	High	Medium to High	Low

Option A: North of NE 8th Street

The elevated station is visible from NE 8th Street, served by a ground level entry plaza on the north side of NE 8th Street on which the vertical access facilities are located. This is accompanied by a paved emergency vehicle and paratransit access driveway and turnaround connecting to NE 8th Street. For the station plaza area, vehicle access and turnaround, and construction staging, adjacent property on the east side of the corridor would need to be acquired. Several businesses are displaced, while parking for other businesses that remain is reduced. The sanitary sewer interceptor would remain within the existing BNSF right-of-way; however, a portion of the proposed water transmission line is anticipated to lie within property to be acquired by Sound Transit for the project.

While the primary station entry is from the north side of NE 8th Street, an additional station entry could be provided from NE 116th Avenue, north of Whole Foods. Right-of-way would be acquired to accommodate a 14-foot wide walkway that connects to the ground level station plaza by ramp to make up the elevation difference. A second set of fare vending equipment would be required to serve this secondary entry. All costs would be considered add-on.

- Option A is the baseline for the comparison of alternatives. Option A would provide a high degree of visibility with its location adjacent to NE 8th Street (one of the City's primary arterials) and reasonable access to Wilburton areas south of NE 8th. Hospital access would be moderate via NE 8th Street and could be enhanced with a secondary station entry north of Whole Foods, at additional cost.

Option B: Span NE 8th Street

The elevated station is the most visible from NE 8th Street (as it is directly above the street), and is served by ground level plazas on both the north and south sides of NE 8th. Similar to Option A an alternate station entry could be provided from NE 116th Avenue by a pedestrian access right-of-way. The pedestrian walkway would be more extensive as the station is shifted farther south, with approximately 320 feet paralleling the area reserved for freight rail or multi-use trail; however, no additional ticket vending equipment would be necessary. As with the alternative entry in Option A this pedestrian walkway would cross the potential freight rail track west of the station plaza. Due to the more restrictive alignment geometry to accommodate shifting the station south to straddle NE 8th Street, the operating train speed for the south approach would be reduced from 30 mph to 20 mph.

Right-of-way acquisition for the entry plaza, vehicle access and turnaround, and construction staging is reduced from that required for Option A; however, property would be acquired south of NE 8th Street for staging construction of the southern portion of the station. There would be additional construction risk and impacts to the public for building the station over 8th Street. More extensive traffic control and construction sequencing of station elements over the street, coupled with public and worker safety, create greater complexity for this option.

- Option B's location straddling NE 8th with access points on both sides of the street provides it with the greatest visibility and the broadest land use accessibility. The more complex design of locating the station over the street results in higher cost than Option A. It provides the most direct access to the Wilburton area south of NE 8th Street and its additional northern station entrance provides access to the hospitals. Like Option A, hospital access could be further enhanced with an alternative station entry north of

SUMMARY – Evaluation of Hospital Station Options

Criteria	Measure	Option A: North of NE 8th St	Option B: Span NE 8th St	Option C: South of NE 10th St	Option D: At-Grade, North of 10th
Cost	Difference from baseline (Option A)	---	*Slightly more*	*Slightly more*	*Less*
Station Characteristics (Options A, B, C elevated)	Station spacing (from 120th Avenue Station)	3000 ft	3200 ft	2800 ft	2100 ft
	Station visibility	High	Highest	Moderate	Low
	Quality of connection (safety, comfort, design of pedestrian environment)	Moderate	High	Moderate	Low
Walk Analysis Wilburton/Medical Office area land use accessibility (based on 2030 forecast for TOD areas – see map)	Percent of jobs within 5-minute walk	50%	53%	50%	35%
	Percent of jobs within 10-minute walk	83%	84%	84%	84%
	Percent of population within 5-minute walk	28%	42%	28%	0%
	Percent of population within 10-minute walk	99%	99%	99%	53%
Hospital Access Shortest distance from station entrance to front door of specific medical facility	Group Health - assumes use of additional pedestrian access for connection from BNSF to 116th Ave for Options A, B and C	900 ft	1,175 ft	825 ft	1.450 ft
	Overlake Hospital - assumes use of one of two potential pedestrian connections from BNSF to 116th Ave	1,475 ft	1,750 ft	1,400 ft	1,300 ft
	Children's Hospital – (1) via 116th Ave with connection from BNSF; (2) via BNSF corridor assuming connection to Children's Hospital; and (3) distance from 120th Avenue Station via new NE 15th Street	2,500 ft 2,575 ft *(1,700 ft)	2,775 ft 2,850 ft *(1,700 ft)	2,425 ft 2,500 ft *(1,700 ft)	2,100 ft 1,750 ft *(1,700 ft)
Environmental impacts	Displacements	5 businesses	5 businesses	1 business	0
Construction risk	Relative risk to schedule and budget	Moderate	Higher	Moderate to Higher	Lower
Construction effects	Intensity of impacts to existing activities	Moderate	Moderate to High	Moderate	Moderate to Low
	Construction duration	Intermediate	Longest	Intermediate	Shortest

Whole Foods, at additional cost. Option B may increase the complexity of a future grade-separated crossing of NE 8th Street by the planned multi-use trail.

Option C: South of NE 10th Street

The south end of this elevated station is located approximately 300 feet north of NE 8th Street with lower visibility than Options A or B. Access to the station is provided by a walkway that would parallel the area reserved for freight rail operations (or a multi-use trail) for approximately 500 feet before crossing to the entry plaza. Similar to Options A and B an alternative station entry connecting the plaza to 116th Avenue NE by walkway and ramp could be added on. The emergency vehicle and paratransit access serving the station is connected to NE 8th Street by a 300-foot long driveway within the 118th Avenue NE right-of-way.

Although property would be acquired for the emergency and paratransit turnaround and construction staging, this station option would preserve the property and businesses located at the northeast quadrant of NE 8th Street and the BNSF. However, due to the slightly more skewed approach to the BNSF corridor for the LRT alignment, acquisition of property at the southwest quadrant of the NE 8th/BNSF intersection and displacement of one business would be required. Additionally, because of a pinch point created by the alignment within the BNSF corridor north of the station, a portion of the 72-inch sanitary sewer interceptor would need to be relocated, including acquisition of right-of-way or easement by the project. It should also be noted that a portion of the planned water transmission line would potentially require an easement or right-of-way across the property at the northeast quadrant at the utility owner's cost.

- Option C, consisting of an elevated station north of NE 8th Street, would have costs, advantages and disadvantages similar to Option A. Its more northern location avoids four business displacements. Without the additional station entry the access to the hospital facilities is made worse than Options A and B. This station is less visible and provides less access to the Wilburton areas south of NE 8th.

Option D: At-Grade, North of NE 10th Street

The at-grade station is located approximately 1,100 feet north of NE 8th Street, with pedestrian access provided by a 500-foot long walkway from 116th Avenue NE that would share the paved right-of-way to be acquired with emergency and paratransit access. Although the station is described as "at-grade", since no elevators or stairs are required, there is a substantial grade difference between the existing elevation of the BNSF corridor and the adjacent property on the west and the station would actually be situated on several feet of fill.

The entry plaza for the station would be sited immediately west of the BNSF and contain bicycle parking, paratransit shelter, and emergency vehicle access. Because of geometric requirements of the alignment north of the station location (routing under the NE 12th Street overpass for connection to Segment D as well as location of the junction for a potential future extension to Kirkland), the separation between the light rail tracks must be minimized and side platforms are thereby required. Pedestrians would need to cross both the area reserved for freight rail operations or multi-use trail and the light rail tracks in order to access the platforms.

Property adjacent to the west side of the corridor would be acquired for construction staging as well as the entry plaza and vehicle access and turnaround. The walkway is defined as 14-feet wide while the vehicular access is 22 feet; the resulting 36-foot wide right-of-way would likely eliminate the row of surface parking adjacent to the existing parking structure to the north. On the east side of the BNSF right-of-way space is very constrained; although there would be sufficient width for the proposed 72-inch water transmission line construction may be challenging and temporary easements may be required. The proximity of Lake Bellevue to the station and water line may be an issue and special considerations (shoring, dewatering, etc) would need to be investigated for final design and construction.

- Option D is the lowest cost option and provides the most direct access to Overlake Hospital and Children's Hospital. Located approximately 1,100 feet north of NE 8th Street in the BNSF corridor, the station would be accessed by a 500-foot long entry way connecting to 116th Avenue NE, making the station the least visible. The station would also provide the least access to Wilburton areas south of NE 8th and result in a substantial overlap in service with the 120th Avenue Station. The side platform configuration dictated by the alignment geometry requires passengers to cross the light rail tracks to access the station, whereas the elevated center platform options do not. This would require additional crossing bells and signals to ensure passenger safety that are not required at the other station options. Given that the Option D station is located the closest to the multi-family residences, noise from bells on trains entering and exiting the station may affect the nearby multi-family building the most with this option compared to the other options.

6. NEXT STEPS

The Sound Transit Board is expected to identify a preferred station option on July 22, 2010. If the Board's preferred location of the Hospital Station is different from that considered in the DEIS, it would be further studied in a Supplemental DEIS, which is scheduled to be published in fall 2010. The Final EIS and Supplemental DEIS will present more refined costs and more complete impact analyses for the preferred option.

In addition to technical work, Sound Transit and the City of Bellevue will engage community members and stakeholders in public outreach meetings and opportunities to provide comment.

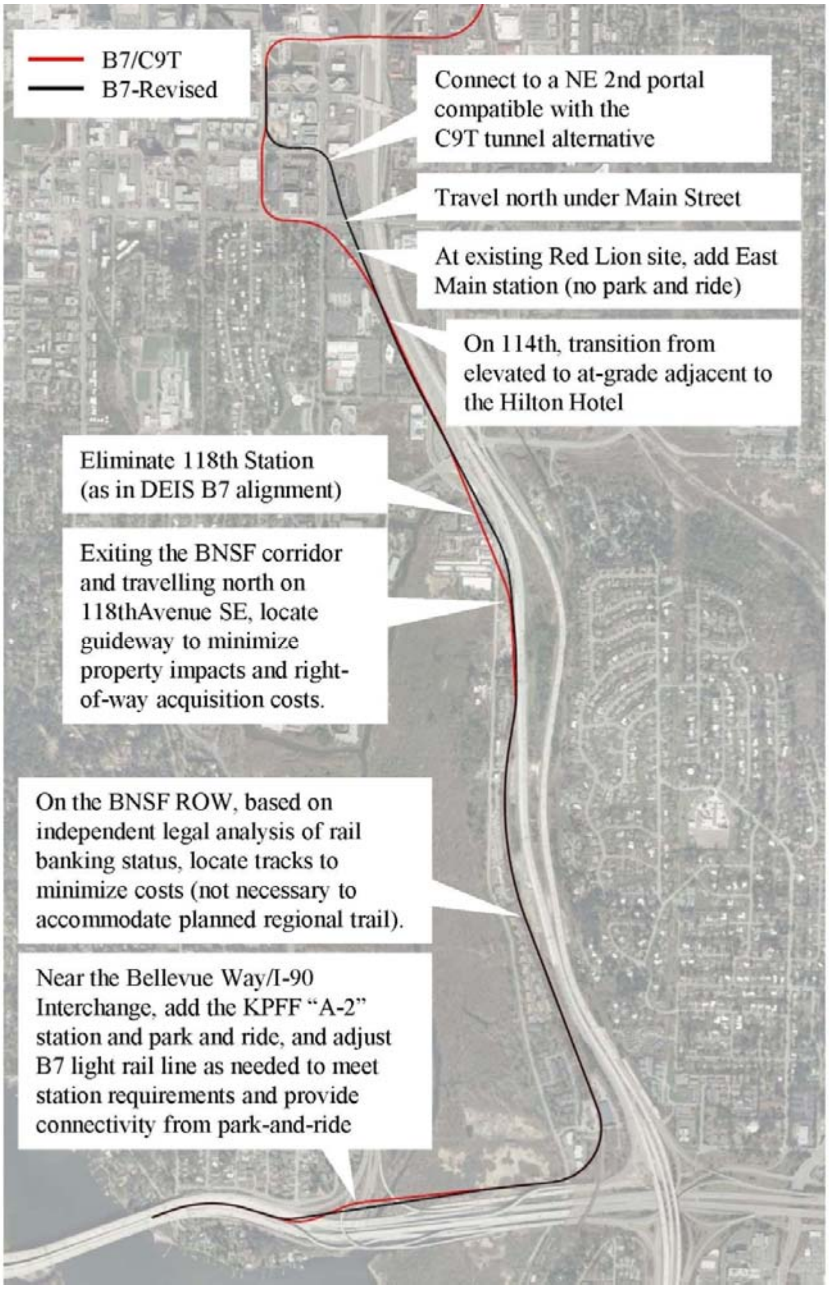
Executive summary

Bellevue City Council has initiated the development of a concept design for an alternative to the B7 and C9T alternatives studied by Sound Transit in the DEIS and SDEIS for the East Link project. The objectives of the additional analysis are to improve performance, to reduce impacts, and to reduce costs, as compared with the Sound Transit B7 and C9T alternatives. The revisions to the B7 and C9T alternatives that Council requested be incorporated into the new alignment are identified in the Figure 1 below.



B7/C9T
B7-Revised
Connect to a NE 2nd portal compatible with the C9T tunnel alternative
Travel north under Main Street
At existing Red Lion site, add East Main station (no park and ride)
On 114th, transition from elevated to at-grade adjacent to the Hilton Hotel
Eliminate 118th Station (as in DEIS B7 alignment)
Exiting the BNSF corridor and travelling north on 118thAvenue SE, locate guideway to minimize property impacts and right-of-way acquisition costs.
On the BNSF ROW, based on independent legal analysis of rail banking status, locate tracks to minimize costs (not necessary to accommodate planned regional trail).
Near the Bellevue Way/I-90 Interchange, add the KPFF "A-2" station and park and ride, and adjust B7 light rail line as needed to meet station requirements and provide connectivity from park-and-ride

Figure 1 - B7-Revised revisions to B7 and C9T alternatives

The alignment for the alternative, the B7-Revised alternative, commences on the east side of the I-90 Lake Washington Bridge and follows the north side of I-90 to the I-405 where it turns north, parallel with the I-405. At NE 2nd Street the alignment turns west towards the proposed Bellevue Transit Center Station. The northern terminus of the study is at the south end of the proposed Bellevue Transit Center Station. A new station and park-and-ride will be located at the south end of Bellevue Way, and a second new station will be located near the Red Lion Hotel site.

The alternative has been developed to optimize ridership while minimizing construction costs, property impacts and environmental impacts.

Following an optimization meeting with City staff in which a number of options for each segment of the alignment were discussed and preferred options identified, a concept alignment, and station designs, were developed.

Two alignment options were developed for the BNSF corridor adjacent to the I-405, in which a future freight operator would either share the light rail tracks or establish a dedicate freight line in a prepared corridor alongside the light rail tracks.

The concept design was subject to an early environmental screening to allow an early assessment of the alternative and to provide early comparison with the Sound Transit B7 and C9T alternatives. This screening includes:

- Cost Estimate
- Right of Way and property impacts
- Ridership
- Transportation impacts at the A-2 Station
- Environmental/ecology impacts

The team reached out to stakeholders (Sound Transit, WSDOT, King County) to obtain base information along the corridor and relevant input on the development of the alternative.

A public involvement program was established and two well-attended public open houses were held to obtain community input and comment.

Draft

Key Findings

- The B7-Revised is a feasible alternative that improves ridership over the B7/C9T alternative but has a higher project cost. The alternative has similar property impacts and has a number of additional environmental impacts relative to the B7 and C9T alternatives. A summary of the early screening analysis is provided below.

Features	B7-Revised	B7/C9T
Estimated cost (millions, 2007 $)	$894.00	$883.80
2030 Daily Ridership (project-wide)	50,500	49,000
Noise-impacted receptors - unmitigated (mitigated)	237 (0)	182 (0)
Residential displacements (number of housing units)	12	0
Business displacements (number of employees)	215	268
Full/partial property acquisitions	35	34
Wetlands/wetland buffer affected (acres)	1.8/0.8	2.1/1.0
Parks/Section 4(f) and 6(f) (acres before mitigation)	1.1	1.3

- The most substantial environmental differentiators of B7-Revised compared with B7/C9T are the following:
  - More wetland and park impacts associated with the A-2 Station and park-and-ride.
  - More pollutant-generating impervious surface related to A-2 Station and park-and-ride.
  - Change in visual quality overall at the A-2 Station and park-and-ride.
  - More disturbance of special-status fish species and good quality stream habitat in Sturtevant Creek.
- The A-2 Station requires a number of traffic mitigation measures at Bellevue Way:
  - Ramp access to station from east side of Bellevue Way.
  - Additional right-turn lane at north end of SE 30th Street.
  - Traffic signal to control the southbound and eastbound movements at the intersection of Bellevue Way and SE 30th Street.
  - Third lane on the southbound approach on Bellevue Way to SE 30th Street.
  - Pocket lane on Bellevue Way northbound south of station access.
  - Acceleration lane onto Bellevue Way northbound.
- The provision of a dedicated freight corridor in the BNSF corridor represents a similar cost to the shared track scheme and provides fewer restrictions on Sound Transit and the freight operator in operating in the corridor.
- The construction method and foundation scheme for the Mercer Slough crossing will require further work to develop a robust solution and to address WSDOTs concerns regarding risks to their existing I-90 facilities.

1 Introduction

1.1 Project description

The East Link project is an extension to Sound Transit’s Link light rail system that will provide light rail service across Lake Washington, linking Seattle, Bellevue, and Redmond (Overlake).

For the segment of East Link between the Lake Washington crossing and downtown Bellevue, Sound Transit has developed the B7 alternative to a conceptual engineering level of design (approximately five percent design) as part of the Draft Environmental Impact Statement (DEIS) for the project which was issued in December 2008.

A Supplemental Draft EIS, which analyzes new alternatives developed since the DEIS, was published in November 2010. That supplemental document includes updated conceptual engineering for the Sound Transit B7 alternative and a C9T alternative that could connect B7 to a station at the Bellevue Transit Center. A Final EIS is expected in the summer of 2011.

At the September 13, 2010, Bellevue City Council Study Session, the council discussed the need for design variations and for additional analysis of revised East Link B7 and C9T alternatives. The objectives of the additional analysis would be to improve performance, to reduce impacts, and to reduce costs, as compared with the Sound Transit B7 and C9T alternatives. As a result of that discussion the council initiated the development of a modified B7 alternative (“B7-Revised”). The council directed City staff to develop an “apples-to-apples” comparison of the Sound Transit B7 and C9T alternatives with a B7-Revised alternative. ARUP were commissioned by the City to develop the B7-Revised alternative.

The B7-Revised alternative begins at the transition from East Link Segment A to Segment B at the east shore of Lake Washington and connects with a new elevated station (A-2 Station) over south Bellevue Way/I-90 ramps. The alignment continues east from the station along the north side of I-90 and turns north into the BNSF corridor with an at-grade profile. The alignment transitions to elevated as it leaves the BNSF corridor, crosses over SE 8th Street, and transitions back to at-grade prior to a new station (East Main Station) just south of Main Street on the current Red Lion Hotel site. The alignment crosses under Main Street and turns west on the current Sheraton Hotel site before entering a tunnel portal at NE 2nd Street. The B7-Revised alternative is approximately three miles long with a combination of at-grade, elevated, and open-cut sections.

Draft

1.2 Scope of report

1.2.1 The study

The scope of the study is to develop a concept alignment for the B7-Revised alternative, and a concept design for an associated station on South Bellevue Way, and to carry out environmental screening of the alternative with assessments of the following:

- Ridership
- Property and right-of-way (RoW) impacts
- Transportation and traffic impacts
- Visual impacts
- Noise impacts
- Environmental/ecology impacts
- Cost estimate
- Constructability

The scope also includes the development of a public involvement program comprising up to three open houses to engage the community in the study.

After commencement, the extent of the study was extended in two areas:

BNSF Corridor

In the BNSF corridor two options were developed and screened:

- Shared Track Option – This provides two light rail tracks that could be shared in the future with a freight operation. A regional trail was not considered in this option.
- Additional Freight Corridor Option – This option would provide an 18-foot corridor alongside the light rail tracks, in which a dedicated freight operation could be established in the future. As an interim use of the 18-foot future freight rail corridor, a regional trail could be established.

Extension to Bellevue Transit Center Station

To allow a comparison of the B7-Revised with the B7 and C9T alternatives the northern extent of the study area was extended to the south end of the Bellevue Transit Center station where the B7-Revised alignment ties in with the C9T alignment.

1.2.2 Report objectives

This report represents an interim analysis of the work carried out to date to assess the feasibility of the alternative and to provide the City of Bellevue with early

Draft

information to determine the viability of the alternative. The report summarizes the work completed to date. In particular, it presents the following information:

- A summary of the development of the alignment
- A summary of the planning of the A-2 Station
- A summary of the findings of early screening:
  - Cost estimate
  - Ridership
  - Environmental impacts
  - Property and RoW impacts
  - Noise impacts
  - Transportation and traffic impacts at the station location
- The finding of the study of options in the BNSF corridor
- Overview of stakeholder and public involvement in the study

Draft

1.3 "Apples-to-apples" comparison

Direction from the City Council is to develop a B7-Revised alternative that can be compared directly with the B7 and C9T alternatives developed by Sound Transit in the DEIS and SDEIS. To achieve this, the alignment uses Sound Transit's design criteria and was screened using similar methodologies to Sound Transit's. Sound Transit worked with the project team to run the ridership model and to provide input to, and review of, all aspects of the study.

Areas of the study for which the project team was directed to adopt a different approach to that adopted by Sound Transit are as follows:

Traffic modeling – The City directed the team to adopt the BKR model for traffic generation rather than the Puget Sound Regional Council model adopted by Sound Transit because the BKR Model has greater detail for the localized road network and traffic analysis zones. The BKR Model was used on both B7/C9T and B7-Revised alternatives to allow an "Apples to Apples" comparison between the two alternatives.

- BNSF Corridor – the City directed the team to develop two alternatives
  1. Shared tracks, in which future freight operations would share the light rail tracks
  2. Freight corridor, in which a freight corridor is provided alongside the light rail tracks to allow a dedicated freight line in the future

  Option 1 does not provides a future trail through the corridor. Option 2 provides the space to allow a trail to be established alongside the light rail tracks.

1.4 Supporting documents

The concept design and early assessments, the comparison of options in the BNSF corridor, and reports on the open houses are presented in a series of technical memos and reports that should be referred to in conjunction with this report:

- Open House 1 Report (RP01)
- Open House 2 Report (RP02)
- Existing Information (TM01)
- Design Deviations (TM02)
- A-2 Station Concept (TM03)

- Early Concept Alignment (TM06)
- LRT Ridership (TM07)
- Right of Way (TM08)
- Noise Impact Assessment (TM09)
- Early Environmental Screening (TM10)
- Early Cost Estimate (TM11)
- Shared Track with Freight Rail (TM12)
- B7-Revised Optimization (TM13)
- BNSF Corridor: Additional Freight Corridor Option (TM14)

Draft

2 Alternative development

2.1 Council direction

Council direction for the development of the B7-Revised alternative is to identify the optimum location for an alignment utilizing the East Link DEIS B7 alignment and the C9T with a NE 2nd Street portal as a base, with the following modifications:

- Near the Bellevue Way/I-90 interchange, add the KPFF “A-2” Station and park-and-ride and adjust the B7 light rail line as needed to meet station requirements and to provide connectivity from park-and-ride
- On the BNSF RoW, based on independent legal analysis of rail banking status, locate tracks to minimize costs (not necessary to accommodate planned regional trail)
- Exiting the BNSF corridor and traveling north on 118th Avenue SE, locate the guideway to minimize property impacts and RoW costs
- Eliminate the 118th Avenue SE Station (as in the DEIS B7 alignment)
- Add East Main Station at the existing Red Lion site, (no park-and-ride)
- On 114th Avenue SE, transition from elevated to at-grade adjacent to the Hilton Hotel and travel north under Main Street to connect to a NE 2nd Street portal compatible with the C9T tunnel alternative

2.2 B7-Revised optimization

An early review of the B7 and C9T alternatives was completed and an Optimization Meeting held with the City’s staff to identify opportunities for improving the alternative and to discuss the constraints along the corridor. This review considered both the alignment and the A-2 Station.

2.2.1 Alignment

The alignment was discussed in five sections and the following recommendations made:

1. **South Bellevue Way/Station location:** A number of alignment alternatives were proposed to accommodate potential station locations and, for the A-2 Station, balance the proximity to the park-and-ride location with alignment criteria. The selected option seeks to minimize the length of the connection to the park-and-ride and to reduce the span of the viaduct over I-90.
2. **Mercer Slough Crossing:** The B7 alterative runs within a few feet of the I-90 structures across the slough. As such, the impact on the

Draft

wetland was identified in the DEIS as de minimis. To maintain this rating, the B7-Revised alignment should be similarly close.

3 **BNSF Corridor:** the alignment through the BNSF corridor, in accordance with Council direction, is to be largely at-grade and to be optimized to reduce earthworks and retaining structures.

4 **I-405 Viaduct:** From the BNSF corridor to the East Main Station, the alignment is to consider reductions of impacts on the STOR-House property and on the Greenbaum furniture store.

5 **East Main Station:** Alternatives that were discussed for the alignment in this area included an at-grade option with a grade crossing of Main Street, an elevated alternative over Main Street, and a depressed alignment beneath Main Street. The depressed option was selected for further study to accord with the Council's direction.

2.2.2 South Bellevue Station

An Alternative Location Analysis previously commissioned by the City identified the preferred location for a station at the south of Bellevue Way between 113th Avenue SE and Bellevue Way. This location was labeled as the A-2 Station location.

A number of alternative station and park-and-ride locations and layouts were reviewed at the Optimization Meeting:

1. **Relocate the station and the park-and-ride facilities to the intersection of SE 34th Street and 112th Avenue SE:** Although this relocation would reduce the walking distance from the park-and-ride to the station platform, it was rejected for the following reasons:
    - Traffic impacts along 113th Avenue SE and potentially through Enatai would be significant
    - The parking structure would potentially be more expensive to comply with zoning
    - The bridge over I-90 would have a longer span
2. **Split the park-and-ride facilities between a 118th Avenue SE and an A-2 Station:** This alternative would remove the proposed East Main Station and reduce the size and the impact of the A-2 Station. This option was rejected for the following reasons:
    - Poorer walk/bike access to 118th, as compared with East Main
    - Potentially increased construction cost as a result of developing two sites and two elevated stations
    - Full taking of Greenbaum furniture store and adjacent properties
    - Potential traffic issues at SE 8th Street interchange with I-405

Draft

3. **Develop the A-2 Station concept at the 113th Avenue SE and South Bellevue Way location:** This option was selected as the preferred option for the following reasons:

   - Potentially lower construction costs
   - Reduced impacts on 113th Avenue SE, as compared with the SE 34th Street option
   - Less acquisition of commercial property

   The key constraints and requirements to be addressed in the development of the station were agreed in the meeting:

   - Locate the transit center on top of the structure to minimize the size of the building and to provide an open and accessible facility
   - Minimize the height of the building to reduce visual impacts from 113th Avenue SE
   - Avoid additional traffic on 113th Avenue SE

2.3 Concept design

The concept design developed for the alignment and the A-2 Station is based on the direction from council and the agreements made at the Optimization Meeting.

2.3.1 Early concept alignment

The development of the early concept alignment is described in the following eight sections (see Figure 1):

1. **I-90 Medians**

   - The I-90 crossing is optimized to minimize the span of the crossing and to locate columns in the positions that were agreed between Sound Transit and WSDOT for the B7 alternative. The A-2 Station platform is above the I-90 on- and off-ramps.

2. **A-2 Station/Park-and-Ride**

   - The alignment is adjusted to serve a center platform configuration.
   - The alignment is optimized within constraints of the station track alignment criteria to reduce platform height.
   - The station location will require additional safety measures to protect running traffic while construction work is completed overhead.

3. **Mercer Slough Crossing**

   - The alignment is located close to the I-90 structures to minimize environmental impacts. East of the station, the alignment is lowered to reduce the height of the structure and reduce cost.

Draft

- The construction of the viaduct across Mercer Slough either uses a trestle, as proposed by Sound Transit for the B7 alternative, or an overhead gantry, which minimizes the impacts of construction on the wetland.
- WSDOT has expressed concern regarding the temporary and permanent impacts of construction of a new viaduct close (within 50 feet) to the existing I-90 bridges, which appear to have been damaged by movement of the peat in the slough. Further analysis will be required to finalize the foundation solution to avoid impacts to the existing I-90 structures.

4. BNSF Corridor

- Two options are considered in this section:
    - Shared tracks – Light rail tracks are provided. Provision is made to allow future freight to share these tracks.
    - Freight corridor – An 18-foot-wide corridor alongside the light rail tracks is provide to allow development of a dedicated future freight line.
- The vertical and horizontal alignments are optimized to minimize the extent of earthworks, retaining walls, and property impacts.

5. I-405 Viaduct

- The alignment at the STOR-House self-storage unit is located alongside the I-405, crossing the east side of the property. It avoids direct impact on the building and piers are placed to avoid impact on the building's access. The piers impact the I-405 gabion retaining wall, which will require stabilization and local replacement.
- Several options were considered to minimize impacts on the Greenbaum furniture store. However, the constraints of the I-405 masterplan, and the efficiencies gained through reducing the span of the skew crossings of 118th Avenue SE, combined to dictate an alignment that passes over the eastern edge of the building. Sound Transit's policy is not to cross over existing buildings, and therefore modifications of the building will be required to maintain the business in place.

6. Sturtevant Creek

- Both at-grade/retained fill and elevated options were considered in the area of the creek. The assessment presented to the City indicated significant cost savings associated with the at-grade option and indicated that impacts and permitting issues were similar. As a result, the City agreed to proceed with the at-grade option.

Draft

- The at-grade/retained fill alignment requires some relocation of streambed and environmental mitigation, and a short bridge across the stream to avoid extension of the I-405 culvert.

I-405 Viaduct
STOR-House Storage
BNSF Corridor
Future Freight Connection
A2 Station/Park-and-Ride
Segment A
Mercer Slough Crossing
I-90 Median

Figure 2 - B7-Revised alternative

7. East Main Station and Portal

- Locations considered for the East Main Station included the Red Lion Hotel and the Sheraton Hotel Site. Options were considered to avoid full takings of the hotels. However, alignment criteria that apply at station platforms and the constrained nature of the sites resulted in impacts to the buildings and would result in significant construction impacts. Because the acquisitions of the hotels cannot be avoided if the station is located in this area, the alignment across the Red Lion and Sheraton Hotel Sites is selected to provide a direct alignment and to locate the portal for the cut-and-cover tunnel, at the corner of 112th Avenue NE and NE 2nd Street.

8. **Link to Segment C**
    - The area of study is extended beyond the tunnel portal to tie into the C9T alignment at the proposed Bellevue Transit Center station.
    - The vertical alignment is constrained on the west side of 112th Avenue NE by the minimum depth required to accommodate the tunnel structure, utilities and road construction. The vertical alignment has a 6% grade, climbing to meet the C9T alignment at the south end of the Bellevue Transit Center station.
    - The cut-and-cover tunnel alignment is along the north side of NE 2nd Street and turns north along 110th Avenue NE to the Bellevue Transit Center station.

2.3.2 A-2 Station concept design

The elements of the A-2 Station program provided in this concept are similar to those adopted in the SDEIS for the B2M South Bellevue Station.

The following are the key elements of the station and of the park-and-ride:

- A five-level structure that includes a transit center and parking.
- A transit center on the top level (Level 5) with bus/van layover, bus/van bays, and kiss-and-ride facilities.
- Four levels of parking to accommodate up to 1,450 vehicles.
- A terraced parking structure, with a structure height above ground of less than 15 feet, to reduce visual impacts along 113th Avenue SE.
- A new road bridge over the I-90 ramps to tie into A-2 Station and 113th Avenue SE, without crossing Bellevue Way at-grade.
- A ramp on the east side of the facility to link to the Level 5 transit center.
- A pedestrian/bicycle path attached to the road bridge and a ramp to provide access from the east side of Bellevue Way. One dedicated entry/exit point at Level 4 from the east side ramp, one entry point at Level 3 on the north end of the facility that allows “right-in” movements only, and an exit point at Level 3 onto 113th Avenue SE.
- A partially signalized junction of SE 30th Street and Bellevue Way that controls the southbound Bellevue Way traffic and the eastbound SE 30th Street movements onto the I-90 on-ramps.
- An acceleration lane on Bellevue Way for northbound traffic leaving the parking facility.

Draft

- A pocket lane on Bellevue Way for northbound traffic entering the parking facility.
- Access to the Mercer Slough Park and to the boat ramp.

A visualization of the concept for the station is presented in Figure 3.

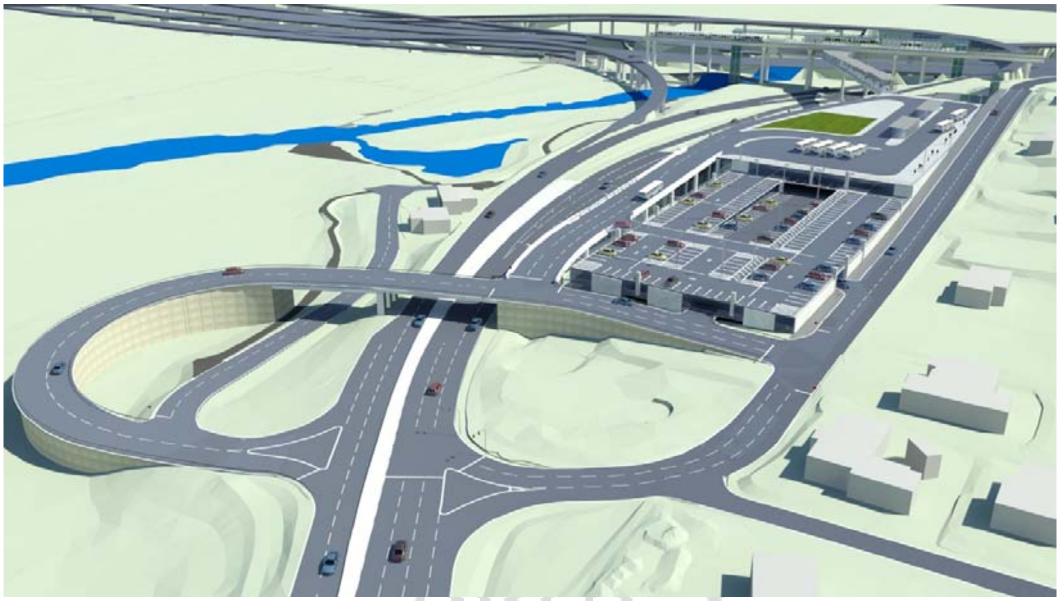

Figure 3- Visualization of A-2 Station concept looking south-east from above Bellevue Way towards I-90

Draft

2.4 BNSF corridor options

The BNSF corridor along I-405 is typically 100 feet wide, except at the south end where it reduces to 50 feet wide. When the corridor was abandoned, it became subject to a rail banking agreement that requires the corridor to be maintained so that rail services can use the corridor in the future and a trail can be accommodated in the interim.

Two options are considered through the BNSF corridor.

- **Shared tracks:** Two light-rail tracks are provided (to accommodate LRT in both directions), and future freight operations would use one of the light rail tracks. Although shared tracks such as this have been used on other systems, such use is relatively rare.

  The need for temporal separation of light rail operations and freight operations on the track would impose significant operational constraints on both Sound Transit and on any future freight operator. Additional cost are applied to the typical light rail costs to provide infrastructure that will accommodate both operations, and future costs will be required to upgrade rail systems and rolling stock when the freight operation is implemented.

- **Light rail with freight corridor:** A corridor is established alongside the light rail tracks to allow a dedicated freight line to be established in the future.

  An 18-foot corridor, typically with 27.5 feet between track centers is adopted for this option. The provision of this wider corridor allows light rail and freight to operate simultaneously but increases construction costs and impacts an additional property at the south end of the corridor where the RoW is narrower.

  The 18-foot corridor is available for a trail prior to implementation of freight rail. However, a permanent trail along this corridor is not provided.

The two options are compared for cost, property impacts, environmental impacts and noise impacts in the relevant sub-sections of Section 3.

Draft

3 Early environmental screening

3.1 Introduction

The early concept alignment and A-2 Station concept has been the subject of an initial screening to determine how it compares with the Sound Transit B7 and C9T alternatives. The purpose of the screening is to allow the City Council to determine whether the study should continue to the completion of a Concept Report. For an “apples-to-apples” comparison, the screening extends north of the portal at the junction of NE 2nd Street and 112th Avenue NE, to the proposed Bellevue Transit Center station where the alignment meets the Sound Transit C9T alignment.

The following are key areas of comparison for this initial assessment:

- Project Cost (construction and RoW costs)
- Ridership
- Environmental impacts (qualitative analysis)
- Property impacts
- Traffic impacts at the A-2 Station

Further screening will be completed for the final concept report:

- Final cost estimate
- Environmental/ecology (quantitative analysis)
- Transportation for full alignment
- Visual impacts
- Constructability

A summary of the findings from the early screening is presented in the following sections. The base option considered here is for the shared track option through the BNSF corridor. Where appropriate, a comparison between the shared track and the additional freight corridor option is provided under each section.

3.2 Cost estimate

The construction cost estimate was developed in accordance with the methods used by Sound Transit for the DEIS and the SDEIS and uses the same unit rates, lump sums, contingencies and soft costs. The RoW costs were developed by Sound Transit using the property impacts identified by the project team. This approach allows an “apples-to-apples” comparison between the alternatives.

For comparison purposes, the base construction costs and RoW costs, without unallocated contingency or soft costs, are presented for the B7-Revised alternative and for the B7/C9T alternative.

Draft

$M 2007	Construction		RoW[1]

Table 1 - Base construction costs and RoW costs (without unallocated contingency or soft costs)

The following are the preliminary findings of this analysis.

3.2.1 Construction cost

- The construction cost for the B7-Revised Segment B alignment excluding stations is 14% less than that of the Sound Transit B7 alternative. These cost differences are related to a narrower width in the BNSF corridor and an alternative construction techniques for the Mercer Slough crossing.
- The A-2 Station represents a significant cost as a result of the following:
    - The location of the rail platform above existing highway on- and off-ramps
    - The excavation required to place a parking structure largely below ground to minimize visual impacts to residences along 113th Avenue SE
    - The requirement to minimize additional traffic along 113th Avenue SE resulting in the need for a bus ramp on the east side of the station
    - The grade separation of Bellevue Way crossings for northbound movements off the I-90 off-ramps.
- The cost of the A-2 Station is significantly higher than the cost savings achieved by removing 118th Station.
- The B7-Revised alternative in Segment C comprises less viaduct and tunnel length than the C9T alternative, and this represents approximately $22M savings in construction costs.

Draft

3.2.2 RoW cost

- The B7-Revised RoW costs in Segment B are lower than for B7 as a result of a reduction in full takings particularly relating to the 118th Avenue SE station and the STOR-House building
- The RoW costs in Segment C are significantly higher largely as a result of the additional acquisition of the Sheraton Hotel property
- While not part of the cost analysis, significant surplus property will remain following completion of construction in the Segment C.

The overall project cost for the B7-Revised alternatives and the cost for the B7 and C9T alternatives, including soft costs and contingency calculated in the same manner as Sound Transit, are presented below for Segment B and for the portion of Segment C that is south of the Bellevue Transit Center Station. These indicate a cost approximately 1% in excess of Sound Transit's B7 and C9T alternatives.

(millions, 2007 $)	**B7-Revised**	**ST B7/C9T**	**Delta**
Segment B (excl. Stations)	311.1	384.5	(73.5)
118th Avenue SE Station		129.6	(129.6)
A-2 Station	204.0		204.0
Segment B Totals	**515.10**	**$514.10**	**0.9**
Segment C Total (to Bellevue Transit Center Station)	**378.9**	**369.7**	**9.2**
Total	**894.0**	**883.8**	**10.2**

Table 2 - Overall project cost (including soft costs and contingency)

Draft

3.2.3 Additional costs

3.2.3.1 Bus operations

Maintenance and operational costs for the light rail are not considered in this analysis. However, the location of the A-2 Station increases travel times for bus service, which increases operating costs and the number of vehicles required to provide the service. The following are Sound Transit's estimates for this:

- Operating costs increases by $750,000 to $1,000,000 annually.
- Two additional buses are required to maintain headway on the service. The cost to procure the two vehicles is $1.7m (2007$). The lifespan of these vehicles is 12 years, so this capital expense is incurred every 12 years.

King County metro buses will also experience additional operational cost associated with this additional travel time. However, an estimate of these costs has not been provided.

3.2.3.2 Shared track costs

Within the BNSF corridor, the light rail tracks may be shared with a future rail operator. The civil engineering works, such as additional structural provisions and trackbed requirements, are incorporated as part of the light rail construction. Trackwork and systems equipment will be retrofitted when the freight rail is established. Such equipment includes the following:

- Turnouts north and south of the corridor
- Catenaries that can accommodate freight rail envelopes
- Integrated signaling and communication systems

These elements represent a potential future construction cost of approximately $7m. It is also possible, dependent on the type of freight rolling stock that Sound Transit rolling stock will be need to be retrofitted with new pantographs.

3.2.4 Additional freight corridor option

The provision of a dedicated freight corridor alongside the light rail tracks would increase the required earthworks and retaining structures and would increase the RoW required. The estimated additional construction cost to the project is approximately $4m. However, in comparing this with the shared track option, these costs are offset by the additional costs described above associated with accommodating two train types.

The incremental cost of providing a separate freight corridor is small compared with the operational restrictions that would be placed on the rail operators.

3.3 Ridership

Sound Transit undertook an assessment of the ridership for the B7-Revised alternative based on the input and review of the project team. The Sound Transit Ridership Model used is the same model used for the alternatives presented in the DEIS and SDEIS. For this study it is used to forecast ridership for B7-Revised and for a combined B7/C9T alternative not presented in the DEIS or SDEIS.

Draft

	B7-Revised	B7/C9T
Segment A	**5,000**	**6,000**
Segment B		
A-2 Station	4,500	
118th Station		1,500
South Bellevue Station		
SE 8th		
Segment Total	**4,500**	**1,500**
Segment C		
East Main Station	2,500	3,000
Bellevue Transit Center Station	4,500	5,000
Hospital Station	1,000	1,000
Segment Total	**8,000**	**9,000**
Segment D	**7,000**	**7,000**
Segment E	**3,500**	**3,500**
Project-wide ridership	**50,500**	**49,000**

Source: B7-Revised and B7/C9T ridership from Sound Transit Ridership Model, 2011.

Table 3 - Year 2030 East Link LRT daily boardings

Draft

The ridership forecasts presented above indicate that the B7-Revised alternative achieves a higher ridership, as compared with B7/C9T, largely because of higher ridership at A-2 Station.

3.4 Environmental impacts

3.4.1 Environmental and ecology

To provide an initial comparison of the B7-Revised alternative with the B7 and C9T alternatives, a largely qualitative screening of the environmental/ecological issues is presented.

Feature	B7-Revised Impacts (relative to B7 and C9T)	
	Increased impact	Reduced impact
Ecosystems resources	**A-2 Station** – Impact to additional 0.26 acres of wetland and 0.18 acres of wetland buffer at vehicle ramp. About 0.26 acres of additional shading from station platform. **A-2 Station** – Aquatic habitat: potential runoff during construction to Slough **Sturtevant Creek** – Greater impact to fish habitat and increased mitigation required	**Mercer Slough** – Proposed gantry construction would reduce construction impacts
Water resources	**A-2 Station** – Adds 4.1 acres of pollutant-generating impervious surface (PGIS)	**Removal of 118th Station** – Reduction is less than 2.9 acres – exact number not obtained from ST.
Visual	**A-2 Station** – Impact from 113th Avenue SE, including light spillover	**Removal of 118th Station** – reduces visual impacts **East Main Station** – placing station partly below grade reduces visual impacts
Section 4(f) and 6(f)	**A-2 Station** – Additional 0.26 acres of Mercer Slough Nature Park impacted by vehicle ramp	

Table 4 - B7-Revised environmental ecological impacts (relative to B7/C9T)

Draft

3.4.2 Noise

To identify the noise impacts and the required mitigations for the alternative, independent noise monitoring was carried out to compare with and to supplement the monitoring carried out by Sound Transit. An independent noise model was developed in accordance with FTA guidelines and was used to predict noise levels along the route. These predictions were then used to identify mitigations that would be necessary.

The analysis shows 237 impacts compared with 182 for B7 and C9T. These are related to new areas of impacts not identified in the DEIS/SDEIS and to variations in the alignment increasing impacts. Some additional mitigation will be required and will reduce the mitigated impacts to zero.

3.4.3 Additional freight corridor option

The wider corridor proposed for the freight option represents no significant change in impacts to environmental resources.

At SE 32nd Street, the alignment is up to 25 feet closer to a business to the west of the corridor. This would increase the unmitigated impacts to the property but is unlikely to change the mitigation requirements proposed for the shared track option.

3.5 Property impacts and Right of Way

The alignment has been developed where possible, to reduce the impacts on existing property. A comparison of property impacts between the B7-Revised alternative and the B7 and C9T alternatives is provided below:

Draft

	B7-Revised (to Bellevue Transit Center)				**B7/C9T (to Bellevue Transit Center)**		
	Segment B		**Segment C**	**Total**	**Segment B**	**Segment C**	**Total**
	Excluding A-2 Station	**A-2 Station**					
Total Impacted Private Properties	8	13	14	35	17	17	34
Partial Acquisitions	7	0	3	10	9	8	17
Full Acquisitions	1	13	11	25	8	9	17
Business Relocations	1	0	8	9	6	8	14
No. Employees Displaced	15	0	200	215	180	88	268
Residential Relocations	0	12	0	12	0	0	0
Acres of Public Park Land Impacted	1.86 ac	0.47 ac	0 ac	2.33 ac	0.9 ac perm. 1.6 ac temp. [Mercer Slough Nature Park]	0.1 ac perm. 0.1 ac temp. [NE 2nd Place Pocket Park]	1.0 ac perm. 1.7 ac temp.
Acres of BNSF Corridor	8.42 ac	0	0	8.42 ac	8.42 ac	0	0

Table 5 - Table of property impacts

The key differences between the B7-Revised and B7/C9T alternatives are as follows:

- The property impacts of the B7-Revised alterative as categorized in the table above are similar to the B7 and C9T alternatives.
- Twelve additional residential properties would be acquired at the A-2 Station.

- Additional WSDOT RoW is required at the A-2 Station site
- The alignment is relocated to the east of the B7 alignment to avoid a full acquisition of the STOR-House storage unit north of the BNSF corridor.
- The alignment is moved to the east of the B7 alignment to reduce impact on the Greenbaum property. The new alignment crosses over the extreme east corner and will require some reconstruction to the property to satisfy Sound Transit requirements and access issues.
- The removal of the 118th Avenue SE station removes three commercial property acquisitions.
- Alignment criteria associated with the East Main Station require full acquisition of the Red Lion and Sheraton Hotels and the Azteca Restaurant.
- Properties along the north side of NE 2nd Street will be acquired. These acquisitions are partially offset by those required along Main Street for the C9T alternative.

3.6 Transportation and traffic impacts

At this interim stage in the project, traffic impacts are assessed only around A-2 Station for the B7-Revised alternative and the B7 and C9T alternatives. At the request of the City of Bellevue, traffic analysis was conducted using the Bellevue/Kirkland/Redmond (BKR) model (the DEIS/SDEIS traffic analyses used the Puget Sound Regional Council model). The year analysis adopted for the study was 2030 which is consistent with Sound Transit's analysis. Synchro was then applied to determine the level of service (LOS) at each of the three intersections studied around the A-2 Station.

Key traffic findings are as follows:

- Without traffic enhancements for the B7-Revised alternative, traffic from SE 30th Street onto the I-90 ramps would experience significant delays from heavy southbound Bellevue Way volumes in the PM peak period.
- Several traffic enhancements are recommended to improve traffic operations and to achieve City of Bellevue LOS standards once the A-2 Station becomes functional:
  - A ramp access from the east side of Bellevue Way into the station to avoid left turns on Bellevue Way
  - Partial signal at Bellevue Way / SE 30th Street for the southbound movements onto the I-90 on-ramps (the northbound movement from the I-90 off-ramps would be unaffected)
  - Second right-turn lane from SE 30th Street onto southbound Bellevue Way
  - Third southbound travel lane on Bellevue Way both north and south of the SE 30th Street intersection

Draft

  - Right turn pocket on northbound Bellevue Way prior to the new road bridge over the I-90 ramps
  - Acceleration lane in the northbound Bellevue Way direction north of the new road bridge over the I-90 ramps
- These improvements were discussed with WSDOT. Further analysis will be required to justify these improvements, particularly the signalization; however, no fatal flaw were identified at this stage.

The proposed traffic enhancements would achieve the following:

- The new partial signal at SE 30th Street and Bellevue Way would operate at LOS B. Southbound traffic on Bellevue Way would be delayed by an average of 16 seconds, whereas previously traffic operated at free-flow conditions in the PM peak.
- Travel time from SE 10th Street to SE 30th Street would increase by an average of 20 seconds
- Bus travel times for B7-Revised would be longer than those for B7/C9T. The longer travel times would increase operating costs and would require two additional buses to provide service. Northbound buses would experience a 3.5-minute increase in travel time, while southbound buses would experience a 2.5-minute increase in travel time.
- Neighborhood cut through traffic to A-2 Station through Enatai is not expected to be significant based on the modeling completed.

Draft

4 Stakeholder and community involvement

4.1 Sound Transit

Sound Transit is an important stakeholder in the development of the study. A cooperative relationship was established to facilitate an ‘Apples-to-Apples” comparison between the B7-Revised alternative and the Sound Transit B7 and C9T alternatives. In particular Sound Transit:

- Provided base information including alignments files, design criteria and RoW and cost estimating approach
- Operated the ridership model
- Attended a number of meetings to discuss issues of ridership, cost estimating, RoW and A-2 Station and park-and-ride planning
- Reviewed draft technical memoranda and estimates
- Provided input to the A-2 transit center design to address the requirements of Sound Transit Express bus operations, and provided data on additional operational costs

4.2 King County Metro

King County operates a number of the buses that will serve the A-2 Station. A joint meeting with Sound Transit was held to discuss the planning of the transit center. The key elements of the discussion related to:

- Travel delays for bus services
- Layout of the transit center and park-and-ride

4.3 WSDOT

Much of the alignment runs alongside, through or over WSDOT property and facilities. Three meetings were held with WSDOT to discuss the alignment and the potential impacts to WSDOT property. The key elements of the discussion were:

- Traffic operations on Bellevue Way
- Construction of the A-2 Station over the I-90/Bellevue Way ramps
- Construction of the viaduct over the Mercer Slough and potential impacts to the existing I-90 structures
- Construction adjacent to the I-405 and potential impacts to the retaining wall adjacent to the STOR-House property
- Coordination with the I-405 masterplan.

Draft

4.4 Public involvement

Two public Open Houses were conducted to inform the community and to obtain community input on the study. The first Open House was held at City Hall on January 25, 2011. It attracted 185 attendees and generated over 220 comments. The Open House was held early in the study and presented the broad alignment. The public provided comments in several ways, including post-it notes on the plans/maps, on comment forms, and in subsequent correspondences such as email.

The second Open House was held at City Hall on March 8, 2011 and presented the early conceptual alignment and planning of the A-2 Station and the park-and-ride. A 15-minute presentation highlighted the key areas of the completed work. A total of 230 members of the public from various neighborhoods attended; over 210 comments were received.

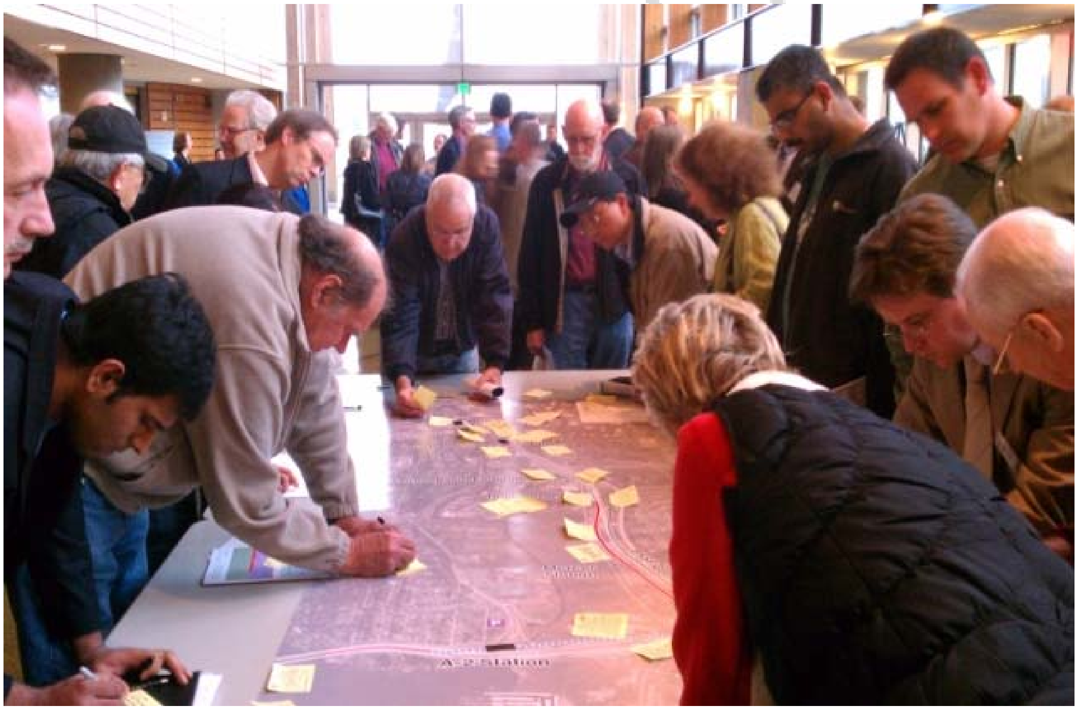

Figure 4 - March 2011 Open House

5 Risk and opportunities

In developing the Early Concept Alignment, a number of risks and opportunities have been identified that may impact the project schedule or project costs.

5.1 Risks

A-2 Station – The construction of the A-2 Station above the Bellevue Way/I-90 ramps will require careful planning and liaison with WSDOT to agree closures etc. This could affect the project schedule.

Mercer Slough – The crossing of the Mercer Slough is challenging as a result of: the environmentally sensitive nature of the Slough; the poor foundation materials; the movement of the peat as documented by WSDOT; and WSDOTs concerns regarding protection of their existing I-90 structures. While two construction methods have been developed, further analysis will be required to define the appropriate solution and to satisfy WSDOT concerns. This could potentially delay the project and add construction cost.

Sturtevant Creek – The permitting issues associated with the relocation and mitigation of the creek bed could increase the project schedule and cost

Draft

5.2 Opportunities

The following adjustments to the alternative requested by Council could potentially reduce the cost of the project.

Opportunity	**Impacts**	**Approximate Potential Cost Savings**
Adjust I-405 Masterplan's location of 118th Avenue to allow alignment to avoid Greenbaum site	Negotiation with WSDOT required	Potential RoW savings $1m
Remove East Main Station	Reduces ridership by approx. 1000 May allows improved alignment at Red Lion and reduce impacts on Sheraton Hotel	Station cost =~ $40m RoW (Sheraton) = ~$20m
Use mechanically stabilized walls for retained fill	Reduced cost, but not "apples to apples" with ST	$5m
Use corridor estimate approach for BNSF corridor	Not "apples-to-apples" with ST	$10m
Assess residual value	Not "apples-to-apples" with ST	At 2 hotels and along NE 2nd Street ~ 50m

Table 6 - Potential opportunities

6 Preliminary findings

Preliminary findings are as follows:

The B7-Revised is a feasible alternative that improves ridership over the B7/C9T alternative but has a higher overall project cost. The alternative has similar property impacts and has a number of additional environmental impacts relative to the B7 and C9T alternatives. A summary of the early screening analysis is provided below.

Features	**B7-Revised**	**B7/C9T**
Estimated cost (millions, 2007 $)	$894.0	$883.8
2030 Daily Ridership (project-wide)	50,500	49,000
Noise-impacted receptors - unmitigated (mitigated)	237 (0)	182 (0)
Residential displacements (number of housing units)	12	0
Business displacements (number of employees)	215	268
Full/partial property acquisitions	35	34
Wetlands/wetland buffer affected (acres)	1.8/0.8	2.1/1.0
Parks/Section 4(f) and 6(f) (acres before mitigation)	1.1	1.3

Table 7 - Summary of B7-Revised preliminary findings

Draft

- The most substantial environmental differentiators of B7-Revised compared with B7/C9T are the following:
    - More wetland and park impacts associated with the A-2 Station and park and ride
    - More pollutant-generating impervious surface related to A-2 Station and park-and-ride
    - Change in visual quality overall at the A-2 Station and park-and-ride
    - More disturbance of special-status fish species and good quality stream habitat in Sturtevant Creek
- The A-2 Station requires a number of mitigation measures at Bellevue Way:
    - Ramp access into station from east side of Bellevue Way
    - Additional right-turn lane at north end of SE 30th Street
    - Traffic signal to control the southbound and eastbound movements at the intersection of Bellevue Way and SE 30th Street
    - Third lane on the southbound approach on Bellevue Way to SE 30th Street

  - Pocket lane on Bellevue Way northbound south of station access
  - Acceleration lane onto Bellevue Way northbound
- The provision of a dedicated freight corridor in the BNSF corridor represents a similar cost to the shared track scheme and provides fewer restrictions on Sound Transit and the freight operator in operating in the corridor.
- The construction method for the Mercer Slough crossing will require further work to develop a robust solution and to address WSDOTs concerns regarding risk to their existing facilities.
